One method of preventing the neceſſity of ſurging, by placing a horizontal roller beneath the meſſenger when it firſt enters on the capſtan, adds conſiderably to the labour in turning the capſtan, and the great friction which the meſſenger muſt ſuffer, muſt occaſion a very great wear and injury to the meſſenger.

Another method to prevent ſurging was, that for which Mr Plucknet obtained a patent. In this way a number of upright lifters, placed round the capſtan, were made to riſe in ſucceſſion as the capſtan turned round by a circular inclined plane placed beneath them; a method Mr Boſwell thinks ſuperior to the former; but ſtill the wear of the meſſenger from the lateral friction in riſing againſt the whelps of the capſtan remains undiminiſhed.

A third method propoſed by Captain Hamilton, left the lateral friction, and wear of the meſſenger againſt the whelps of the capſtan, as great as in the others, having alſo the inconvenience of cauſing the coils to become looſe as they aſcend, the upper part of the barrel being nearly one third leſs in the diameter than the lower part.

In Mr Boſwell's method of preventing the neceſſity of ſurging, none of the lateral friction of the meſſenger or cable againſt the whelps of the capſtan, can poſſibly take place, and of courſe the wear of the meſſenger occaſioned thereby will be entirely avoided, while it performs its purpoſe with a leſs moving power than any of them.

His method conſiſts in the ſimple addition of a ſecond ſmaller barrel or capſtan of leſs dimenſions to the large one; beſide which it is to be placed in a ſimilar manner, and which need not in general exceed the ſize of a half barrel caſk. The coils of the meſſenger are to be paſſed alternately round the large capſtan and this ſmall barrel, but with their direction reverſed in the different barrels, ſo that they may croſs each other in the intervals between the barrels, in order to have the more extenſive contact with, and better gripe on each barrel. To keep the coils diſtinct, and prevent their touching each other in paſſing from one barrel to the other, projecting rings are faſtened round each barrel at a diſtance from each other equal to about two diameters of the meſſenger, and the thickneſs of the ring. Thoſe rings ſhould be ſo fixed on the two barrels that thoſe on one barrel ſhould be exactly oppoſite the middle of the intervals between thoſe on the other barrel; the only circumſtance which requires particular attention in the conſtruction of this capſtan. The rings ſhould project about as much as the meſſenger from the barrels, which may be formed with whelps, and in every other reſpect, not before mentioned, in the uſual manner for capſtan barrels. The ſmall barrel ſhould be furniſhed with falling palls as well as the large one; a fixed iron ſpindle aſcending from the deck will be the beſt for it, as it will take up leſs room. The ſpindle may be ſecured below the deck, ſo as to bear any ſtrain, as the ſmall barrel need not be much above half the height of the large barrel; the capſtan bars can eaſily paſs over it in heaving round, when it is thought fit to uſe capſtan bars on the ſame deck with the ſmall barrel. As two turns of the meſſenger round both barrels will be at leaſt equivalent to three turns round the common capſtan, it will ſcarcely ever be neceſſary to uſe more than four turns round the two barrels.

That which prevents the lateral friction of the meſſenger in Mr Boſwell's double capſtan is, that in it each coil is kept diſtinct from the reſt, and muſt paſs on to the ſecond barrel before it can gain the next elevation on the firſt, by which no one coil can have any influence in raiſing or depreſſing another; and what each ſeparate coil deſcends in a ſingle revolution it regains as much as is neceſſary in its paſſage between the barrels when in the air, and free from all contact with any part of the apparatus, it attains a higher elevation without a poſſibility of friction or wear.

It is equally applicable in large and in ſmaller veſſels, in the former of which meſſengers are neceſſary, from the ſize of the cables; but in the latter alſo, where cables can be managed with the ſame eaſe as meſſengers. The ſame principle may be alſo eaſily applied to windlaſſes by having a ſmall horizontal barrel placed parallel to the body of the windlaſs, and having both fitted with rings in the ſame way as is propoſed for the capſtan. The place for the ſmall horizontal barrel is forward, juſt before the windlaſs, and it ſhould alſo be furniſhed with catch polls.

Beſides the advantages now ſtated, the improved capſtan is ſimple in its conſtruction can be fitted up at ſmall expence, is eaſily repaired, and requires but little room.

A repreſents the common capſtan; B, another of ſmaller dimenſions; C the coils of the meſſenger paſſing alternately round the large and ſmall capſtans, but with the dieection reverſed on the different barrels, ſo that they may croſs each other in the interval between them; DDDD, are projecting rings round each barrel, ſo fixed on the two barrels, that thoſe on one barrel ſhould be exactly oppoſite the middle of the intervals between thoſe on the other barrel. Plate cccexciv.

Machine for meaſuring a SHIP's Way.—We have already deſcribed a variety of machines or inſtruments which have been propoſed for this purpoſe under the article LOG. In this place, therefore, we ſhall confine ourſelves to the machine invented by Francis Hopkinſon, Eſq. Judge of the Admiralty in Pennſylvania.— After having ſhown the fallacies to which the common log, and alſo that particular kind of inſtrument invented by M. Saumarez, are liable, he proceeds to deſcribe his own machine as follows: *Tranſactions of the American Philoſophical Society*, vol. ii. p. 160.

This machine, in its moſt ſimple form, is repreſented by fig. 5. wherein AB is a ſtrong rod of iron moveable on the fulcrum C. D is a thin circular palate of braſs rivetted to the lower extremity of the rod. E a horizontal arm connected at one end with the top of the rod AB by a moveable joint F, and at the other end with the bottom of the index H, by a like moveable joint G. H is the index turning on its centre I, and travelling over the graduated arch K; and L is a ſtrong ſpring, bearing againſt the rod AB, and conſtantly counteracting the preſſure upon the palate D. Plate cccclxxxiii. Fig. 5.

The

Ship. The rod AB should be applied close to the cut-water or stem, and should be of such a length that the palate D may be no higher above the keel than is necessary to secure it from injury when the vessel is aground, or sails in shoal water. As the bow of the ship curves inward towards the keel M, the palate D will be thrown to a distance from the bottom of the vessel, although the perpendicular rod to which it is annexed lies close to the bow above; and therefore the palate will be more fairly acted upon. The arm E should enter the bow somewhere near the hawse hole, and lead to any convenient place in the forecastle, where a smooth board or plate may be fixed, having the index H, and graduated arch K, upon it.

It is evident from the figure, that as the ship is urged forward by the wind, the palate D will be pressed upon by the resisting medium, with a greater or less force, according to the progressive motion of the ship; and this will operate upon the levers so as to immediately affect the index, making the least increase or diminution of the ship's way visible on the graduated arch; the spring L always counteracting the pressure upon the palate, and bringing back the index, on any relaxation of the force impressed.

This machine is advantageously placed at the bow of the ship, where the current first begins, and acts fairly upon the palate, in preference to the stern, where the tumultuous closing of the water causes a wake, visible to a great distance. The palate D is sunk nearly as low as the keel, that it may not be influenced by the heaping up of the water and the dashing of the waves at and near the water line. The arch K is to ascertain how many knots or miles she would run in one hour at her then rate of sailing. But the graduations on this arch must be unequal; because the resistance of the spring L will increase as it becomes more bent, so that the index will travel over a greater space from one to five miles than from five to twelve. Lastly, The palate, rod, spring, and all the metallic parts of the instrument, should be covered with a strong varnish, to prevent rust from the corrosive quality of the salt water and sea air.

This machine may be considerably improved as follows: Let the rod or spear AB (fig. 5.) be a round rod of iron or steel, and instead of moving on the fulcrum or joint, as at C, let it pass through and turn freely in a socket, to which socket the moveable joint must be annexed, as represented in fig. 6. The rod must have a shoulder to bear on the upper edge of the socket, to prevent its slipping quite down. The rod must also pass through a like socket at F, fig. 5. The joint of the lower socket must be fixed to the bow of the ship, and the upper joint or socket must be connected with the horizontal arm E. On the top of the uppermost socket let there be a small circular plate, bearing the 32 points of the mariner's compass; and let the top of the rod AB come through the centre of this plate, so as to carry a small index upon it, as is represented in fig. 7. This small index must be fixed to the top of the rod on a square, so that by turning the index round the plate, the rod may also turn in the sockets, and of course carry the palate D round with it; the little index always pointing in a direction with the face of the palate. The small compass plate should not be fastened to the top of the socket, but only fitted tightly on, that it may be moveable at pleasure. Suppose then the intended port to bear S. W. from the place of departure, the palate must be turned on the socket till the south-west point thereon looks directly to the ship's bow; so that the south-west and north-east line on the compass plate may be precisely parallel with the ship's keel, and in this position the plate must remain during the whole voyage. Suppose, then, the ship to be sailing in the direct course of her intended voyage, with her bowsprit pointing south-west. Let the little index be brought to the south-west point on the compass plate, and the palate D will necessarily present its broad face toward the port of destination; and this it must always be made to do, be the ship's course what it may. If, on account of unfavourable winds, the ship is obliged to deviate from her intended course, the little index must be moved so many points from the south-west line of the compass plate as the compass in the binnacle shall show that she deviates from her true course; so that in whatever direction the ship shall sail, the palate D will always look full to the south-west point of the horizon, or towards the port of destination, and consequently will present only an oblique surface to the resisting medium, more or less oblique as the ship deviates more or less from the true course of her voyage. As, therefore, the resistance of the water will operate less upon the palate in an oblique than in a direct position, in exact proportion to its obliquity, the index H will not show how many knots the vessel runs in her then course, but will indicate how many she gains in the direct line of her intended voyage.—Thus, in fig. 9. if the ship's course lies in the direction of the line AB, but she can sail by the wind no nearer than AC; suppose, then, her progressive-motion such as to perform AC equal to five knots or miles in an hour, yet the index H will only point to four knots on the graduated arch, because she gains no more than at that rate on the true line of her voyage, viz. from A to B. Thus will the difference between her real motion and that pointed out by the index be always in proportion to her deviation from her intended port, until she sails in a line at right angles therewith, as AD; in which case the palate would present only a thin sharp edge to the resisting medium, the pressure of which should not be sufficient to overcome the friction of the machine and the bearing of the spring L. So that at whatever rate the ship may sail on that line, yet the index will not be affected, showing that she gains nothing on her true course. In this case, and also when the vessel is not under way, the action of the spring L should cause the index to point at O, as represented by the dotted lines in fig. 5. and 8.

As the truth of this instrument must depend on the equal pressure of the resisting medium upon the palate D, according to the ship's velocity, and the proportionable action of the spring L, there should be a pin or screw at the joints C and F, so that the rod may be readily unshipped and taken in, in order to clean the palate from any foulness it may contract, which would greatly increase its operation on the index H, and thereby render the graduated arch false and uncertain.

Further, the spring L may be exposed too much to injury from the salt water, if fixed on the outside of the ship's bow. To remedy this, it may be brought under cover, by constructing the machine as represented by fig. 8. where AB is the rod, C the fulcrum or centre of of its motion, D the palate, E the horizontal arm leading through a ſmall hole into the forecaſtle; M is a ſtrong chain faſtened at one end to the arm E, and at the other to a rim or barrel on the wheel G, which by means of its teeth gives motion to the ſemicircle I and index H. The ſpring L is ſpiral, and encloſed in a box or barrel, like the main-ſpring of a watch. A ſmall chain is fixed to, and paſſing round the barrel, is faſtened by the other end to the fuzee W. This fuzee is connected by its teeth with the wheel G, and counteracts the motion of the palate D. N, N, are the two ſockets through which the rod AB paſſes, and in which it is turned round by means of the little index R. S is the ſmall compaſs plate, moveable on the top of the upper ſocket N. The plate S hath an upright rim round its edge, cut into teeth or notches, ſo that when the index R is a little raiſed up, in order to bring it round to any intended point, it may fall into one of theſe notches, and be detained there; otherwiſe the preſſure of the water will force the palate D from its oblique poſition, and turn the rod and index round to the direction in which the ſhip ſhall be then ſailing.—Should it be apprehended that the palate D, being placed ſo far forward, may affect the ſhip's ſteerage, or obſtruct her rate of ſailing, it ſhould be conſidered that a very ſmall plate will be ſufficient to work the machine, as one of three or four inches in diameter would probably be ſufficient, and yet not large enough to have any ſenſible effect on the helm or ſhip's way.

The greateſt difficulty, perhaps, will be in graduating the arch K, (if the machine is conſtructed as in fig. 5.); the unequal diviſions of which can only be aſcertained by actual experiment on board of each ſhip reſpectively, inaſmuch as the accuracy of theſe graduations will depend on three circumſtances, viz. the poſition of the fulcrum C with reſpect to the length of the rod, the ſize of the palate D, and the ſtrength or bearing of the ſpring L. When theſe graduations, however, are once aſcertained for the machine on board of any one veſſel, they will not want any future alterations, provided the palate D be kept clean, and the ſpring L retains its elaſticity.

But the unequal diviſions of the graduated arch will be unneceſſary, if the machine is conſtructed as in fig. 8; for as the chain goes round the barrel L, and then winds through the ſpiral channel of the fuzee W, the force of the main ſpring muſt operate equally, or nearly ſo, in all poſitions of the index, and conſequently the diviſions of the arch K may in ſuch caſe be equal.

After all, it is not expected that a ſhip's longitude can be determined to a mathematical certainty by this inſtrument. The irregular motions and impulſes to which a ſhip is continually expoſed, make ſuch an accuracy unattainable perhaps by any machinery: But if it ſhould be found, as we flatter ourſelves it will on fair experiment, that it anſwers the purpoſe much better than the common log, it may be conſidered as an acquiſition to the art of navigation.

It ſhould be obſerved, that in aſcertaining a ſhip's longitude by a time-piece, this great inconvenience occurs, that a ſmall and trifling miſtake in the time makes a very great and dangerous error in the diſtance run: Whereas the errors of this machine will operate no farther than their real amount; which can never be great or dangerous, if corrected by the uſual obſervations made by mariners for correcting the common log.

A like machine, made in its ſimple form (as at fig. 5.), ſo conſtructed as to ſhip and unſhip, might occaſionally be applied alongſide about midſhips, in order to aſcertain the leeway; which, if rightly ſhown, will give the ſhip's preciſe longitude. As to ſea currents, this and all other machines hitherto invented muſt be ſubject to their influence; and proper allowances muſt be made according to the ſkill and knowledge of the navigator.

Laſtly, Some diſcretion will be neceſſary in taking obſervations from the machine to be entered on the log-book: that is, the moſt favourable and equitable moment ſhould be choſen for the obſervation; not whilſt the ſhip is rapidly deſcending the declivity of a wave, or is ſuddenly checked by a ſtroke of the ſea, or is in the very act of plunging. In all caſes, periods may be found in which a ſhip proceeds with a true average velocity; to diſcover which, a little experience and attention will lead the ſkilful mariner.

It has been obſerved of the machine now deſcribed, that an ingenious mechanic would probably conſtruct it to better advantage in many reſpects. The author only meant to ſuggeſt the principle; experiment alone can point out the beſt method of applying it. He is ſenſible of at leaſt one deficiency, viz. that the little index R, fig. 4. will not be ſtrong enough to retain the palate D in an oblique poſition when the ſhip is ſailing by the wind; more eſpecially as the compaſs plate S, in whoſe notched rim the index R is to fall, is not fixed to, but only fitted tight on the ſocket N. Many means, however, might be contrived to remedy this inconvenience.

SHIP-Wreck. A French author has lately propoſed ſome methods of ſaving the lives of perſons ſhipwrecked near the coaſt. He obſerves, that the moſt proper means for ſaving the crews of ſhipwrecked veſſels is, to eſtabliſh a rope of communication from them to the ſhore. To a bomb or cannon ball ſhould be faſtened the end of a rope, extended afterwards in a zig-zag direction before the mortar or cannon, or ſuſpended on a piece of wood raiſed ſeveral feet. But as it was neceſſary to know if the cord would not break by the force of the exploſion and the velocity of the motion, the author thought it proper to conſult profeſſional men. He accordingly wrote to ſome officers of the artillery in garriſon at La Fere in France, and they almoſt all replied that the rope would infallibly break.

Not deeming this anſwer ſatisfactory, he happily conceived the idea of making the experiment on a ſmall ſcale. He cauſed a piece of the barrel of a muſket to be filed into the form of a ſmall mortar of 18 lines in length internally; and having tied a packthread to a common ball of lead, he made an experiment which perfectly ſucceeded, as did many others which he afterwards repeated, even with the ſtrongeſt charges of powder. This ſucceſs he communicated to the officers of artillery, who replied, that there was a great difference between a quarter of an ounce of powder and four or five pounds employed for a bomb; and were ſtill of opinion that the rope would break.

Having already made experiments, he was ſtill diſpoſed to doubt the truth of this aſſertion, and therefore tried a four-inch mortar with a ball of the ſame calibre, and 18 ounces of powder, with a rope only three or four

four lines in diameter, and his fuccefs was equally flattering as before. Thefe experiments were repeated by order of government at La Fere, four times with an eight-inch mortar, and three times with one of twelve inches, all of which happily fucceeded. The fame author goes on to obferve;

"It ought to be remembered, that a veffel is never caft away, or perifhes on the coaft, but becaufe it is driven thither againft the will of the captain, and by the violence of the waves and the wind, which almoft always blows from the fea towards the fhore, without which there would be no danger to be apprehended: confequently in thefe circumftances, the wind comes always from the fea, either directly or obliquely, and blows towards the fhore.

"1ft, A common paper kite, therefore, launched from the veffel and driven by the wind to the fhore, would be fufficient to fave a crew of 1500 feamen, if fuch were the number of a fhip of war. This kite would convey to the fhore a ftrong packthread, to the end of which might be affixed a cord, to be drawn on board by means of the ftring of the kite; and with this cord a rope, or as many as fhould be neceffary, might be conveyed to the fhip.

"2d, A fmall balloon, of fix or feven feet in diameter, and raifed by rarefied air, would be alfo an excellent means for the like purpofe. Being driven by the wind from the veffel to the fhore, it would carry thither a ftring capable of drawing a cord with which feveral ropes might be afterwards conveyed to the veffel. Had not the difcovery of Montgolfier produced any other benefit, it would be entitled on this account to be confidered as of great importance.

"3dly, A fky rocket, of a large diameter, would be of equal fervice. It would alfo carry, from the veffel to the fhore, a ftring capable of drawing a rope after it.

"Laftly, A fourth plan for faving the crew of a fhipwrecked veffel, is that of throwing from the veffel into the fea an empty cafk with a cord attached to it. The wind and the waves would drive the cafk to the fhore, and afford the means of eftablifhing that rope of communication already mentioned."

The author juft quoted fays, that he announced his difcovery in a French journal in January 1794. It is, however, to be obferved, that the method he propofes of conveying a rope to the fhore, by faftening it to a bullet or bomb, to be afterwards fired from a cannon or mortar, was propofed fome years ago by a ferjeant or officer of artillery at Woolwich, and it is faid, fimilar experiments were made at Portfmouth, and fucceeded *.

* Phil. Mag. vol. iv. p. 247.

SHIRAUZ. See SCHIRAS.

SHIRE, is a Saxon word fignifying a divifion; but a county, *comitatus*, of the fame import, is plainly derived from *comes*, "the count of the Franks;" that is, the earl or alderman (as the Saxons called him) of the fhire, to whom the government of it was entrufted. This he ufually exercifed by his deputy, ftill called in Latin *vice-comes*, and in Englifh the *fheriff*, *fhrieve*, or *fhire-reeve*, fignifying the "officer of the fhire;" upon whom, in procefs of time, the civil adminiftration of it totally devolved. In fome counties there is an intermediate divifion between the fhire and the hundred; as lathes in Kent and rapes in Suffex, each of them containing about three or four hundred a-piece. Thefe had formerly their lathe-reeves and rape-reeves, acting in fubordination to the fhire-reeve. Where a county is divided into three of thefe intermediate jurifdictions, they are called *trithings*, which were anciently governed by a trithing reeve. Thefe trithings ftill fubfift in the large county of York, where, by an eafy corruption, they are denominated *ridings*; the north, the eaft, and the weft ridings.

SHIRL, SHORL, or COCKLE, a fpecies of mineral. See MINERALOGY *Index*.

SHIRT, a loofe garment, commonly of linen, worn next the body.—Some doubt the propriety of changing the linen when a perfon is fick. Clean linen promotes perfpiration; and it may be renewed as often as the patient pleafes, whether the diforder be of the acute or the chronical kind. Except during a crifis in fevers, whilft the patient is in a fweat, a change of linen, if well dried and warmed, may be daily ufed.

Shirts were not worn by the Jews, Greeks, or Romans, but their place was fupplied by thin *tunicæ* of wool. The want of linen among the ancients made frequent wafhings and ablutions neceffary.

SHIVER, a name given by miners to fome of the ftrata which accompany coal. See SCHISTUS, MINERALOGY *Index*.

SHIVERS, in the fea language, names given to the little rollers, or round wheels of pulleys.

SHOAD, among miners, denotes a train of metalline ftones, ferving to direct them in the difcovery of mines.

SHOAD-Stones, a term ufed by the miners of Cornwall and other parts of this kingdom, to exprefs fuch loofe maffes of ftone as are ufually found about the entrances into mines, fometimes running in a ftraight courfe from the load or vein of ore to the furface of the earth.

Thefe are ftones of the common kinds, appearing to have been pieces broken from the ftrata or larger maffes; but they ufually contain mundic, or marcafitic matter, and more or lefs of the ore to be found in the mine. They appear to have been at fome time rolled about in water, their corners being broken off, and their furface fmoothed and rounded.

The antimony mines in Cornwall are always eafily difcovered by the fhoad-ftones, thefe ufually lying up to the furface, or very nearly fo; and the matter of the ftone being a white fpar, or debafed cryftal, in which the native colour of the ore, which is a fhining bluifh black, eafily difcovers itfelf in ftreaks and threads.

Shoad-ftones are of fo many kinds, and of fuch various appearances, that it is not eafy to defcribe or know them; but the miners, to whom they are of the greateft ufe in the tracing or fearching after new mines, diftinguifh them from other ftones by their weight; for if very ponderous, though they look ever fo much like common ftones, there is great reafon to fufpect that they contain fome metal. Another mark of them is their being fpongy and porous; this is a fign of efpecial ufe in the tin countries; for the tin fhoad-ftones are often fo porous and fpongy, that they refemble large bodies thoroughly calcined. There are many other appearances of tin fhoads, the very hardeft and firmeft ftones often containing this metal.

When the miners, in tracing a fhoad up hill, meet with fuch odd ftones and earths that they know not well what to make of them, they have recourfe to vanning, that is, they calcine and powder the ftone, clay, or whatever elfe is fuppofed to contain the metal; and then

then wafhing it in an inftrument, prepared for that purpofe, and called a *vanning fhovel*, they find the earthy matter wafhed away, and of the remainder, the ftony or gravelly matter lies behind, and the metalline matter at the point of the fhovel. If the perfon who performs this operation has any judgement, he eafily difcovers not only what the metal is that is contained in the fhoad, but alfo will make a very probable guefs at what quantity the mine is likely to yield of it in proportion to the ore.

SHOAL, in the fea language, denotes a place where the water is fhallow; and likewife a great quantity of fifhes, fuch as a *fhoal of herrings*.

SHOCK, in *Electricity*. The effect of the explofion of a charged body, that is, the difcharge of its electricity on any other body, is called the *electric fhock*.

SHOE, a covering for the foot, ufually of leather.

SHOES, among the Jews, were made of leather, linen, rufh, or wood; thofe of foldiers were fometimes of brafs or iron. They were tied with thongs which paffed under the foles of the feet. To put off their fhoes was an act of veneration; it was alfo a fign of mourning and humiliation: to bear one's fhoes, or to untie the latchets of them, was confidered as the meaneft fervice.

Among the Greeks fhoes of various kinds were ufed. Sandals were worn by women of diftinction. The Lacedemonians wore red fhoes. The Grecian fhoes generally reached to the middle of the leg. The Romans ufed two kinds of fhoes; the *calceus*, which covered the whole foot fomewhat like our fhoes, and was tied above with latchets or ftrings; and the *folea* or flipper, which covered only the fole of the foot, and was faftened with leathern thongs. The calceus was always worn along with the *toga* when a perfon went abroad: flippers were put on during a journey and at feafts, but it was reckoned effeminate to appear in public with them. Black fhoes were worn by the citizens of ordinary rank, and white ones by the women. Red fhoes were fometimes worn by the ladies, and purple ones by the coxcombs of the other fex. Red fhoes were put on by the chief magiftrates of Rome on days of ceremony and triumphs. The fhoes of fenators, patricians, and their children, had a crefcent upon them which ferved for a buckle; thefe were called *calcei lunati*. Slaves wore no fhoes; hence they were called *cretati* from their dufty feet. Phocion alfo and Cato Uticenfis went without fhoes. The toes of the Roman fhoes were turned up in the point; hence they were called *calcei roftrati, repandi*, &c.

In the 9th and 10th centuries the greateft princes of Europe wore wooden fhoes, or the upper part of leather and the fole of wood. In the reign of William Rufus, a great beau, Robert, furnamed *the horned*, ufed fhoes with long fharp points, ftuffed with tow, and twifted like a ram's horn. It is faid the clergy, being highly offended, declaimed againft the long-pointed fhoes with great vehemence. The points, however, continued to increafe till, in the reign of Richard II. they were of fo enormous a length that they were tied to the knees with chains, fometimes of gold, fometimes of filver. The upper parts of thefe fhoes in Chaucer's time were cut in imitation of a church window. The long-pointed fhoes were called *crackowes*, and continued in fafhion for three centuries in fpite of the bulls of popes, the decrees of councils, and the declamations of the clergy. At length the parliament of England interpofed by an act A. D. 1463, prohibiting the ufe of fhoes or boots with pikes exceeding two inches in length, and prohibiting all fhoemakers from making fhoes or boots with longer pikes under fevere penalties. But even this was not fufficient: it was neceffary to denounce the dreadful fentence of excommunication againft all who wore fhoes or boots with points longer than two inches. The prefent fafhion of fhoes was introduced in 1633, but the buckle was not ufed till 1670.

In Norway they ufe fhoes of a particular conftruction, confifting of two pieces, and without heels; in which the upper leather fits clofe to the foot, the fole being joined to it by many plaits or folds.

The fhoes or flippers of the Japanefe, as we are informed by Profeffor Thunberg, are made of rice-ftraw woven, but fometimes for people of diftinction of fine flips of ratan. The fhoe confifts of a fole, without upper leather or hind-piece; forwards it is croffed by a ftrap, of the thicknefs of one's finger, which is lined with linen; from the tip of the fhoe to the ftrap a cylindrical ftring is carried, which paffes between the great and fecond toe, and keeps the fhoe faft on the foot. As thefe fhoes have no hind-piece, they make a noife when people walk in them like flippers. When the Japanefe travel, their fhoes are furnifhed with three ftrings made of twifted ftraw, with which they are tied to the legs and feet, to prevent them from falling off. Some people carry one or more pairs of fhoes with them on their journeys, in order to put on new, when the old ones are worn out. When it rains, or the roads are very dirty, thefe fhoes are foon wetted through, and one continually fees a great number of worn-out fhoes lying on the roads, efpecially near the brooks, where travellers have changed their fhoes after wafhing their feet. Inftead of thefe, in rainy or dirty weather they wear high wooden clogs, which underneath are hollowed out in the middle, and at top have a band acrofs like a ftirrup, and a ftring for the great toe; fo that they can walk without foiling their feet. Some of them have their ftraw fhoes faftened to thefe wooden clogs. The Japanefe never enter their houfes with their fhoes on; but leave them in the entry, or place them on the bench near the door, and thus are always barefooted in their houfes, fo as not to dirty their neat mats. During the time that the Dutch live at Japan, when they are fometimes under an obligation of paying vifits at the houfes of the Japanefe, their own rooms at the factory being likewife covered with mats of this kind, they wear, inftead of the ufual fhoes, red, green, or black flippers, which, on entering the houfe they pull off: however, they have ftockings on, and fhoes made of cotton ftuff with buckles in them, which fhoes are made at Japan, and can be wafhed whenever they are dirty. Some have them of black fatin, in order to avoid wafhing them.

SHOE of an Anchor, a fmall block of wood, convex on the back, and having a fmall hole, fufficient to contain the point of the anchor fluke, on the forefide. It is ufed to prevent the anchor from tearing or wounding the planks on the fhip's bow, when afcending or defcending; for which purpofe the fhoe flides up and down along the bow between the fluke of the anchor and the planks, as being preffed clofe to the latter by the weight of the former.

To SHOE an Anchor, is to cover the flukes with a broad

Shoemakers

broad triangular piece of plank, whose area or superficies is much larger than that of the flukes. It is intended to give the anchor a stronger and surer hold of the bottom in very soft and oozy ground.

SHOEMAKERS MACHINE for working at in a standing posture. A machine for this purpose was invented by Mr Thomas Parker, who, on the 22d of November, 1804, attended a committee appointed by the Society of Arts, and informed them that he had made use of this apparatus for twelve months, and found it very useful. He observed that all the work of shoe-making may be done with it standing; but that in some parts thereof he found an advantage in using along with it a high stool; and that prior to the use of this machine, he never saw or heard of a similar invention; and that he found it of great service to his health.

He estimated the cost of such a machine at two guineas.

Plate CCCCXCVI. Fig. 1.

Plate CCCCXCVI. fig. 1. T, a bench standing on four legs, about four feet from the ground.

V, A circular cushion affixed to the bench, in the centre of which cushion is an open space quite through the bench, through which hole a leather strap U is brought up from below. This strap holds the work and last firm upon the cushion in any position required, by means of the workman's foot placed upon the treadle W.

X, Shews the last upon the cushion, with the strap holding it firm.

Y, An implement used in closing boots.

Z, A small flat leather cushion, useful in adjusting the last and strap.

L, The shoe-last shewn separate from the cushion. The round cushion is formed of a circular piece of wood, covered with leather or stuffed with wool or hair to give it some elasticity.

Another machine for the same purpose has been invented by Mr Holden of Fettleworth in Suffex, and the following account of it was presented to the Society of Arts. He observes that the sitting posture had so greatly injured his health, as to render it necessary to give up his business, and in this difficulty he invented the machine which he found to answer the purpose fully, as it enabled him to resume his work with the recovery of his health. He recommends it as the quickest way of closing all the thread work, and he adds, that he has made 1800 or 2000 pairs of shoes with the machine, and still continues to employ it. The following is a description of the machine.

Fig. 2.

Fig. 2. A, The bed for the closing block, and to lay the shoe in, whilst sewing.

B, The closing block.

C, A loose bed to lay the shoe in whilst stitching; the lower part of which is here exhibited reversed, to shew how it is placed in the other bed A.

D, The hollow or upper part of the loose bed C, in which the shoe is laid while stitching.

E, A table on which the tools wanted are to be laid.

F, An iron semi-circle, fixed to each end of the bed A, to allow the bed to be raised or depressed. This half circle moves in the block G.

H, Another iron semi-circle, with notches, which catch upon a tooth in the centre of the block, to hold the bed in any angle required. This semi-circle moves sidewise on two hooks in staples at each end of the bed.

I, The tail or stem of the bed A, moving in a cylindrical hole in the pillar, enabling the bed to be turned in any required direction, and which, with the movement F, enables the operator to place the shoe in any position necessary.

Shoemakers || Shooting.

K, The pillar, formed like the pillar of a clawtable, excepting the two side legs being in a direct line, and the other leg at a right angle with them.

L, The semi-circle H, shewn separately, to explain how it is connected with the staples, and how the notches are formed.

M, The tail or stem of the bed A, and the lower part of the bed N, shewn separately, to explain how the upper part of the bed is raised or depressed occasionally.

Horse-SHOE. See FARRIERY, N° 131.

SHOOTING, in the military art. See ARTILLERY, GUNNERY, and PROJECTILES.

1 Shooting in sportmanship.

SHOOTING, in sportmanship, the killing of game by the gun, with or without the help of dogs.

Under this article we shall lay down all the rules which are necessary to be observed in order to render one accomplished and successful in the art of shooting.

2 Directions for choosing a fowling-piece.

The first thing which the sportsman ought to attend to is the choice of his fowling-piece. Conveniency requires that the barrel be as light as possible, at the same time it ought to possess that degree of strength which will make it not liable to burst. Experience has proved, that a thin and light barrel, which is of equal thickness in every part of its circumference, is much less liable to burst than one which is considerably thicker and heavier, but which, from being badly filed or bored, is of unequal strength in different places.

It is also of importance to determine of what length the barrel ought to be, in order to acquire that range which the sportsman has occasion for. On this subject we have received the following information from an experienced sportsman. We have, at different times, compared barrels of all the intermediate lengths between 28 and 40 inches, and of nearly the same caliber, that is to say, from 22 to 26; and these trials were made both by firing the pieces from the shoulder, and from a firm block, at an equal distance, and with equal weights of the same powder and of the same shot.

To avoid every possibility of error, the quires of paper at which we fired were fixed against planks instead of being placed against the wall. From these trials frequently repeated, we found that the shot pierced an equal number of sheets, whether it was fired from a barrel of 28, 30, 32, 34, 36, 38, or 40, inches in length. Nay more, we have compared two barrels of the same caliber, but one of them 33, and the other 66 inches long, by repeatedly firing them in the same manner as the others, at different distances, from 45 to 100 paces, and the results have always been the same, i. e. the barrel of 33 inches drove its shot through as many sheets of paper as that of 66 did. The conclusion from all this is, that the difference of 10 inches in the length of the barrel, which seems to be more than is ever insisted upon among sportsmen, produces no sensible difference in the range of the piece; and therefore, that every one may please himself in the length of his barrel, without either detriment or advantage to the range.

It may appear as an objection to this, that a duck-gun which is five or six feet long kills at a greater distance than

Shoemakers MACHINE.

Plate CCCCXCVI.

Fig. 1.

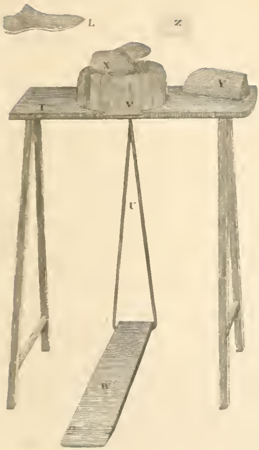

Fig. 2.

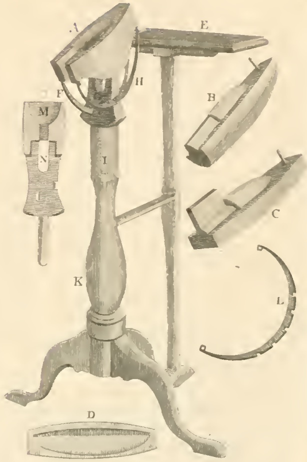
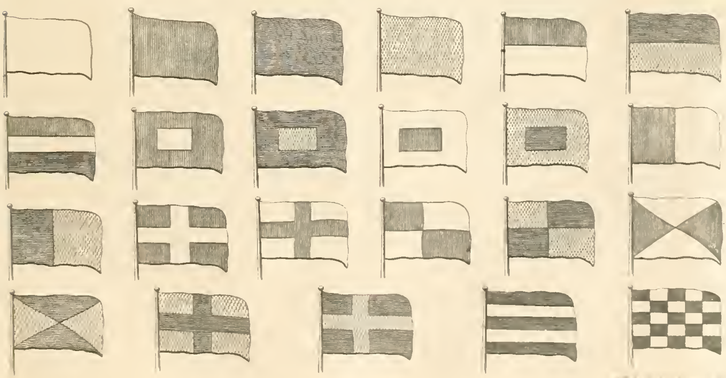


Naval SIGNALS.



Shooting.

than a fowling-piece ; but this is not owing to its length, but to its greater weight and thickneſs, which give it ſuch additional ſtrength, that the ſhot may be increaſed, and the charge of powder doubled, trebled, and even

3 **Proper length of the barrel**

quadrupled. But a barrel of five or ſix feet length would be very inconvenient for fowling. Thoſe who conſult the appearance of the piece, lightneſs, and the eaſe with which it is managed, will find that a barrel from 32 to 38 inches will anſwer beſt.

4 **Caliber.**

The next thing to be conſidered is, of what dimenſions the caliber or bore of a fowling-piece ought to be. This matter has been ſubjected to experiment, and it has been found, that a barrel of 22 or 24, which is the largeſt caliber uſually employed in fowling-pieces, throws its ſhot as cloſely as one of the ſmalleſt caliber, viz. of 30 or 32 (A).

5 **Length and form of the ſtock.**

As to the length and form of the ſtock, it may be laid down as a principle, that a long ſtock is preferable to a ſhort one, and at the ſame time rather more bent than uſual ; for a long ſtock fits firmer to the ſhoulder than a ſhort one, and particularly ſo when the ſhooter is accuſtomed to place his left hand, which principally ſupports the piece, near to the entrance of the ramrod into the ſtock.

It is certain, however, that the ſtock may be ſo formed as to be better ſuited to one man than another. For a tall, long-armed man, the ſtock of a gun ſhould be longer than for one of a leſs ſtature and ſhorter arm. That a ſtraight ſtock is proper for him who has high ſhoulders and a ſhort neck ; for, if it be much bent, it would be very difficult for him, eſpecially in the quick motion required in ſhooting at a flying or running object, to place the butt of the gun-ſtock firmly to the ſhoulder, the upper part alone would in general be fixed ; which would not only raiſe the muzzle, and conſequently ſhoot high, but make the recoil much more ſenſibly felt, than if the whole end of the ſtock were firmly placed on his ſhoulder. Beſides, ſuppoſing the ſhooter to bring the butt home to his ſhoulder, he would ſcarcely be able to level his piece at the object. On the contrary, a man with low ſhoulders, and a long neck, requires a ſtock much bent ; for if it is ſtraight, he will, in the act of lowering his head to that place of the ſtock at which his cheek ſhould reſt in taking aim, feel a conſtraint which he never experiences, when by the effect of the proper degree of bent, the ſtock lends him ſome aſſiſtance, and, as it were, meets his aim half way.

Having now deſcribed the fowling-piece which has been found to anſwer beſt, it will next be proper to give ſome inſtructions for the choice of gunpowder, ſhot, and wadding.

6 **Beſt gunpowder.**

The various kinds of gunpowder are well known ; but, in the opinion of ſome experienced ſportſmen, Hervey's battle-powder is the beſt. Thoſe who wiſh to examine the ſtrength of powder, may determine it by drying ſome of it very well, and then trying how many ſheets of paper it will drive the ſhot through, at the diſtance of 10 or 12 yards. In this trial we ſhould be careful to employ the ſame ſized ſhot in each experiment, the quantity both of the ſhot and the powder being regulated by exact weight ; otherwiſe we cannot, even in this experiment, arrive at any certainty in comparing the ſtrength of different powders, or of the ſame powder at different times.

7 **To be kept dry.**

Powder ought to be kept very dry, for every degree of moiſture injures it ; and if conſiderable, the ſaltpetre is diſſolved, and the intimate combination of the ſeveral ingredients is entirely deſtroyed. It is obſerved, that after firing with damp powder the piece becomes very foul, which ſeems to ariſe from the diminution of the activity of the fire in the exploſion. Flaſks of copper or tin are much better for keeping powder in than thoſe made of leather, or than ſmall caſks. Their necks ought to be ſmall and well ſtopped with cork.

8 **Size of ſhot.**

The *patent milled ſhot* is now very generally uſed, and is reckoned ſuperior to any other. The ſize of the ſhot muſt vary according to the particular ſpecies of game which is the object of the ſportſman's purſuit, as well as be adapted to the ſeaſon. In the firſt month of partridge ſhooting, N° 1. is moſt proper ; for ſince at this time the birds ſpring near at hand, and we ſeldom fire at more than the diſtance of 40 paces, if the ſhooter takes his aim but tolerably well, it is almoſt impoſſible for a bird at this diſtance to eſcape in the circle which the ſhot forms.

As hares ſit cloſer, and are thinly covered with fur at this ſeaſon, they may eaſily be killed with this ſhot at 30 or 35 paces. N° 1. is equally proper for ſhooting ſnipes or quails. About the beginning of October, when the partridges are ſtronger, N° 3. is the moſt proper ſhot to be uſed. Many ſportſmen uſe no other during the whole ſeaſon. The directions which have now been given refer only to the patent ſhot.

We ſhall now ſubjoin a table, which will ſhew at one view the number of pellets compoſing an ounce weight of each ſort of ſhot, the patent and the common, beginning with the ſmalleſt ſize.

PATENT SHOT.

3	id.	140
2	id.	110
1	id.	95

9 **Proportion of powder and ſhot in the charge.**

For a fowling-piece of a common caliber, which is from 24 to 30 balls to the pound weight, a dram and a quarter,

(A) In ſpeaking of the ſize of the caliber, we mean by 22 or 24, that ſo many balls exactly fitting it weigh juſt one pound ; and every caliber is marked in the ſame way.

(B) The reader will obſerve that the patent ſhot has no N° 6, the × being ſubſtituted in its place, and that the numbers do not follow each other in the order of progreſſion : The reaſon of this we cannot aſſign.

Shooting. quarter, or at moſt a dram and a half, of good powder; and an ounce, or an ounce and a quarter of ſhot, is ſufficient. But when ſhot of a larger ſize is uſed, ſuch as N° 5. the charge of ſhot may be increaſed one-fourth, for the purpoſe of counterbalancing in ſome degree what the ſize of the ſhot loſes in the number of pellets, and alſo to enable it to garniſh the more. For this purpoſe the ſportſman will find a meaſure marked with the proper gauges very convenient to him. An inſtrument of this nature has been made by an ingenious artiſt of London, Egg, of the Haymarket.

A conſequence of overloading with ſhot, is the powder has not ſufficient ſtrength to throw it to its proper diſtance; for if the object fired at be diſtant, one-half of the pellets compoſing the charge, by their too great quantity and weight, will ſtrike againſt each other, and fall by the way; and thoſe which reach the mark will have ſmall force, and will produce but little or no effect.

10 Wadding. The uſe of the *wadding* is to carry the ſhot in a body to a certain diſtance from the muzzle of the piece. It ought to be of ſoft and pliable materials. The beſt kind of wadding, in the opinion of an experienced fowler, is a piece of an old hat; but this cannot be obtained in ſufficient quantity. Next to it nothing is better than ſoft brown paper, which combines ſuppleneſs with conſiſtence, moulds itſelf to the barrel, and never falls to the ground within 12 or 15 paces from the muzzle of the piece. Tow anſwers very well, and cork has been extolled for poſſeſſing the peculiar virtue of increaſing the range and cloſeneſs of the ſhot.

The wadding ought to be quite cloſe in the barrel, but not rammed too hard; for if it be rammed too cloſe, or be of a rigid ſubſtance, the piece will recoil, and the ſhot will ſpread too much. On the other hand, if the wadding be very looſe, or is compoſed of too ſoft materials, ſuch as wool or cotton, the diſcharge will not poſſeſs proper force.

11 Powder and ſhot to be ſlightly rammed down. In loading a piece, the powder ought to be ſlightly rammed down by only preſſing the ramrod two or three times on the wadding, and not by drawing up the ramrod and then returning it into the barrel with a jerk of the arm ſeveral times. For when the powder is violently compreſſed, ſome of the grains muſt be bruiſed, which will prevent the exploſion from being quick, and will ſpread the ſhot too wide. In pouring the powder into the barrel, the meaſure ought to be held ſo as that the powder may fall moſt readily to the bottom. That no grains may adhere to the ſides of the barrel, the butt-end of the piece may be ſtruck againſt the ground. The ſhot ought never to be rammed down with force: it is ſufficient to ſtrike the butt-end of the gun againſt the ground as before. Then the wadding is to be put down gently. A ſportſman ought never to carry his gun under his arm with the muzzle inclined downwards, for this practice looſens the wadding and charge too much.

12 Directions for loading and firing. Immediately after the piece is fired it ought to be reloaded; for while the barrel is ſtill warm, there is no danger of any moiſture lodging in it to hinder the powder from falling to the bottom. As it is found that the coldneſs of the barrel, and perhaps the moiſture condenſed in it, diminiſhes the force of the powder in the firſt ſhot; it is proper to fire off a little powder before the piece is loaded. Some prime before loading, but this is not proper unleſs the touch-hole be very large. After every diſcharge the touch-hole ought to be pricked, or a ſmall feather may be inſerted to clear away any humidity or foulneſs that has been contracted.

The ſportſman having loaded his piece, muſt next prepare to fire. For this purpoſe he ought to place his hand near the entrance of the ramrod, and at the ſame time graſp the barrel firmly. The muzzle ſhould be a little elevated, for it is more uſual to ſhoot low than high. This direction ought particularly to be attended to when the object is a little diſtant; becauſe ſhot as well as ball only moves a certain diſtance point blank, when it begins to deſcribe the curve of the parabola.

13 Diſtance at which the ſportſman ought to kill. Practice ſoon teaches the ſportſman the proper diſtance at which he ſhould ſhoot. The diſtance at which he ought infallibly to kill any kind of game with patent ſhot, N° 3. provided the aim be well taken, is from 25 to 35 paces for the footed, and from 40 to 45 paces for the winged, game. Beyond this diſtance even to 50 or 55 paces, both partridges and hares are ſometimes killed; but in general the hares are only ſlightly wounded, and carry away the ſhot; and the partridges at that diſtance preſent ſo ſmall a ſurface, that they frequently eſcape untouched between the ſpaces of the circle. Yet it does not follow that a partridge may not be killed with N° 3. patent ſhot at 60 and even 70 paces diſtance, but then theſe ſhots are very rare.

14 How the aim is to be taken. In ſhooting at a bird flying, or a hare running acroſs, it is neceſſary to take aim before the object in proportion to its diſtance at the time of firing. If a partridge flies acroſs at the diſtance of 30 or 35 paces, it will be ſufficient to aim at the head, or at moſt but a ſmall ſpace before it. If it be 50, 60, or 70 paces diſtant, it is then requiſite to aim at leaſt half a foot before the head. The ſame practice ought to be obſerved in ſhooting at a hare, rabbit, or fox, when running in a croſs direction; at the ſame time making due allowance for the diſtance and ſwiftneſs of the pace. Another thing to be attended to is, that the ſhooter ought not involuntarily to ſtop the motion of the arms at the moment of pulling the trigger; for the inſtant the hand ſtops in order to fire, however inconſiderable the time be, the bird gets beyond the line of aim, and the ſhot will miſs it. A ſportſman ought therefore to accuſtom his hand while he is taking aim to follow the object. When a hare runs in a ſtraight line from the ſhooter, he ſhould take his aim between the ears, otherwiſe he will run the hazard either of miſſing, or at leaſt not of killing dead, or as it is ſometimes called *clean*.

15 Every part of the piece to be kept clean and dry. A fowling-piece ſhould not be fired more than 20 or 25 times without being waſhed; a barrel when foul neither ſhoots ſo ready, nor carries the ſhot ſo far as when clean. The flint, pan, and hammer, ſhould be well wiped after each ſhot; this contributes greatly to make the piece go off quick, but then it ſhould be done with ſuch expedition, that the barrel may be reloaded whilſt warm, for the reaſons we have before advanced. The flint ſhould be frequently changed, without waiting until it miſſes fire, before a new one is put in. Fifteen or eighteen ſhots, therefore, ſhould only be fired with the ſame flint; the expence is too trifling to be regarded, and by changing it thus often much vexation will be prevented.

A gun alſo ſhould never be fired with the prime of the preceding day; it may happen that an old priming will ſometimes go off well, but it will more frequently contract moiſture and ſuze in the firing; then the object will moſt probably be miſſed, and that becauſe the piece was not freſh primed.

16 When and how game is to be ſought for.

For the information of the young ſportſman we ſhall add a few more general directions. In warm weather he ought to ſeek for game in plains and open grounds, and in cold weather he may ſearch little hills expoſed to the ſun, along hedges, among heath, in ſtubbles, and in paſtures where there is much furze and fern. The morning is the beſt time of the day, before the dew is exhaled, and before the game has been diſturbed. The colour of the ſhooters dreſs ought to be the ſame with that of the fields and trees; in ſummer it ought to be green, in winter a dark gray. He ought to hunt as much as poſſible with the wind, not only to prevent the game from perceiving the approach of him and his dog, but alſo to enable the dog to ſcent the game at a greater diſtance.

He ſhould never be diſcouraged from hunting and ranging the ſame ground over and over again, eſpecially in places covered with heath, brambles, high graſs, or young coppice wood. A hare or rabbit will frequently ſuffer him to paſs ſeveral times within a few yards of its form without getting up. He ſhould be ſtill more patient when he has marked partridges into ſuch places, for it often happens, that after the birds have been ſprung many times, they lie ſo dead that they will ſuffer him almoſt to tread upon them before they will riſe. Pheaſants, quails, and woodcocks do the ſame.

He ought to look carefully about him, never paſſing a buſh or tuft of graſs without examination; but he ought never to ſtrike them with the muzzle of his gun for it will looſen his wadding. He who patiently beats and ranges his ground over again, without being diſcouraged, will always kill the greateſt quantity of game; and if he is ſhooting in company, he will find game where others have paſſed without diſcovering any.

When he has fired he ſhould call in his dog, that he may not have the mortification to ſee game riſe which he cannot ſhoot. When he has killed a bird, inſtead of being anxious about picking it up, he ought to follow the reſt of the covey with his eye till he ſee them ſettle.

17 Dogs fit for ſport.

Three ſpecies of dogs are capable of receiving the proper inſtruction, and of being trained. Theſe are the ſmooth pointer, the ſpaniel, and the rough pointer. The laſt is a dog with long curled hair, and ſeems to be a mixed breed of the water-dog and the ſpaniel. The ſmooth pointer is active and lively enough in his range, but in general is proper only for an open country.

The greateſt part of theſe dogs are afraid of water, brambles, and thickets; but the ſpaniel and the rough pointer are eaſily taught to take the water, even in cold weather, and to range the woods and rough places as well as the plain. Greater dependence may therefore be had on theſe two laſt ſpecies of dogs than on the ſmooth pointer.

18 Directions for training a pointer.

The education of a pointer may commence when he is only five or ſix months old. The only leſſons which he can be taught at this time are to *fetch* and *carry* any thing when deſired; to come in when he runs far off, and to go behind when he returns; uſing, in the one caſe, the words *here*, *come in*, and in the other *back* or *behind*. It is alſo neceſſary at this period to accuſtom him to be tied up in the kennel or ſtable; but he ought not at firſt to be tied too long. He ſhould be let looſe in the morning, and faſtened again in the evening. When a dog is not early accuſtomed to be chained, he diſturbs every perſon in the neighbourhood by howling. It is alſo of importance that the perſon who is to train him ſhould give him his food.

When the dog has attained the age of 10 or 12 months, he may be carried into the field to be regularly trained. At firſt he may be allowed to follow his own inclination, and to run after every animal he ſees. His indiſcriminating eagerneſs will ſoon abate, and he will purſue only partridges and hares. He will ſoon become tired of following partridges in vain, and will content himſelf after having fluſhed them to follow them with his eyes. It will be more difficult to prevent him from following hares.

All young dogs are apt to *rake*; that is, to hunt with their noſes cloſe to the ground, to follow birds rather by the track than by the wind. But partridges lie much better to dogs that *wind* them, than to thoſe that follow them by the track. The dog that winds the ſcent approaches the birds by degrees and without diſturbing them; but they are immediately alarmed when they ſee a dog tracing their footſteps. When you perceive that your dog is committing this fault, call to him in an angry tone *hold up*: he will then grow uneaſy and agitated, going firſt to the one ſide and then to the other, until the wind brings him the ſcent of the birds After finding the *game* four or five times in this way, he will take the wind of himſelf, and hunt with his noſe high. If it be difficult to correct this fault, it will be neceſſary to put the *puzzle peg* upon him. This is of very ſimple conſtruction, conſiſting only of a piece of oak or deal inch board, one foot in length, and an inch and a half in breadth, tapering a little to one end; at the broader end are two holes running longitudinally, through which the collar of the dog is put, and the whole is buckled round his neck; the piece of wood being projected beyond his noſe, is then faſtened with a piece of leather thong to his under jaw. By this means the peg advancing ſeven or eight inches beyond his ſnout, the dog is prevented from putting his noſe to the ground and raking.

As ſoon as the young dog knows his game, you muſt bring him under complete ſubjection. If he is tractable, this will be eaſy; but if he is ſtubborn, it will be neceſſary to uſe the *traſh cord*, which is a rope or cord of 20 or 25 fathoms in length faſtened to his collar. If he refuſe to come back when called upon, you muſt check him ſmartly with the cord, which will often bring him upon his haunches. But be ſure you never call to him except when you are within reach of the cord. After repeating this ſeveral times he will not fail to come back when called; he ought then to be careſſed, and a bit of bread ſhould be given him. He ought now conſtantly to be tied up, and never unchained, except when you give him his food, and even then only when he has done ſomething to deſerve it.

The next ſtep will be to throw down a piece of bread on the ground, at the ſame moment taking hold of

Shooting. of the dog by the collar, calling out to him, "take heed,—foftly." After having held him in this manner for fome fpace of time, fay to him, "feize—lay hold." If he is impatient to lay hold of the piece of bread before the fignal is given, correct him gently with a fmall whip. Repeat this leffon until he "takes heed" well, and no longer requires to be held faft to prevent him from laying hold of the bread. When he is well accuftomed to this manége, turn the bread with a ftick, holding it in the manner you do a fowling-piece, and having done fo, cry *feize*. Never fuffer the dog to eat either in the houfe or field without having firft made him take heed in this manner.

Then, in order to apply this leffon to the game, fry fmall pieces of bread in hogs lard, with the dung of partridge; take thefe in a linen bag into the fields, ftubbles, ploughed grounds, and paftures, and there put the pieces in feveral different places, marking the fpots with little cleft pickets of wood, which will be rendered more diftinguifhable by putting pieces of card in the nicks. This being done, caft off the dog and conduct him to thefe places, always hunting in the wind. After he has caught the fcent of the bread, if he approaches too near, and feems eager to fall upon it, cry to him in a menacing tone, "take heed;" and if he does not ftop immediately, correct him with the whip. He will foon comprehend what is required of him, and will ftand.

At the next leffon, take your gun charged only with powder, walk gently round the piece of bread once or twice, and fire inftead of crying *feize*. The next time of practifing this leffon, walk round the bread four or five times, but in a greater circle than before, and continue to do this, until the dog is conquered of his impatience, and will ftand without moving until the fignal is given him. When he keeps his point well, and ftands fteady in this leffon, you may carry him to the birds; if he run in upon them, or bark when they fpring up, you muft correct him; and if he continue to do fo, you muft return to the fried bread; but this is feldom neceffary.

When the dog has learned by this ufe of the bread to take heed, he may be carried to the fields with the trafh-cord dragging on the ground. When he fprings birds for the firft time, if he runs after them or barks, check him by calling out to him, *take heed*. If he point properly, carefs him; but you ought never to hunt without the cord until he point ftaunch.

19 and preventing his running after fheep.

If the dog runs after fheep, and it be difficult to cure him, couple him with a ram, and then whip the dog as long as you can follow him. His cries will at firft alarm the ram; he will run with all his fpeed, and drag the dog along with him; but he will at length take courage, turn upon the dog, and butt him feverely with his horns. When you think the dog is fufficiently chaftifed, untie him: he will never run at fheep again.

Having now given a few general inftructions concerning the beft method of training pointers, we fhall fubjoin a few obfervations refpecting the moft common fpecies of game, the partridge, pheafant, groufe, woodcock, fnipe, and wild duck.

20 Obfervations concerning the partridge.

Partridges pair in the fpring, and lay their eggs (generally from 15 to 20) during May and part of June. The young begin to fly about the end of June, and their plumage is complete in the beginning of October. The male has a confpicuous horfe fhoe upon his breaft, an obtufe fpur on the hinder part of the leg, which diftinguifh him from the female. He is alfo rather larger.

When a fportfman is fhooting in a country where the birds are thin, and he no longer choofes to range the field for the bare chance of meeting with them, the following method will fhow him where to find them on another day. In the evening, from funfet to nightfall, he fhould poft himfelf in a field, at the foot of a tree or a bufh, and there wait until the partridges begin to call or juck, which they always do at that time; not only for the purpofe of drawing together when feparated, but alfo when the birds compofing the covey are not difperfed. After calling in this manner for fome little fpace of time, the partridges will take to flight; then, if he mark the place where they alight, he may be affured they will lie there the whole night, unlefs difturbed. Let him return to the fame poft the next morning by break of day, and there watch a while; being careful to keep his dog in a ftring, if he is not under perfect command.

As foon as the dawn begins to peep, the partridges will begin to call, and foon afterwards will perform the fame manœuvre as on the preceding evening; that is, after having called a while, they will take their flight, and will moft commonly fettle at a little diftance. There in a few minutes they will call again, and fometimes take a fecond flight, but that will be to no great diftance. Then as foon as the fun is rifen, and the fportfman can fee to fhoot, he may caft off his dog and purfue them.

21 Pheafant.

The *pheafant* is of the fize of a common dunghill cock, and lays its eggs generally in the woods, the number of which is 10 or 12.

Pheafants are accounted ftupid birds; for when they are furprifed they will frequently fquat down like a rabbit, fuppofing themfelves to be in fafety as foon as their heads are concealed; and in this way they will fometimes fuffer themfelves to be killed with a ftick. They love low and moift places, and haunt the edges of thofe pools which are in found in woods, as well as the high grafs of marfhes that are near at hand; and above all, places where there are clumps of alders.

22 Groufe.

Groufe, or moor-game, are found in Wales, in the northern counties of England, and in great abundance in Scotland. They chiefly inhabit thofe mountains and moors which are covered with heath, and feldom defcend to the low grounds. They fly in companies of four or five braces, and love to frequent moffy places, particularly in the middle of the day or when the weather is warm. In purfuing this game, when the pointer fets, and the fportfman perceives the birds running with their heads erect, he muft run after them as faft as he can, in the hope that he may get near enough to fhoot when they rife upon the wing; for he may be pretty certain they will not lie well that day. As thefe birds are apt to grow foon putrid, they ought to be drawn carefully the inftant they are fhot and ftuffed with any heath, and if the feathers happen to be wetted they muft be wiped dry.

23 Woodcock.

The *woodcock* is a bird of paffage; it commonly arrives about the end of October, and remains until the middle of March. Woodcocks are fatteft in December and January, but from the end of February they are lean. At their arrival they drop anywhere, but afterwards

wards take up their reſidence in copſes of nine or ten years growth. They ſeldom, however, ſtay in one place longer than 12 or 15 days. During the day, they remain in thoſe parts of the woods where there are void ſpaces or glades, picking up earth-worms and grubs from the fallen leaves. In the evening they go to drink and waſh their bills at pools and ſprings, after which they repair to the open fields and meadows for the night. It is remarkable, that when a woodcock ſprings from a wood to go into the open country, he always endeavours to find ſome glade or opening, which he follows to the boundaries of the wood. At his return he purſues the ſame path a good way, and then turns to the right or left oppoſite to ſome glade, in order to drop into a thick part of the wood, where he may be ſheltered from the wind. He may therefore be watched with advantage in theſe narrow paſſes and little alleys on the edges of woods which lead to a pool or ſpring, or he may be watched in the duſk of the evening near the pools which he frequents.

24 Snipe. The *ſnipe* is a bird of paſſage as well as the woodcock. This bird is ſcarcely worth ſhooting till the froſt commences. In the month of November they begin to grow fat. Snipes, like woodcocks, frequent ſprings, bogs, and marſhy places, and generally fly againſt the wind. The ſlant and croſs ſhots are rather difficult, as the birds are ſmall and fly very quickly. The ſportſman ought to look for them in the direction of the wind; becauſe then they will fly towards him, and preſent a fairer mark.

25 Wild duck. The *wild duck* is alſo a bird of paſſage, and arrives here in great flocks from the northern countries in the beginning of winter. Still, however, a great many remain in our marſhes and fens during the whole year, and breed.

The wild duck differs little in plumage from the tame duck, but is eaſily diſtinguiſhed by its ſize, which is leſs; by the neck, which is more ſlender; by the foot, which is ſmaller; by the nails, which are more black; and above all, by the web of the foot, which is much finer and ſofter to the touch.

In the ſummer ſeaſon, when it is known that a team of young ducks are in a particular piece of water, and juſt beginning to fly, the ſportſman is ſure to find them early in the morning dabbling at the edges of the pool, and amongſt the long graſs, and then he may get very near to them: it is uſual alſo to find them in thoſe places at noon.

In the beginning of autumn almoſt every pool is frequented by teams of wild ducks, which remain there during the day, concealed in the ruſhes. If theſe pools are of ſmall extent, two ſhooters, by going one on each ſide, making a noiſe and throwing ſtones into the ruſhes, will make them fly up; and they will in this way frequently get ſhots, eſpecially if the pool is not broad, and contracts at one end. But the ſureſt and moſt ſucceſsful way, is to launch a ſmall boat or trow on the pool, and to traverſe the ruſhes by the openings which are found; at the ſame time making as little noiſe as poſſible. In this manner the ducks will ſuffer the ſportſmen to come ſufficiently near them to ſhoot flying; and it often happens that the ducks, after having flown up, only make a circuit, return in a little time, and again alight upon the pool. Then the ſportſmen endeavour a ſecond time to come near them. If ſeveral ſhooters are in company, they ſhould divide; two ſhould go in the boat, whilſt the others ſpread themſelves about the edge of the pool, in order to ſhoot the ducks in their flight. In pools which will not admit a trow, water-ſpaniels are abſolutely neceſſary for this ſport.

In winter they may be found on the margins of little pools; and when pools and rivers are frozen up, they muſt be watched for in places where there are ſprings and waters which do not freeze. The ſport is then much more certain, becauſe the ducks are confined to theſe places in order to procure aquatic herbs, which are almoſt their only food at this period.

SHOP-LIFTERS, are thoſe that ſteal goods privately out of ſhops; which, being to the value of 5s. though no perſon be in the ſhop, is felony without the benefit of clergy by the 10 and 11 W. III. c. 23.

SHORE, a place waſhed by the ſea, or by ſome large river.

Count Marſigli divides the ſea-ſhore into three portions: the firſt of which is that tract of land which the ſea juſt reaches in ſtorms and high tides, but which it never covers; the ſecond part of the ſhore is that which is covered in high tides and ſtorms, but is dry at other times; and the third is the deſcent from this, which is always covered with water.

The firſt part is only a continuation of the continent, and ſuffers no alteration from the neighbourhood of the ſea, except that it is rendered fit for the growth of ſome plants, and wholly unfit for that of others, by the ſaline ſteams and impregnations: and it is ſcarce to be conceived by any, but thoſe who have obſerved it, how far on land the effects of the ſea reach, ſo as to make the earth proper for plants which will not grow without this influence; there being ſeveral plants frequently found on high hills and dry places, at three, four, and more miles from the ſea, which yet would not grow unleſs in the neighbourhood of it, nor will ever be found elſewhere.

The ſecond part or portion of the ſhore is much more affected by the ſea than the former, being frequently waſhed and beaten by it. Its productions are rendered ſalt by the water, and it is covered with ſand, or with the fragments of ſhells in form of ſand, and in ſome places with a tartarous matter depoſited from the water; the colour of this whole extent of ground is uſually duſky and dull, eſpecially where there are rocks and ſtones, and theſe covered with a ſlimy matter.

The third part of the ſhore is more affected by the ſea than either of the others; and is covered with an uniform cruſt of the true nature of the bottom of the ſea, except that plants and animals have their reſidence in it, and the decayed parts of theſe alter it a little.

SHORE, *Jane*, the celebrated concubine of the licentious King Edward IV. was the wife of Mr Matthew Shore, a goldſmith in Lombard-ſtreet, London. Kings are ſeldom unſucceſsful in their amorous purſuits; therefore there was nothing wonderful in Mrs Shore's removing from Lombard-ſtreet to ſhine at court as the royal favourite. Hiſtorians repreſent her as extremely beautiful, remarkably cheerful, and of moſt uncommon generoſity. The king, it is ſaid, was no leſs captivated with her temper than with her perſon: ſhe never made uſe of her influence over him to the prejudice of any perſon; and if ever ſhe importuned him, it was in favour of the unfortunate. After the death of Edward, she attached herself to the lord Hastings; and when Richard III. cut off that nobleman as an obstacle to his ambitious schemes, Jane Shore was arrested as an accomplice, on the ridiculous accusation of witchcraft. This, however, terminated only in a public penance; excepting that Richard rifled her of all her little property: but whatever severity might have been exercised towards her, it appears that she was alive, though sufficiently wretched, under the reign of Henry VIII. when Sir Thomas More saw her poor, old, and shrivelled, without the least trace of her former beauty. Mr Rowe, in his tragedy of Jane Shore, has adopted the popular story related in the old historical ballad, of her perishing by hunger in a ditch where Shoreditch now stands. But Stow assures us that street was so named before her time.

SHORL. See SCHORL, MINERALOGY *Index*.

SHORLING and MORLING, are words to distinguish fells of sheep; *shorling* being the fells after the fleeces are shorn off the sheep's back; and *morling*, the fells flead off after they die or are killed. In some parts of England they understand by a *shorling*, a sheep whose face is shorn off; and by a *morling*, a sheep that dies.

SHORT, JAMES, an eminent optician, was born in Edinburgh on the 10th of June, O. S. in the year 1710. At ten years of age, having lost his father and mother, and being left in a state of indigence, he was received into Heriot's Hospital, (see *EDINBURGH, Public Buildings*, N° 16.), where he soon displayed his mechanical genius in constructing, for himself, little chests, bookcases, and other conveniences, with such tools as fell in his way. At the age of twelve he was removed from the Hospital to the High School, where he showed a considerable taste for classical literature, and generally kept at the head of his forms. In the year 1726 he was entered into the university, where he passed through the usual course of education, and took his master's degree with great applause.

By his friends he was intended for the church; but after attending a course of theological lectures, his mind revolted from a profession which he thought little suited to his talents; and he devoted his whole time to mathematical and mechanical pursuits He had been fortunate enough to have the celebrated M'Laurin for his preceptor; who having soon discovered the bent of his genius, and made a proper estimate of the extent of his capacity, encouraged him to prosecute those studies in which nature had qualified him to make the greatest figure. Under the eye of that eminent master, he began in 1732 to construct Gregorian telescopes; and, as the professor observed in a letter to Dr Jurin, "by taking care of the figure of his specula, he was enabled to give them larger apertures, and to carry them to greater perfection, than had ever been done before him." (See OPTICS, N° 89.).

In the year 1736 Mr Short was called to London, at the desire of Queen Caroline, to give instructions in mathematics to William duke of Cumberland; and immediately on his appointment to that very honourable office he was elected a fellow of the royal society, and patronized by the earls of Morton and Macclesfield. In the year 1739 he accompanied the former of those noble lords to the Orkney isles, where he was employed in adjusting the geography of that part of Scotland; and happy it was for him that he was so employed, as he might otherwise have been involved in a scuffle which took place between the retainers of Sir James Stewart of Barra and the attendants of the earl, in which some of the latter were dangerously wounded.

Mr Short having returned to London, and finally established himself there in the line of his profession, was in 1742 employed by Lord Thomas Spencer to make for him a reflector of twelve feet focus, for which he received 600 guineas. He made several other telescopes of the same focal distance with greater improvements and higher magnifiers; and in 1752 finished one for the king of Spain, for which, with its whole apparatus, he received 1200l. This was the noblest instrument of the kind that had then been constructed, and perhaps it has never yet been surpassed except by the astonishing reflectors of Herschel. See TELESCOPE.

Mr Short used to visit the place of his nativity once every two or three years during his residence in London, and in 1766 he visited it for the last time. On the 15th of June 1768 he died, after a very short illness, at Newington Butts, near London, of a mortification in his bowels, and was buried on the 22d of the same month, having completed, within a few days, his fifty-eighth year. He left a fortune of about 20,000l. of which 15,000l. was bequeathed to two nephews, and the rest in legacies to his friends. In gratitude for the steady patronage of the earl of Morton, he left to his daughter the lady Mary Douglas, afterwards countess of Aboyne, 1000l. and the reversion of his fortune, should his nephews die without issue; but this reversionary legacy the lady, at the desire of her father, generously relinquished by a deed in favour of Mr Short's brother Mr Thomas Short and his children. Mr Short's eminence as an artist is universally known, and we have often heard him spoken of by those who were acquainted with him from his youth, as a man of virtue and of very amiable manners.

SHORT-Hand Writing. See STENOGRAPHY.

SHORT-Jointed, in the *Manege*. A horse is said to be short jointed that has a short pastern; when this joint, or the pastern is too short, the horse is subject to have his fore legs from the knee to the cornet all in a straight line. Commonly your short-jointed horses do not manege so well as the long-jointed; but out of the manege the short-jointed are the best for travel or fatigue.

SHORT Sightedness, a certain defect in vision, by which objects cannot be distinctly seen unless they are very near the eye. See OPTICS, N° 142.

SHORTFORD, q. d. *fore-close*, an ancient custom in the city of Exeter, when the lord of the fee cannot be answered rent due to him out of his tenement, and no distress can be levied for the same. The lord is then to come to the tenement, and there take a stone, or some other dead thing off the tenement, and bring it before the mayor and bailiff, and thus he must do seven quarter days successively; and if on the seventh quarter-day the lord is not satisfied of his rent and arrears, then the tenement shall be adjudged to the lord to hold the same a year and a day; and forthwith proclamation is to be made in the court, that if any man claims any title to the said tenement, he must appear within the year and day next following, and satisfy the lord of the said rent and arrears: but if no appearance be made, and the rent not paid, the lord comes again to the court,

court, and prays that, according to the cuftom, the faid tenement be adjudged to him in his demefne as of fee, which is done accordingly, fo that the lord hath from thenceforth the faid tenement, with the appurtenances to him and his heirs.

SHOT, a denomination given to all forts of balls for fire-arms: thofe for cannon being of iron, and thofe for guns, piftols, &c. of lead. See SHOOTING.

Cafe SHOT formerly confifted of all kinds of old iron, nails, mufket-balls, ftones, &c. ufed as above.

SHOT of a Cable, on fhip-board, is the fplicing of two cables together, that a fhip may ride fafe in deep waters and in great roads; for a fhip will ride eafier by one fhot of a cable, than by three fhort cables out ahead.

Grape-SHOT. See *GRAPE-Shot.*

Patent-milled SHOT is thus made: Sheets of lead, whofe thicknefs correfponds with the fize of the fhot required, are cut into fmall pieces, or cubes, of the form of a die. A great quantity of thefe little cubes are put into a large hollow iron cylinder, which is mounted horizontally and turned by a winch; when by their friction againft one another and againft the fides of the cylinder, they are rendered perfectly round and very fmooth. The other patent fhot is caft in moulds, in the fame way as bullets are.

SHOT Flaggon, a fort of flaggon fomewhat bigger than ordinary, which in fome counties, particularly Derbyfhire, it is the cuftom for the hoft to ferve his guefts in, after they have drank above a fhilling.

Small SHOT, or that ufed for fowling, fhould be well fized, and of a moderate bignefs: for fhould it be too great, then it flies thin, and fcatters too much; or if too fmall, then it hath not weight and ftrength to penetrate far, and the bird is apt to fly away with it. In order, therefore, to have it fuitable to the occafion, it not being always to be had in every place fit for the purpofe, we fhall fet down the true method of making all forts and fizes under the name of *mould-fhot*. Its principal good properties are to be round and folid.

Take any quantity of lead you think fit, and melt it down in an iron veffel; and as it melts keep it ftirring with an iron ladle, fkimming off all impurities whatfoever that may arife at the top: when it begins to look of a greenifh colour, ftrew on it as much auripigmentum or yellow orpiment, finely powdered, as will lie on a fhilling, to every 12 or 14 pound of lead; then ftirring them together, the orpiment will flame.

The ladle fhould have a notch on one fide of the brim, for more eafily pouring out the lead; the ladle muft remain in the melted lead, that its heat may be the fame with that of the lead, to prevent inconveniences which otherwife might happen by its being either too hot or too cold: then, to try your lead, drop a little of it into water, and if the drops prove round, then the lead is of a proper heat; if otherwife, and the fhot have tails, then add more orpiment to increafe the heat, till it be found fufficient.

Then take a plate of copper, about the bignefs of a trencher, which muft be made with a hollownefs in the middle, about three inches compafs, within which muft be bored about 40 holes according to the fize of the fhot which you intend to caft: the hollow bottom fhould be thin; but the thicker the brim, the better it will retain the heat. Place this plate on a frame of iron, over a tub or veffel of water, about four inches from the water, and fpread burning coals on the plate, to keep the lead melted upon it: then take fome lead and pour it gently on the coals on the plate, and it will make its way through the holes into the water, and form itfelf into fhot; do this till all your lead be run through the holes of the plate, taking care, by keeping your coals alive, that the lead do not cool, and fo ftop up the holes.

While you are cafting in this manner, another perfon with another ladle may catch fome of the fhot, placing the ladle four or five inches underneath the plate in the water, by which means you will fee if they are defective, and rectify them.

Your chief care is to keep the lead in a juft degree of heat, that it be not fo cold as to ftop up the holes in your plate, nor fo hot as to caufe the fhot to crack: to remedy the heat, you muft refrain working till it is of a proper coolnefs; and to remedy the coolnefs of your lead and plate, you muft blow your fire; obferving, that the cooler your lead is, the larger will be your fhot; as the hotter it is, the fmaller they will be.

After you have done cafting, take them out of the water, and dry them over the fire with a gentle heat, ftirring them continually that they do not melt; when dry, you are to feparate the great fhot from the fmall, by the help of a fieve made for that purpofe, according to their feveral fizes. But thofe who would have very large fhot, make the lead trickle with a ftick out of the ladle into the water, without the plate.

If it ftop on the plate, and yet the plate be not too cool, give but the plate a little knock, and it will run again; care muft be had that none of your implements be greafy, oily, or the like; and when the fhot, being feparated, are found too large or too fmall for your purpofe, or otherwife imperfect, they will ferve again at the next operation.

The fizes of common fhot for fowling are from N° 1 to 6, and fmaller, which is called muftard feed, or duft fhot; but N° 5 is fmall enough for any fhooting whatfoever. The N° 1 may be ufed for wild geefe; the N° 2 for ducks, widgeons, and other water-fowl; the N° 3 for pheafants, partridges after the firft month, and all the fen-fowl; the N° 4 for partridges, woodcocks, &c.; and the N° 5 for fnipes and all the fmaller birds.

Tin-Cafe SHOT, in artillery, is formed by putting a great quantity of fmall iron fhot into a cylindrical tin-box called a cannifter, that juft fits the bore of the gun. Leaden bullets are fometimes ufed in the fame manner; and it muft be obferved, that whatever number or fizes of the fhots are ufed, they muft weigh with their cafes nearly as much as the fhot of the piece.

SHOVEL, SIR CLOUDESLY, was born about the year 1650 of parents rather in the lower rank of life. He was put apprentice to a fhoemaker; but difliking this profeffion, he abandoned it a few years after, and went to fea. He was at firft a cabin boy with Sir Chriftopher Mynns, but applying to the ftudy of navigation with indefatigable induftry, his fkill as a feaman foon raifed him above that ftation.

The corfairs of Tripoli having committed great outrages on the Englifh in the Mediterranean, Sir John Narborough was fent in 1674 to reduce them to reafon. As he had received orders to try the effects of negociation before he proceeded to hoftilities, he fent Mr Shovel,

Shovel, who was at that time a lieutenant in his fleet, to demand satisfaction. The Dey treated him with a great deal of disrespect, and sent him back without an answer. Sir John dispatched him a second time, with orders to remark particularly the situation of things on shore. The behaviour of the Dey was worse than ever. Upon Mr Shovel's return, he informed Sir John that it would be possible, notwithstanding their fortifications, to burn all the ships in the harbour. The boats were accordingly manned, and the command of them given to Lieut. Shovel, who seized the guardship, and burnt four others, without losing a man. This action so terrified the Tripolins, that they sued for peace.—Sir John Narborough gave so favourable an account of this exploit, that Mr Shovel was soon after made captain of the Sapphire, a fifth rate ship.

In the battle of Bantry-Bay, after the revolution, he commanded the Edgar, and, for his gallant behaviour in that action, was soon after knighted by King William. Next year he was employed in transporting an army into Ireland; a service which he performed with so much diligence and dexterity, that the king raised him to the rank of rear-admiral of the blue, and delivered his commission with his own hands. Soon after he was made rear-admiral of the red, and shared the glory of the victory at La Hogue. In 1694, he bombarded Dunkirk. In 1703, he commanded the grand fleet in the Mediterranean, and did every thing in his power to assist the Protestants who were in arms in the Cevennes.

Soon after the battle off Malaga, he was presented by Prince George to Queen Anne, who received him graciously, and next year employed him as commander in chief.

In 1705 he commanded the fleet, together with the earls of Peterborough and Monmouth, which was sent into the Mediterranean; and it was owing to him chiefly that Barcelona was taken. After an unsuccessful attempt upon Toulon, he sailed for Gibraltar, and from thence homeward with a part of the fleet. On the 22d of October, at night, his ship, with three others, was cast away on the rocks of Scilly. All on board perished. His body was found by some fishermen on the island of Scilly, who stripped it of a valuable ring, and afterwards buried it. Mr Paxton, the purser of the Arundel, hearing of this, found out the fellows, and obliged them to discover where they had buried the body. He carried it on board his own ship to Portsmouth, from whence it was conveyed to London, and interred with great solemnity in Westminster Abbey. A monument was afterwards erected to his memory by the direction of the queen. He married the widow of his patron, Sir John Narborough, by whom he left two daughters, co-heiresses.

SHOVELER, a species of ANAS. See ANAS, ORNITHOLOGY *Index*.

SHOULDER-BLADE, a bone of the shoulder, of a triangular figure, covering the hind part of the ribs, called by anatomists the *scapula* and *omoplata*. See ANATOMY.

SHOUT, CLAMOUR, in antiquity, was frequently used on ecclesiastical, civil, and military occasions, as a sign of approbation, and sometimes of indignation.—Thus as Cicero, in an assembly of the people, was exposing the arrogance of L. Antony, who had had the impudence to cause himself to be inscribed the patron of the Romans, the people on hearing this raised a shout to show their indignation. In the ancient military discipline, shouts were used, 1. Upon occasion of the general's making a speech or harangue to the army from his tribunal. This they did in token of their approving what had been proposed. 2. Before an engagement, in order to encourage and spirit their own men, and fill the enemy with dread. This is a practice of great antiquity; besides which, it wants not the authority of reason to support it; for as mankind are endowed with two senses, hearing and seeing, by which fear is raised in the mind, it may be proper to make use of the ear as well as the eye for that purpose. Shouts were also raised in the ancient theatre, when what was acted pleased the spectators. It was usual for those present at the burning of the dead to raise a great shout, and call the dead person by his name before they set fire to the pile.

SHOWER, in *Meteorology*, a cloud condensed into RAIN.

SHREWMOUSE. See SOREX, MAMMALIA *Index*.

SHREWSBURY, the capital of Shropshire in England. This town, the metropolis of the county, grew up out of the ruins of Uriconium, anciently a city, now a village called *Wroxeter*, about four miles from it. The Saxons called it *Scrobbes Berig*, from the shrubs that grew about it; and from thence the present name of *Shrewsbury* is supposed to have been formed. It is pleasantly situated upon a hill near the Severn, over which there are two handsome bridges. It was a place of note in the Saxon times; after which it was granted by William the Conqueror, together with the title of *earl* and most of the county, to Roger de Montgomery, who built a castle upon the north side of it, where the Severn, that encompasses it on all other sides, leaves an opening. His son Robert built also a wall across this neck of land, when he revolted from Henry I. We learn from doomsday-book, that at that time, when a widow of this town married, she paid 20 shillings to the king, and a virgin 10. The above-mentioned Roger founded also, and endowed here, a Benedictine monastery and a collegiate church. When old age came upon him, he quitted the world, and spent the rest of his days as a monk in the abbey, and when he died was interred in its church. From the history of this church and monastery, it appears that ecclesiastical benefices about that time were hereditary. The abbey became so rich afterwards, that the abbot was mitred, and sat in parliament. Besides this abbey, in after times there were three others, viz. a Franciscan, Dominican, and Augustin; and likewise two collegiate churches, one dedicated to St Chad and the other to St Mary. In the contest between the empress Maud and Stephen, this town and its governor William Fitz-Allan sided with the empress. In Henry III.'s time, a part of it was burnt down by the Welch; and in Richard II.'s reign a parliament was held in it. At a place called *Battle-field*, near this town, Henry Percy the younger, surnamed *Hotspur*, was killed in an engagement with Henry IV. against whom he had rebelled. The king afterwards built a chapel upon the spot, and endowed it for the support of two priests to pray for the souls of the slain. Two of Edward IV.'s sons were born here; namely,

namely, Richard, duke of York, whom Perkin Warbeck afterwards perfonated, and who was murdered in the Tower; and George Plantagenet, who died before his brothers. Here firft broke out the fweating ficknefs, which carried off great numbers fo fuddenly, that thofe who were feized with it either died or recovered in the fpace of 24 hours. In the beginning of the civil wars, King Charles I. came hither, and formed an army, with which he marched towards London; but was met by the parliament's forces at Edgehill. He continued here from the 20th of September to the 12th of October, during which time he was joined by Prince Rupert, and many of the gentry and nobility of thefe parts. This town anciently gave title of earl to the Montgomeries, and afterwards to the Talbots, by whom it is ftill retained. Here is a free grammar-fchool, with three mafters, and feveral ufhers, well endowed by Edward VI. and Queen Elizabeth, and not inferior to many colleges in the univerfities. It has a good library and chapel, and there are feveral fcholarfhips appropriated to it in the univerfity of Cambridge. Here are alfo feveral hofpitals, alms-houfes, and charity-fchools. This town is one of the moft flourifhing in England, having two great weekly markets for corn, cattle, and provifions; and another for Welch cottons and flannels, of which great quantities are fold. A great trade is carried on with the Welch, who bring their commodities hither, as to the common mart of both nations. The town is large and well-built, and the fituation extremely pleafant. There is a very beautiful walk called the *quarry*, between the town walls and the Severn, delightfully fhaded with rows of lime-trees, fo that it is not inferior to the Mall in St James's Park. The town is alfo noted for its gallantry and politenefs, being full of gentry, for whom there are always balls and affemblies once a-week all the year round.—Here is a fine houfe and gardens, which belonged to the earl of Bradford; and in the neighbourhood, at Wroxeter, the Roman highway, called Watling-ftreet, may be feen for feveral miles, where Roman coins are frequently found. In Shrewfbury are 12 incorporated trading companies; and the corporation has a power to try even capital caufes of itfelf, except high treafon. It is faid that thigh-bones of dead men have been found here a yard long, and teeth three inches round and three long.

SHRIKE. See Lanius, Ornithology *Index*.

SHRIMP. See Cancer, Entomology *Index*.

SHRINE, in *Ecclefiaftical Hiftory*, a cafe or box to hold the relics of fome faint.

SHROPSHIRE, a county of England, bounded on the fouth by Worcefterfhire, Herefordfhire, and Radnorfhire; on the north, by Chefhire; on the eaft, by Staffordfhire; on the weft, by Montgomeryfhire and Denbighfhire, in Wales. Its length is between 49 and 50 miles, its breadth about 38, and its circumference about 210. It is an inland county, containing 890,000 acres, 167,639 inhabitants, and 15 hundreds, in which are 170 parifhes, and 15 market towns. It makes a part of three bifhoprics, viz. Hereford, Coventry and Litchfield, and St Afaph. Some part of it lies on the north, and fome on the fouth fide of the Severn. Befides the Severn, it is alfo watered by the *Temd* or *Tefidiauc*, as it is called in Welch, which flows from the mountains of Radnorfhire; and by the Tern, which has its rife and name from one of thofe pools called *tearnes*, in Staffordfhire. All thefe abound with fifh, efpecially trouts, pikes, lampreys, graylings, carp, and eels. The air, efpecially upon the hills, with which the county abounds, is very wholefome. There is as great a diverfity of foil as in moft other counties. On the hills, where it is poor, is very good pafture for fheep; and in the low grounds, where it is very rich, along the Severn in particular, there is plenty of grafs for bay and black cattle, with all forts of corn. This county is abundantly provided with fuel, having in it many extenfive mines of coal; it has alfo mines of lead and iron. Over moft of the coal-pits in this county lies a ftratum or layer of blackifh porous rock, of which, by grinding and boiling, they make pitch and tar, which are rather better than the common fort for caulking fhips, as they do not crack, but always continue clofe and fmooth. Quarries of lime-ftone and iron-ftone are common in the county, and the foil in many places is a reddifh clay. The abundance of coal and iron-ftone in this county has given rife to numerous manufactories.

As it lies upon the borders of Wales, it was anciently full of caftles and walled towns. On the fide next that country there was an almoft continued line of caftles, to guard the county againft the inroads and depredations of the Welch. The borders here, as thofe between England and Scotland, were called *marches*, and there were certain noblemen entitled *barones marchiæ*, *marchiones de marchia Walliæ*, " lords of the marches, or marquiffes of the marches of Wales," who were vefted with a fort of palatine jurifdiction, held courts of juftice to determine controverfies, and enjoyed many privileges and immunities, the better to enable and encourage them to protect the county againft the incurfions of the Welch, and to maintain order amongft the borderers; but they often abufed their power, and were the greateft of tyrants.

As to the ecclefiaftical government of the county, the far greater part, namely, all that belongs to the bifhoprics of Hereford, and of Litchfield and Coventry, is under the jurifdiction and vifitation of the archdeacon of Shrewfbury or Salop, and is divided into feveral deanries.

The Oxford circuit includes in it this county, which fends 12 members to parliament, viz. two for the fhire, and two for each of the following towns, Shrewfbury, Ludlow, Wenlock, and Bifhop's Caftle.

SHROVE-Tuesday, is the Tuefday after Quinquagefima Sunday, or the day immediately preceding the firft of Lent; being fo called from the Saxon word *fhrive*, which fignifies " to confefs." Hence Shrove-Tuefday fignifies Confeffion-Tuefday; on which day all the people in every parifh throughout England (during the Romifh times) were obliged to confefs their fins, one by one, to their own parifh-priefts, in their own parifh-churches; and, that this might be done the more regularly, the great bell in every parifh was rung at ten o'clock (or perhaps fooner), that it might be heard by all, and that they might attend, according to the cuftom then in ufe. And though the Romifh religion has now given way to the Proteftant religion, the cuftom of ringing the great bell in our ancient parifh-churches, at leaft in fome of them, ftill remains, and obtains in and about London the name of Pancake bell; perhaps, becaufe after the confeffion it was cuftomary for the feveral perfons to dine on pancakes or fritters. Moft churches,

churches, indeed, have rejected that cuftom of ringing the bell on Shrove-Tuefday; but the ufage of dining on pancakes or fritters, and fuch like provifion, ftill continues.

SHROUDS (*fcrud* Sax.), a range of large ropes extending from the maft heads to the right and left fide of the fhip, to fupport the mafts, and enable them to carry fail, &c.

The fhrouds as well as the fails are denominated from the mafts to which they belong. Thus they are the main, fore, and mizen fhrouds; the main-top-maft, fore-top-maft, or mizen-top maft fhrouds; and the main-top-gallant, fore-top-gallant, or mizen-top-gallant fhrouds. The number of fhrouds by which a maft is fuftained, as well as the fize of rope of which they are formed, is always in proportion to the fize of the maft and the weight of the fail it is intended to carry.

Bowfprit fhrouds are thofe which fupport the bowfprit. Bumkin fhrouds are thofe which fupport the bumkins. Futtock fhrouds are fhrouds which connect the efforts of the topmaft fhrouds to the lower fhrouds. Bentinck fhrouds are additional fhrouds to fupport the mafts in heavy gales. Preventer fhrouds are fimilar to bentinck fhrouds, and are ufed in bad weather to eafe the lower rigging. See MAST and SAIL.

SHRUB, *frutex*, a little, low, dwarf tree, or a woody vegetable, of a fize lefs than a tree; and which, inftead of one fingle ftem, frequently from the fame root puts forth feveral fets or ftems. See PLANT and TREE. Such are privet, phillyrea, holly, box, honey-fuckle, &c. Shrubs and trees put forth in autumn a kind of buttons, or gems, in the axis of the leaves; thefe buttons are as fo many little ova, which, coming to expand by the warmth of the following fpring, open into leaves and flowers. By this, together with the height, fome diftinguifh fhrubs from *fuffrutices*, or under fhrubs, which are low bufhes, that do not put forth any of thefe buttons, as fage, thyme, &c.

The two hardieft fhrubs we are poffeffed of are the ivy and box; thefe ftand the feverity of our fharpeft winters unhurt, while other fhrubs perifh, and trees have their folid bodies fplit and torn to pieces. In the hard winter of the year 1683, thefe two fhrubs fuffered no injury any where; though the yews and hollies, which are generally fuppofed very hardy, were that winter in fome places killed, and in others ftripped of their leaves, and damaged in their bark. Furze-bufhes were found to be fomewhat hardier than thefe, but they fometimes perifhed, at leaft down to the root. The broom feemed to occupy the next ftep of hardinefs beyond thefe. This lived where the others died, and where even this died, the juniper fhrubs were fometimes found unhurt. This laft is the only fhrub that approaches to the hardinefs of the box and ivy, but even it does not quite come up to them; for while they fuffer nothing in whatever manner they are expofed, the juniper, though it bears cold well under the fhelter of other trees, yet cannot bear the viciffitudes of heat and cold; infomuch that fome juniper fhrubs were found half dead and half vigorous; that fide which faced the mid-day fun having perifhed by the fucceffive thawings and freezings of its fap; while that which was not expofed to the viciffitudes of heat had born the cold perfectly well. Such fhrubs as are not hardy enough to defy the winter, but appear half dead in the fpring, may often be recovered by Mr Evelyn's method of beating their branches with a flender hazel-wand, to ftrike off the withered leaves and buds, and give a free paffage to the air to the internal parts. Where this fails, the method is to cut them down to the quick, and if no part of the trunk appears in a growing condition, they muft be taken off down to the level of the ground. Philofophical Tranfactions, N° 165.

SHUTTLE, in the manufactures, an inftrument ufed by the weavers, which guides the thread it contains, either of woollen, filk, flax, or other matter, fo as to make it form the woofs of ftuffs, cloths, linens, ribbands, &c. by throwing the fhuttle alternately from left to right, and from right to left, acrofs between the threads of the warp, which are ftretched out lengthwife on the loom.

In the middle of the fhuttle is a kind of cavity, called the *eye* or *chamber* of the fhuttle; wherein is inclofed the fpoul, which is a part of the thread deftined for the woof; and this is wound on a little tube of paper, rufh, or other matter.

The ribband-weaver's fhuttle is very different from that of moft other weavers, though it ferves for the fame purpofe: it is of box, fix or feven inches long, one broad, and as much deep; fhod with iron at both ends, which terminate in points, and are a little crooked, the one towards the right, and the other towards the left, reprefenting the figure of an ∽ horizontally placed. See WEAVING.

SIALOGOGUES, medicines which promote the falivary difcharge.

1 Boundaries and extent.

SIAM PROPER, by fome called *Upper*, (to diftinguifh it from the *Lower* Siam, under which are often included Laos, Cambodia, and Malacca), is bounded on the north by the kingdoms of Pegu and Laos; on the eaft by Cambodia and Cochin-China; on the fouth by Malacca and the bay of Siam; and on the weft by the ocean. But as the opinions of geographers are extremely various concerning the fituation and extent of moft of the inland countries of Afia and Africa, neither the extent nor boundaries of Siam are yet accurately known. By fome it is fuppofed to extend 550 miles in length, and 250 miles in breadth; in fome places it is not above 50 miles broad.

2 Weather.

The winds blow here from the fouth upon the coaft of Siam, in March, April, and May; in April the rains begin, in May and June they fall almoft without ceafing. In July, Auguft, and September, the winds blow from the weft, and the rains continuing, the rivers overflow their banks nine or ten miles on each fide, and for more than 150 miles up the ftream. At this time, and more particularly in July, the tides are fo ftrong as to come up the river Menan as far as the city of Siam, which is fituated 60 miles from its mouth; and fometimes as far as Louvo, which is 50 miles higher. The winds blow from the weft and north in October, when the rain ceafes. In November and December the winds blow dry from the north, and the waters being in a few days reduced to their ancient channels, the tides become fo infenfible, that the water is frefh at the mouth of the river. At Siam there is never more than one flood and one ebb in the fpace of 24 hours. In January the wind blows from the eaft, and in February from the eaft and fouth. When the wind is at eaft, the

Siam.

the current ſets to the weſt; and, on the contrary, when the wind is at weſt, the currents run to the eaſtward.

As this country is ſituated near the tropic, it muſt neceſſarily be very hot; but yet, as in other places nearly of the ſame latitude, when the ſun is vertical and ſhines with a moſt intenſe heat, the inhabitants are ſo ſkreened by the clouds, and the air is ſo refreſhed by a deluge of rain that overflows the plains which the people chiefly inhabit, that the heat is very ſupportable. The cooleſt wind blows in December and January.

3 Vegetable productions.

The vegetable produce of this country is chiefly rice and wheat, beſides tropical and a few European fruits. The Siameſe prepare the land for tillage as ſoon as the earth is ſufficiently moiſtened by the floods. They plant their rice before the waters riſe to any conſiderable height, and, as they riſe ſlowly, the rice keeps pace with them, and the ear is always above the water. They reap their corn when the water retires, and ſometimes go in boats to cut it while the waters are upon the ground. They alſo ſow rice in ſeveral parts of the kingdom that are not overflowed, and this is thought better taſted, and will keep longer than the other; but they are forced to ſupply theſe fields conſtantly with water, while the rice is growing, from baſins and ponds that lie about them.

They have no European fruits except oranges, lemons, citrons, and pomegranates. They have bananas, Indian figs, jaques, durions, mangoes, mangoſtans, tamarinds, ananas, and cocoa nuts; they have alſo abundance of pepper and ſugar-canes. The mountains are covered with trees which make good maſts. The vegetable of greateſt uſe in the country is the bamboo, which grows chiefly in marſhy ſoils, and is often found of a prodigious ſize. Cotton trees are found in great numbers; and others that yield *capoc*, a very fine cotton wool, but ſo ſhort as to be unfit for ſpinning, though it anſwers very well for ſtuffing mattreſſes and pillows.

4 Animals.

There is no country where elephants abound more than in Siam, or where they are held in greater veneration. They have a few horſes, ſheep, and goats, beſides oxen and buffaloes; but they have no good animal food except the fleſh of hogs, their beef and mutton being of a very indifferent quality.

5 Deſcription of the inhabitants.

The Siameſe are of ſmall ſtature, but well proportioned; their complexions are ſwarthy: the faces of both the men and women are broad, and their foreheads, ſuddenly contracting, terminate in a point, as well as their chins. They have ſmall black eyes, hollow jaws, large mouths, and thick pale lips. Their teeth are dyed black, their noſes are ſhort and round at the end, and they have large ears, which they think very beautiful. Their hair is thick and lank, and both ſexes cut it ſo ſhort that it reaches no lower than their ears; the women make it ſtand up on their foreheads; and the men ſhave their beards.

6 Dreſs.

People of diſtinction wear a piece of calico tied about their loins, that reaches down to their knees.—The men bring up this cloth between their legs, and tuck it into their girdles, which gives it the appearance of a pair of breeches. They have alſo a muſlin ſhirt without a collar, with wide ſleeves, no wriſtbands, and the boſom open. In winter they wear a piece of ſtuff or painted linen over their ſhoulders, like a mantle, and wind it about their arms.

The king of Siam is diſtinguiſhed by wearing a veſt of brocaded ſatin, with ſtraight ſleeves that reach down to the wriſt, under ſuch a ſhirt as we have juſt deſcribed, and it is unlawful for any ſubject to wear this dreſs unleſs he receives it from the king. They wear ſlippers with piked toes turned up, but no ſtockings. The king ſometimes preſents a military veſt to the generals; this is buttoned before, and reaches to the knees; but the ſleeves are wide, and come no lower than the elbows. All the retinue of the king, either in war or in hunting, are clothed in red. The king wears a cap in the form of a ſugar-loaf, encompaſſed by a coronet or circle of precious ſtones, and thoſe of his officers have a circle of gold, ſilver, or of vermilion gilt, to diſtinguiſh their quality; and theſe caps are faſtened with a ſtay under the chin; they are only worn when they are in the king's preſence, or when they preſide in courts of juſtice, and on other extraordinary occaſions. They have alſo hats for travelling; but, in general, few people cover their heads notwithſtanding the ſcorching heat of the ſun.

The women alſo wrap a cloth about their middle, which hangs down to the calf of their legs. They cover their breaſts with another cloth, the ends of which hang over their ſhoulders. But they have no garment correſponding to a ſhift, nor any covering for their heads but their hair. The common people are almoſt naked, and wear neither ſhoes nor ſlippers. The women wear as many rings on the three laſt fingers of each hand as they can keep on, and bracelets upon their wriſts and ancles, with pendants in their ears ſhaped like a pear.

7 Manners and cuſtoms.

For an inferior to ſtand before a ſuperior is deemed inſolent; and therefore ſlaves and people of inferior rank ſit upon their heels, with their heads a little inclined, and their joined hands lifted up to their foreheads. In paſſing by a ſuperior they bend their bodies, joining their hands, and lifting them toward their heads in proportion to the reſpect they would ſhow. When an inferior pays a viſit, he enters the room ſtooping, proſtrates himſelf, and then remains upon his knees, ſitting upon his heels without ſpeaking a word till he is addreſſed by the perſon whom he viſits; for he that is of the higheſt quality muſt always ſpeak firſt. If a perſon of rank viſits an inferior, he walks upright, and the maſter of the houſe receives him at the door, and waits on him ſo far when he goes away, but never farther.

The higheſt part of the houſe is eſteemed the moſt honourable, and no perſon cares to lodge under another's feet. The Siameſe indeed have but one ſtory, but the rooms riſe gradually, and the innermoſt, which are the higheſt, are always the moſt honourable. When the Siameſe ambaſſador came to the French court, ſome of his retinue were lodged in a floor over the ambaſſador's head; but they no ſooner knew it, than they were ſtruck with the greateſt conſternation, and ran down tearing their hair at the thoughts of being guilty of what they conſidered as ſo unpardonable a crime.

The Siameſe never permit ſuch familiarities as are practiſed by gentlemen in Europe. Eaſineſs of acceſs, and

Siam. and affability to inferiors, is in that part of the world thought a ſign of weakneſs, and yet they take no notice of ſome things which would be looked upon as ill breeding among us; ſuch as belching in company, which no man endeavours to prevent, or ſo much as holds his hand before his mouth. They have an extraordinary reſpect for the head, and it is the greateſt affront to ſtroke or touch that of another perſon; nay, their cap muſt not be uſed with too much familiarity; for when a ſervant carries it, it is put on a ſtick and held above his head; and when the maſter ſtands ſtill the ſtick is ſet down, it having a foot to ſtand upon. They alſo ſhow their reſpect by lifting their hands to the head; and therefore, when they receive a letter from any one for whom they have a great reſpect, they immediately hold it up to their heads, and ſometimes lay it upon their heads.

8 Genius and diſpoſitions. They are eſteemed an ingenious people, and though rather indolent than active in diſpoſition, they are not addicted to the voluptuous vices which often accompany a ſtate of eaſe, being remarkably chaſte and temperate, and even holding drunkenneſs in abhorrence.—They are, however, accounted inſolent towards their inferiors, and equally obſequious to thoſe above them; the latter of which qualities appears to be particularly inculcated from their earlieſt youth. In general, their behaviour is extremely modeſt, and they are averſe to loquacity. Like the Chineſe, they avoid ſpeaking in the firſt perſon: and when they addreſs a lady, it is always with ſome reſpectful epithet, inſinuating perſonal accompliſhments.

No man in this country learns any particular trade, but has a general knowledge of all that are commonly practiſed, and every one works ſix months for the king by rotation; at which time, if he ſhould be found perfectly ignorant of the buſineſs he is ſet about, he is doomed to ſuffer the baſtinado. The conſequence of this burdenſome ſervice is, that no man endeavours to excel in his buſineſs, leſt he ſhould be obliged to practiſe it as long as he lives for the benefit of the crown.

9 Government. The government of this country is extremely oppreſſive, the king being not only ſovereign but proprietor of all the lands, and chief merchant likewiſe; by which means he monopolizes almoſt the whole traffic, to the great prejudice of his ſubjects. The crown is ſaid to be hereditary, but it is often transferred by revolutions, on account of the exorbitant abuſe of power in thoſe who exerciſe the royal office. In his palace, the king is attended by women, who not only prepare his food, and wait on him at table, but even perform the part of valets, and put on all his clothes, except his cap, which is conſidered as too ſacred to be touched by any hand but his own. He ſhows himſelf to the people only twice a-year, when he diſtributes his alms to the talapoins or prieſts: and on thoſe occaſions he always appears in an elevated ſituation, or mounted on the back of an elephant. When he takes the diverſion of hunting, he is as uſual attended by his women on foot, preceded by a guard of 200 men, who drive all the people from the roads through which they are to paſs; and when the king ſtops, all his attendants fall upon their faces on the ground.

10 Form of proceſs. All their proceedings in law are committed to writing, and none is ſuffered to exhibit a charge againſt another, without giving ſecurity to proſecute it, and anſwer the damages if he does not prove the fact againſt the perſon accuſed. When a perſon intends to proſecute another, he draws up a petition, in which he ſets forth his complaint, and preſents it to the *nai*, or head of the band to which he belongs, who tranſmits it to the governor; and if the complaint appears frivolous, the proſecutor, according to the laws of the country, ſhould be puniſhed; but the magiſtrates generally encourage proſecutions on account of the perquiſites they bring to their office.

Every thing being prepared for hearing, the parties are ſeveral days called into court, and perſuaded to agree; but this appears to be only a matter of form. At length the governor appoints a day for all parties to attend; and being come into court, the clerk reads the proceſs and opinion of his aſſociates, and then the governor examines upon what reaſons their opinions are founded; which being explained to him, he proceeds to paſs judgement.

11 Trial by ordeal. When ſufficient proofs are wanting, they have recourſe to an ordeal trial, like that of our Saxon anceſtors: both the plaintiff and the defendant walk upon burning coals, and he that eſcapes unhurt is adjudged to be in the right: ſometimes the proof is made by putting their hands in boiling oil; and in both theſe trials, by ſome peculiar management, one or the other is ſaid to remain unhurt. They have alſo a proof by water, in which he who remains longeſt under it is eſteemed innocent. They have another proof, by ſwallowing pills, which their prieſts adminiſter with ſevere imprecations; and the party who keeps them in his ſtomach without vomiting is thought to be innocent.

All theſe trials are made in the preſence of the magiſtrates and people; and the king himſelf frequently directs them to be performed, when crime comes before him by way of appeal. Sometimes he orders both the informer and priſoner to be thrown to the tigers: and the perſon that eſcapes by his not being ſeized upon by thoſe beaſts, is ſufficiently juſtified.

12 Religious opinions. They maintain the doctrine of tranſmigration, believing in a pre-exiſtent ſtate, and that they ſhall paſs into other bodies till they are ſufficiently purified to be received into paradiſe. They believe likewiſe that the ſoul is material, but not ſubject to the touch; that it retains the human figure after quitting a body of that ſpecies; and that when it appears to perſons with whom it was acquainted, which they ſuppoſe it to do, the wounds of one that has been murdered will then be viſible. They are of opinion that no man will be eternally puniſhed; that the good, after ſeveral tranſmigrations, will enjoy perpetual happineſs; but that thoſe who are not reformed will be doomed to tranſmigration to all eternity. They believe in the exiſtence of a Supreme Being; but the objects of their adoration are departed ſaints, whom they conſider as mediators or interceſſors for them; and to the honour of this numerous tribe both temples and images are erected.

13 Marriages. The men of this country are allowed a plurality of women; but excepting one, who is a wife by contract, the others are only concubines, and their children deemed incapable of any legal inheritance. Previous to every nuptial contract, an aſtrologer muſt be conſulted, who calculates the nativity of the parties, and determines whether their union is likely to prove fortunate

Siam || Sibenico.

or otherwife. When his prognoftication is favourable, the lover is permitted to vifit his miftrefs three times, at the laft of which interviews the relations being prefent, the marriage portion is paid, when, without any religious ceremony performed, the nuptials are reckoned complete, and foon after confummated. A few days after the talapoin vifits the married couple, fprinkles them with water, and repeats a prayer for their profperity.

14 Funerals. The practice in Siam refpecting funerals, is both to burn and bury the dead. The corpfe being laid upon the pile, it is fuffered to burn till a confiderable part is confumed, when the remainder is interred in a buryingplace contiguous to fome temple. The reafon which they give for not burning it entirely to afhes is, that they fuppofe the deceafed to be happy when part of his remains efcapes the fire. Inftead of a tombftone, they erect a pyramid over the grave. It was formerly the cuftom to bury treafure with the corpfe; but longer experience evincing, that the facrilegious light in which robbing the graves was confidered did not prevent the crime, they now difcontinue the ancient practice, and inftead of treafure bury only painted papers and other trifles.

15 Rivers. The two principal rivers are the Menan and the Mecon, which rife in the mountains of Tartary, and run to the fouth; the former paffing by the city of Siam, falls into the bay of the fame name, in the 13th degree of north latitude; and the latter running through Laos and Cambodia, difcharges itfelf into the Indian ocean in the 9th degree of north latitude.

6 Defcription of the capital. The capital of the country is Siam, called by the natives *Siyothoya*, fituated in the 101ft degree of eaft longitude, and in the 14th degree of north latitude, being almoft encompaffed by the branches of the river Menan. It is about 10 miles in circumference within the walls, but not a fixth part of the ground is occupied by buildings. In the vacant fpaces there are near 300 pagodas or temples, round which are fcattered the convents of the priefts and their burying-places. The ftreets of the city are fpacious, and fome have canals running through them, over which is a great number of bridges. The houfes ftand on pillars of the bamboo cane, and are built of the fame materials: the communication between different families, during the winter feafon, being carried on as in other tropical countries by means of boats. The grounds belonging to the feveral tenements are feparated by a pallifado, within which the cattle are houfed in barns, erected likewife upon pillars, to preferve them from the annual inundation.

SIBBALDIA, a genus of plants belonging to the clafs of pentandria, and to the order of pentagynia; and in the natural fyftem arranged under the 35th order. *Senticofæ*. See BOTANY *Index*.

SIBENICO, or SEBENICO, the name of a city and province of Dalmatia. The province of Sibenico runs along the fea for more than 30 miles; reaches in fome places above 20 miles within land, and comprehends above 70 iflands. The city of Sibenico is fituated near the mouth of the river Cherca, in the gulf of Venice, 35 miles north of Spalatto, and 25 fouth eaft of Zara. E. Long. 16° 46′. N. Lat. 44° 17′. It belongs to the Venetians. It is defended on one fide by a caftle, which held out againft repeated attacks of the Turks, and towards the fea by a fort.

Siberia.

SIBERIA, a large country, comprehending the moft northerly parts of the Ruffian empire in Afia. It is bounded on the eaft by the eaftern ocean; on the fouth by Great Tartary; on the weft by Ruffia; and on the north by the Frozen ocean. It is about 2000 miles in length from eaft to weft, and 750 miles in breadth from north to fouth. 1 Boundaries and extent.

At what time this country was firft inhabited, or by whom it was peopled, we are entirely ignorant; but writings have been found in it when it was difcovered, which fhows that it muft have been early known to a civilized people *. The Ruffians, from whom we have received our knowledge, knew nothing of it before the middle of the 16th century. In the reign of John Bafilowitz I. indeed, an incurfion had been made into Siberia, and fome Tartar tribes fubdued: but thefe conquefts were not permanent; and we hear of no further communication between Ruffia and Siberia till the time of John Bafilowitz II. It was opened again at that time by means of one Anika Strogonoff, a Ruffian merchant, who had eftablifhed fome falt-works at a town in the government of Archangel. This man carried on a trade with the inhabitants of the north-weft parts of Siberia, who brought every year to the town abovementioned large quantities of the fineft furs. Thus he acquired a very confiderable fortune in a fhort time; when at laft the czar, perceiving the advantages which would accrue to his fubjects from having a regular intercourfe with Siberia, determined to enlarge the communication which was already opened. With this view he fent into Siberia a body of troops, which croffed the Yugorian mountains, that form part of the north-eaftern boundary of Europe. They feem, however, not to have paffed the Irtifh, or to have penetrated farther than the weftern branch of the river Oby. Some Tartar tribes were laid under contribution, and a chief named *Yediger* confented to pay an annual tribute of 1000 fables. But this produced no lafting advantage to Ruffia; for, foon after, Yediger was defeated and taken prifoner by Kutchum Khan, a defcendant of the great Jenghiz Khan: and thus the allegiance of this country to Ruffia was diffolved. 2 Conquered by the Ruffians.

* Bell's Travels.

For fome time we hear of no further attempts made by the Ruffians on Siberia; but in 1577 the foundation of a permanent conqueft was laid by one Yermac Temofeeff, a Coffack of the Don. This man was at firft the head of a party of banditti who infefted the Ruffians in the province of Cafan; but being defeated by the troops of the czar, he retired with 6000 of his followers into the interior parts of that province. Continuing his courfe ftill eaftward, he came to Orel, the moft eafterly of all the Ruffian fettlements. Here he took up his winter-quarters: but his reftlefs genius did not fuffer him to continue for any length of time in a ftate of inactivity; and from the intelligence he procured concerning the fituation of the neighbouring Tartars of Siberia, he turned his arms towards that quarter.

Siberia was at that time partly divided among a number of feparate princes, and partly inhabited by the various tribes of independent Tartars. Of the former Kutchum Khan was the moft powerful fovereign. His dominions confifted of that tract of country which now forms the fouth-weftern part of the province of Tobolfk; and ftretched from the banks of the Irtifh and Oby to 3 State of Siberia at the time of the Ruffian conqueft.

those of the Tobol and Tura. His principal residence was at Sibir, a small fortress upon the river Irtish, not far from the present town of Tobolsk, and of which some ruins are still to be seen. After a course of unremitted fatigue, and a series of victories which almost exceed belief, but of which we have not room to give the detail, our intrepid adventurer dispossessed this prince of his dominions, and seated himself on the throne of Sibir. The number of his followers, however, being greatly reduced, and perceiving he could not depend on the affection of his new subjects, he had recourse to the czar of Muscovy, and made a tender of his new acquisitions to that monarch, upon condition of receiving immediate and effectual support. This proposal was received with the greatest satisfaction by the czar, who granted him a pardon for all former offences, and sent him the required succours. Yermac, however, being soon after drowned in an unsuccessful excursion, the Russians began to lose their footing in the country. But fresh reinforcements being seasonably sent, they not only recovered their ground, but pushed their conquests far and wide; wherever they appeared, the Tartars were either reduced or exterminated. New towns were built, and colonies were planted on all sides. Before a century had well elapsed, all that vast tract of country now called *Siberia*, which stretches from the confines of Europe to the Eastern ocean, and from the Frozen sea to the present frontiers of China, was annexed to the Russian dominions.

4 Climate.

The air of Siberia is, in general, extremely piercing, the cold there being more severe than in any other part of the Russian dominions. The Siberian rivers are frozen very early, and it is late in the spring before the ice is thawed (A). If the corn does not ripen in August, there is little hope of a harvest in this country; and in the

(A) M. Gmelin, M. Muller, and two other philosophers, set out in the year 1733 to explore the dreary regions of Siberia, by desire of the empress Anne of Russia. After spending nine years and a half in observing every thing that was remarkable, they returned to Petersburgh; and an account of this journey was published by M. Gmelin. In order to examine how far the frost had penetrated into the ground, M. Gmelin, on the 18th of June, at a place called Jacutia, ordered the earth to be dug in high ground; they found mould to the depth of 11 inches, under which they met with loose sand to two feet and a half further, after which it grew harder, and at half a foot deeper so hard as scarcely to give way to the tools; so that the ground still remained unthawed at not less than the depth of four feet. He made the same experiment in a lower situation; the soil was 10 inches deep, after that a loose sand for two feet and ten inches, below which all was frozen and hard. At Jacutia the inhabitants preserve in cellars several sorts of berries, which they reckon among their dainties, perfectly good and fresh the whole year, though these cellars are scarcely a fathom deep. At the fortress of Argun, in little more than 50 degrees of latitude, the inhabitants relate that the earth in many places is never thawed above a yard and a half, and that the internal cold of the earth will scarcely permit a well to be dug, of which they bring an instance that happened not long before the author's arrival at that place. They designed to sink a well near a house at some distance from the river Argun, for which purpose they thawed the earth by degrees, and dug some fathoms till they had penetrated a fathom and half below the level of the river, but found no spring. Hence perhaps we may venture to assert, that besides the great elevation of the earth in these countries, there is another cause, perhaps latent in the earth itself, of this extraordinary cold, naturally suggested to us by considering the cavity of an old silver mine at Argun, which being exhausted of its ore, now serves the inhabitants in summer time for a cellar to keep their provisions: this place is so extremely cold as to preserve flesh meats from putrefaction in the hottest summers, and to sink the mercury in De Lisle's thermometer to 146 and 147. The author travelling from Nerschoi towards Argun, to visit the works of the silver mines in that place, August 1735, came to the river Orkija, near Solonischaia, on July the 1st, from whence he arrived a little before dark at the village of Seventua, distant from the river 27 leagues. In this journey he and his fellow travellers for more than four leagues felt it vastly cold; soon after they came into a warm air, which continued some leagues; after which the cold returned; and thus are travellers subjected to perpetual vicissitudes of warmth and cold. But it is observed in general, that the eastern parts are colder than the western, though situated in the same latitude; for as in those eastern regions some tracts of land are much colder than the rest, their effects must be felt by the neighbouring parts. And this conjecture is favoured by the thermometrical observations made with M. de L'Isle's instrument in all parts of Siberia, in which the mercury was depressed to the 226th degree, even in those parts that lie very much towards the south, as in the territory of Selinga, which said degree answers in Fahrenheit's thermometer to about 55.5 below 0, but the same thermometer sometimes indicated a much greater cold. At the fort of Kiringa, on Feb. 10. 1738, at 8 in the morning, the mercury stood at 240. which answers nearly to 72 below 0 in Fahrenheit's. On the 23d of the same month it was a degree lower. At the same place, December 11. at three in the afternoon, it stood at 254 in De Lisle's thermometer, and very near 90 in Fahrenheit's; on December 29. at four in the afternoon, at 263; on November 27. at noon, at 270; January 9. at 275, which several depressions answer in Fahrenheit's to 99.44, 107.73, and 113.65; on January 5. at five in the morning, at 262; an hour after at 281, but at eight o'clock it returned to 250, and there remained till six in the afternoon, and then rose by degrees till an hour before midnight, when it stood at 202. So that the greatest depression of the mercury answers in Fahrenheit's thermometer to 120.76 degrees below 0, which is indeed very surprising, and what nobody ever imagined before. While this cold lasted at Jenisea, the sparrows and magpies fell to the ground, struck dead, as it were, with the frost, but revived if they were soon brought into a warm room. The author was told also that numbers of wild beasts were found in the woods dead and stiff with the frost, and several travellers had their blood and juices quite frozen in their vessels. The air itself at that time was so dismal, that you would think it changed to ice, as it was a thick fog, which was not dissipable by any exhalations, as in the spring and autumn, and the author could scarcely stand three minutes in the porch of his house for the cold.

Siberia. the province of Jeniſeiſk it is ſometimes covered with ſnow before the peaſants can reap it. To defend the inhabitants againſt this extreme ſeverity of the climate, Providence ſeems more liberally to have dealt out to them wood for fuel and furs for clothing. As the winter days in the north parts of Siberia laſt but a few hours, and the ſtorms and flakes of ſnow darken the air ſo much, that the inhabitants, even at noon, cannot ſee to do any thing without artificial lights, they ſleep away the greateſt part of that ſeaſon.

Theſe ſevere winters are rapidly ſucceeded by ſummers, in which the heat is ſo intenſe that the Tunguſians, who live in the province of Jakutſk, go almoſt naked. Here is ſcarcely any night during that ſeaſon; and towards the Frozen ocean the ſun appears continually above the horizon. The vegetables and fruits of the earth are here extremely quick in their growth.

5 Soil and produce. The whole tract of land beyond the 60th degree of north latitude is a barren waſte; for the north part of Siberia yields neither corn nor fruits; though barley is known frequently to come to perfection in Jakutſk.—For this reaſon, the inhabitants of the northern parts are obliged to live on fiſh and fleſh, but the Ruſſians are ſupplied with corn from the ſouthern parts of Siberia, where the ſoil is ſurpriſingly fertile. The countries beyond the lake of Baikal, eſpecially towards the eaſt, as far as the river Argun, are remarkably fruitful and pleaſant; but ſuch is the indolence of the inhabitants, that ſeveral fine tracts of land, which would make ample returns to the peaſant for cultivating them, lie neglected. The paſtures are excellent in this country, which abounds in fine horned cattle, horſes, goats, &c. on which the Tartars chiefly depend for ſubſiſtence. However, there are ſeveral ſteppes, or barren waſtes, and unimprovable tracts in theſe parts; and not a ſingle fruit tree is to be ſeen. There is great variety of vegetables, and in ſeveral places, particularly near Kraſnoia Sloboda, the ground is in a manner overrun with aſparagus of an extraordinary height and delicious flavour. The bulbs of the Turkiſh bundes, and other ſorts of lilies, are much uſed by the Tartars inſtead of bread. This want of fruit and corn is richly compenſated by the great quantities of wild and tame beaſts, and fowls, and the infinite variety of fine fiſh which the country affords (B).

In that part of Siberia which lies near the Icy ſea, as well as in ſeveral other places, are woods of pine, larch, and other trees; beſides which, a conſiderable quantity of wood is thrown aſhore by the waves of the Icy ſea; but whence it comes is not yet aſcertained.

6 Wild beaſts. Beſides the wild fowl with which Siberia abounds, there is a prodigious number of quadrupeds, ſome of which are eatable, and others valuable for their ſkins or furs.

The animals moſt valued for their ſkins are the black fox, the ſable, the hyena, the ermine, the ſquirrel, the beaver, and the lynx. The ſkin of a real black fox is more eſteemed than even that of a ſable. In the country near the Frozen ocean are alſo blue and white foxes. The fineſt ſables come from Nertihinſk and Jakutſk, the inhabitants of which places catch them in the mountains of Stannowoi Krebet. The tributary nations were formerly obliged to pay their taxes in the ſkins of foxes and ſables only. But now the ſkins of ſquirrels, bears, rein-deer, &c. and ſometimes money, are received by way of tribute; and this not only from thoſe who live near the Lena, but alſo in the governments of Ilinſk, Irkutzk, Seleaginſk, and Nertſhinſk. When the Tartars firſt became tributary to Ruſſia, they brought their furs indiſcriminately as they caught them, and among them were often ſables of extraordinary value; and formerly, if any trader brought with him an iron kettle, they gave him in exchange for it as many ſables as it would hold. But they are now better acquainted with their value. They ſell their ſables to ſmugglers at a very high price, and pay only a ruble inſtead of a ſkin to the revenue officers, who now receive more ready money than ſables, by way of tribute. The ſubjects plead the ſcarcity of furs, and indeed not without ſome appearance of truth.

Siberia has ſtill other and more valuable treaſures than thoſe we have yet mentioned. The ſilver mines of Argun are extremely rich; the ſilver they produce yields ſome gold, and both of theſe are found among the copper ore of Koliwan. This country is alſo particularly rich in copper and iron ore. The former lies even upon the ſurface of the earth; and conſiderable mines of it are found in the mountains of Pictow, Koliwan, Ploſkau, Wolkereſenſk, Kuſwi, Alepaik, and ſeveral others, and in the government of Kraſnoiarſk (C). Iron is ſtill more plentiful in all theſe places, and very good; but that of Kamenſki is reckoned the beſt. Several hundred thouſand puds of theſe metals are annually exported from the ſmelting houſes, which belong partly to the crown, and partly to private perſons. Moſt of them lie in the government of Catharinenburg. The Tartars alſo extract a great quantity of iron from the ore. 7 Minerals.

The topazes of Siberia have a fine luſtre; and in open ſandy places, near the river Argun, as well as on the banks of other rivers and lakes, are found ſingle ſmall pieces of agate. Here are alſo carnelians and green jaſper with red veins. The latter is chiefly met with in the deſerts of Gobiſkoi. 8 Precious ſtones.

The famous marienglas, or lapis ſpecularis, great quantities 9 Marienglas.

(B) The oak, though frequent in Ruſſia, it is ſaid, is not to be found through this vaſt region nearer than the banks of the Argun and Amur, in the dominions of China. The white poplar, the aſpen, the black poplar, the common ſallow, and ſeveral ſpecies of the willow, are very common. The Norway and ſilver fir form great foreſts; but the former does not grow beyond the 60th degree of north latitude, and the latter not beyond 58 degrees. To this dreary region of Siberia, Europe is indebted for that excellent ſpecies of oats called *Avena Sibirica;* and our gardens are enlivened with the gay and brilliant flowers brought from the ſame country.

(C) The copper mines of Koliwan, from which gold and ſilver are extracted, employ above 40,000 people. The ſilver mines of Nertſhinſk, beyond Lake Baikal, employ above 14,000. The whole revenue ariſing from theſe mines, according to Mr Coxe, is not leſs than 670,182l. 13s.

Siberia. quantities of which are dug up in Siberia, is by some called Muscovy or Russian glass. It is a particular species of transparent stone, lying in strata like so many sheets of paper. The matrix, or stone in which it is found, is partly a light yellow quartz, or marcassia, and partly a brown indurated fluid; and this stone contains in it all the species of the marienglas. To render the marienglas fit for use, it is split with a thin two-edged knife; but care is taken that the laminæ be not too thin. It is used for windows and lanterns all over Siberia, and indeed in every part of the Russian empire, and looks very beautiful; its lustre and clearness surpassing that of the finest glass, to which it is particularly preferable for windows and lanterns of ships, as it will stand the explosion of cannon. It is found in the greatest plenty near the river Witim.

10 Magnets. Siberia affords magnets of an extraordinary size, and even whole mountains of loadstone. Pit-coal is also dug up in the northern parts of this country. The kamennoe maslo, a yellowish kind of alum, unctuous and smooth to the touch, like tophus, is found in the mountains of Krasnoiarsk, Ural, Altaish, Jenisea, Baikal, Bargusik, Lena, and several others in Siberia.

11 Salt lakes and springs. In this country are not only a great number of fresh water lakes, but likewise several whose waters are salt; and these reciprocally change their nature, the salt sometimes becoming fresh, and the fresh changing into saline. Some lakes also dry up, and others appear where none were ever seen before. The salt lake of Yamusha, in the province of Tobolsk, is the most remarkable of all, for it contains a salt as white as snow, consisting entirely of cubic crystals. One finds also in Siberia saline springs, salt water brooks, and a hill of salt.

12 Curiosities. Siberia affords many other things which deserve notice. That useful root called rhubarb grows in vast quantities near the city of Seleginsk. The curious mammuth's bones and horns, as they are called, which are found along the banks of the Oby, Jenesei, Lena, and Irtish, are unquestionably the teeth and bones of elephants. But whether these elephants teeth and bones were conveyed to these northern regions by the general deluge, or by any other inundation, and were by degrees covered with earth, is a point which might lead us into long and very fruitless disquisitions; we shall therefore only observe, that such bones have likewise been found in Russia, and even in several parts of Germany. A kind of bones of a still larger size than these have also been dug up in Siberia, and seem to have belonged to an animal of the ox kind. The horn of the whale called *narwhal* has been found in the earth near the rivers Indigirka and Anadir; and the teeth of another species of whales, called *wolross*, about Anadirskoi. The latter are larger than the common sort, which are brought from Greenland, Archangel, and Kola.

13 Mountains. The chain of Siberian mountains reaches from that of Werchoturie towards the south as far as the neighbourhood of the city of Orienburg, in a continued ridge, under the name of the Uralian mountains; but from thence it alters its direction westward. These mountains are a kind of boundary between Russia Proper and Siberia. Another chain of hills divides Siberia from the country of the Calmucks and Mongolians.—These mountains, between the rivers Irtish and Oby, are called the Altaic or Golden Mountains, which name they afterwards lose, particularly between the river Jenesei and the Baikal lake, where they are called the Sayanian mountains.

Siberia ‖ Sibyls.

14 Inhabitants. The inhabitants of Siberia consist of the Aborigines or ancient inhabitants, the Tartars, and Russians, computed at 3,500,000.

Some of these nations have no other religion but that of nature; others are Pagans or Mahometans, and some of them have been converted to Christianity, or rather only baptised by the Russian missionaries.

SIBTHORPIA, a genus of plants belonging to the class of didynamia, and to the order of angiospermia; and in the natural system classed with those the order of which is doubtful. See BOTANY *Index*.

SIBYLS, in pagan antiquity, certain women said to have been endowed with a prophetic spirit, and to have delivered oracles, showing the fates and revolutions of kingdoms. Their number is unknown. Plato speaks of one, others of two, Pliny of three, Ælian of four, and Varro of ten; an opinion which is universally adopted by the learned. These ten Sibyls generally resided in the followed places, Persia, Libya, Delphi, Cumæ in Italy, Erythræa, Samos, Cumæ in Æolia, Marpessa on the Hellespont, Ancyra in Phrygia, and Tiburtis. The most celebrated of the Sibyls is that of Cumæ in Italy, whom some have called by the different names of Amalthæa, Demiphile, Herophile, Daphne, Manto, Phemonoe, and Deiphobe. It is said, that Apollo became enamoured of her, and that to make her sensible of his passion he offered to give her whatever she should ask. The Sibyl demanded to live as many years as she had grains of sand in her hand, but unfortunately forgot to ask for the enjoyment of the health, vigour, and bloom, of which she was then in possession. The god granted her request, but she refused to gratify the passion of her lover though he offered her perpetual youth and beauty. Some time after she became old and decrepit, her form decayed, melancholy paleness and haggard looks succeeded to bloom and cheerfulness. She had already lived about 700 years when Æneas came to Italy, and, as some have imagined, she had three centuries more to live before her years were as numerous as the grains of sand which she had in her hand. She gave Æneas instructions how to find his father in the infernal regions, and even conducted him to the entrance of hell. It was usual for the Sibyl to write her prophecies on leaves, which she placed at the entrance of her cave; and it required particular care in such as consulted her to take up these leaves before they were dispersed by the wind, as their meaning then became incomprehensible. According to the most authentic historians of the Roman republic, one of the Sibyls came to the palace of Tarquin the Second, with nine volumes, which she offered to sell for a very high price. The monarch disregarded her, and she immediately disappeared, and soon after returned, when she had burned three of the volumes. She asked the same price for the remaining six books; and when Tarquin refused to buy them, she burned three more, and still persisted in demanding the same sum of money for the three that were left.—This extraordinary behaviour astonished Tarquin; he bought the books, and the Sibyl instantly vanished, and never after appeared to the world. These books were preserved with great care by the monarch, and called the Sibylline verses. A college of priests was appointed to have the care of them; and such reverence did the Romans

Lempriere's Dictionary.

Romans entertain for theſe prophetic books, that they were conſulted with the greateſt ſolemnity, and only when the ſtate ſeemed to be in danger. When the capitol was burnt in the troubles of Sylla, the Sibylline verſes which were depoſited there periſhed in the conflagration; and to repair the loſs which the republic ſeemed to have ſuſtained, commiſſioners were immediately ſent to different parts of Greece to collect whatever verſes could be found of the inſpired writings of the Sibyls. The fate of theſe Sibylline verſes which were collected after the conflagration of the capitol is unknown. There are now many Sibylline verſes extant, but they are reckoned univerſally ſpurious; and it is evident that they were compoſed in the ſecond century by ſome of the followers of Chriſtianity, who wiſhed to convince the heathens of their error, by aſſiſting the cauſe of truth with the arms of pious artifice.

SICERA, a name given to any inebriating liquor by the Helleniſtic Jews. St Chryſoſtom, Theodoret, and Theophilus of Antioch, who were Syrians, and who therefore ought to know the ſignification and nature of "ſicera," aſſure us, that it properly ſignifies palm-wine. Pliny acknowledges, that the wine of the palm tree was very well known through all the eaſt, and that it was made by taking a buſhel of the dates of the palm-tree, and throwing them into three gallons of water; then ſqueezing out the juice, it would intoxicate like wine. The wine of the palm tree is white: when it is drunk new, it has the taſte of the cocoa, and is ſweet as honey. When it is kept longer, it grows ſtrong, and intoxicates. After long keeping, it becomes vinegar.

SICILIAN, in *Muſic*, denotes a kind of gay ſprightly air, or dance, probably invented in Sicily, ſomewhat of the nature of an Engliſh jig; uſually marked with the characters $\frac{6}{8}$, or $\frac{12}{8}$. It conſiſts of two ſtrains; the firſt of four, and the ſecond of eight, bars or meaſures.

1 Boundaries and extent.

SICILY, is a large iſland in the Mediterranean ſea, adjoining to the ſouthern extremity of Italy, and extends from latitude 36° 25′ to latitude 38° 25′, and from longitude 12° 53′ to longitude 16° 5′ eaſt from London. Its greateſt length 210 miles, breadth 133, circumference 600; its form triangular, the three angles being the promontories of Pelorum, Pachynum, and Lilybæum, or as they are now called the Faro, Capo Paſſaro, and Capo Boco. It is divided from Italy by the ſtraits of Meſſina, reaching from the Tower of Faro, which is the moſt northerly part of the iſland, to the *Capo dell' Armi*, or the Cape of Arms, the moſt ſouthern part of Calabria. Theſe ſtraits, by the Latins called *Fretum Siculum*, by the Italians *Il Faro di Meſſina*, and by us the *Faro of Meſſina*, are between 12 and 15 miles over in the broadeſt places, and in the narroweſt about a mile and an half; inſomuch that when Meſſina was taken by the Carthaginians, many of the inhabitants are ſaid to have ſaved themſelves by ſwimming to the oppoſite coaſt of Italy. Hence has ariſen an opinion that the iſland of Sicily was originally joined to the continent, but afterwards ſeparated by an earthquake or ſome other natural cauſe. This ſeparation, however, is reckoned by the moſt judicious among the ancients to be fabulous; and they content themſelves with ſpeaking of it as a thing ſaid to have happened.

2 History during the fabulous ages.

Anciently this iſland was called *Sicania*, *Sicilia*, and *Trinacria* or *Triquetra*; the two former it had from the Sicani and Siculi, who peopled a conſiderable part of the country; the two latter from its triangular figure. Its firſt inhabitants, according to the moſt reſpectable ancient authors, were the Cyclopes and Læſtrigones, who are ſaid to have ſettled in the countries adjoining to Mount Etna; but of their origin we know nothing, except what is related by the poets. After them came the Sicani, who called themſelves the original inhabitants of the country; but ſeveral ancient hiſtorians inform us that they came from a country in Spain watered by the river Siconus. Diodorus, however, is of opinion, that the Sicani were the moſt ancient inhabitants of this iſland. He tells us that they were in poſſeſſion of the whole, and applied themſelves to cultivate and improve the ground in the neighbourhood of Etna, which was the moſt fruitful part of the iſland: they built ſeveral ſmall towns and villages on the hills to ſecure themſelves againſt thieves and robbers; and were governed, not by one prince, but each city and diſtrict by its own king. Thus they lived till Etna began to throw out flames, and forced them to retire to the weſtern parts of the iſland, which they continued to inhabit in the time of Thucydides. Some Trojans, after the deſtruction of their city, landed in the iſland, ſettled among the Sicani, and built the cities of Eryx and Egeſta, uniting themſelves with them, and taking the general name of Elymi or Elymæi. They were afterwards joined by ſome Phocenſes, who ſettled here on their return from the ſiege of Troy.

After the Sicani had for many ages enjoyed an undiſturbed poſſeſſion of the whole of Sicily, or ſuch parts of it as they choſe to inhabit, they were viſited by the Siculi, who were the ancient inhabitants of Auſonia properly ſo called; but being driven out from thence by the Opici, they took refuge in the iſland of Sicily. Not being contented with the narrow bounds allowed them by the Sicani, they began to encroach upon their neighbours; upon which a war enſuing, the Sicani were utterly defeated, and confined to a corner of the iſland, the name of which was now changed from *Sicania* into that of *Sicilia*.

About 300 years after the arrival of the Siculi, the iſland firſt began to be known to the Greeks, who eſtabliſhed various colonies, and built many cities in different parts of the iſland; and it is only from the time of their arrival that we have any hiſtory of the iſland. The firſt of the Greeks that came into Sicily were the Chalcidians of Eubœa, under the conduct of Thucles, who built Naxus, and a famous altar of Apollo, which, as Thucydides tells us, was ſtill ſtanding in his time without the city. The year after, which was, according to Dionyſius Halicarnaſſenſis, the third of the 17th Olympiad, Archias the Corinthian, one of the Heraclidæ, laid the foundations of Syracuſe. Seven years after, a new colony of Chalcidians founded Leontini and Catana, after having driven out the Siculi, who inhabited that tract. About the ſame time Lamis, with a colony from Megara, a city of Achaia, ſettled on the river Pantacius, at a place called *Trotilum*, where his adventurers lived ſome time in common with the Chalcidians of Leontini; but, being driven from thence by the Leontines, he built the city of Thapſus, where he died. Upon his death, the colony left Thapſus; and under the conduct of Hyblon king of the Siculi, founded Megara Hyblæa, where they reſided 245 years, till they

Sicily.

they were driven out by Gelon tyrant of Syracuse. During their abode at Megara, they sent one Pamilus, who was come from Megara in Achaia, their original city, to build Selinus. This city was founded about 100 years after the foundation of Megara. Antiphemus and Entimus, the former a Rhodian, the other a Cretan, led each a colony of their countrymen, and jointly built the city of Gela on a river of the same name, establishing in their new settlement the Doric customs, about 45 years after the founding of Syracuse. The inhabitants of Gela founded Agrigentum 108 years after their arrival in Sicily, and introduced the same customs there. A few years after, Zancle was built by the pirates of Cumæ in Italy; but chiefly peopled by the Chalcidians, Samians, and Ionians, who chose rather to seek new settlements than live under the Persian yoke. Some time after, Anaxales, tyrant of Rhegium, drove out the ancient proprietors; and, dividing his lands amongst his followers, called the city *Messana* or *Messene*, which was the name of his native city in Peloponnesus. The city of Himera was founded by the Zancleans under the direction of Eucleides, Simus, and Sacon; but peopled by the Chalcidians and some Syracusan exiles, who had been driven out by the contrary faction.

The Syracusans built Acræ, Chasmenæ, and Camarina; the first 70 years, the second 90, and the third 135, after the foundation of their own city. This is the account which Thucydides, a most judicious and exact writer, gives us of the various nations, whether Greeks or Barbarians, who settled in Sicily. Strabo counts among the ancient inhabitants of Sicily the Morgetes, who being driven out of Italy by the Oenotrians, settled in that part of the island where the ancient city of Morgantium stood. The Campani, who assumed the name of *Mamertini*, that is, *invincible warriors*, and the Carthaginians, who settled very early in Sicily, ought likewise to be counted among the ancient inhabitants of the island.

Before this period the history of Sicily is blended with fables like the early history of almost every other country. After the settlement of the Greeks in the island, its various revolutions have been traced from their several sources by many writers; but by none with greater accuracy than Mr Swinburne. From his account of his Travels in the Two Sicilies, we have therefore taken the following concise history of this kingdom, which will at once gratify such of our readers as interest themselves in the fate of a generous people who long struggled in vain for freedom; and at the same time afford them a specimen of the entertainment they may receive from the very elegant work of the author.

Swinburne's *Travels in the Two Sicilies*, vol. i. p. 176.

"Aristocracy prevailed at first in the Greek settlements, but soon made way for tyranny; which in its turn was expelled by democracy. One of the earliest destroyers of common liberty was Phalaris of Agrigentum, who reigned 600 years before Christ: his example was contagious; a legion of tyrants sprung up, and not a commonwealth in the island escaped the lash of an usurper. Syracuse was most oppressed and torn to pieces by dissension; as its wealth and preponderance in the general scale held out a greater temptation than other cities to the ambition of wicked men. It requires the combined testimony of historians to enforce our belief of its wonderful prosperity, and the no less extraordinary tyranny of some of its sovereigns. These Grecian colonies attained to such excellence in arts and sciences as emboldened them frequently to vie with the learned and ingenious in the mother country; nay, often enabled them to bear away the palm of victory: there needs no stronger proof of their literary merits than a bare recital of the names of Archimedes, Theocritus, Gorgias, and Charondas.

3
Grecian colonies in Sicily.

4
Carthaginians conquer great part of it.

"But the Sicilian Greeks were not destined to enjoy the sweets of their situation without molestation. Very soon after their arrival, the inhabitants of the neighbouring coast of Africa began to aspire to a share of Sicily. Carthage sent large bodies of forces at different times to establish their power in the island, and about 500 years before the Christian era had made themselves masters of all the western parts of it. The Siculi retained possession of the midland country, and the southern and eastern coasts were inhabited by the Greeks.

5
Gelo chosen king.

"About that time Gelo was chosen prince of Syracuse on account of his virtues, which grew still more conspicuous after his exaltation: had the example he set been followed by his successors, the advantages of freedom would never have been known or wished for by the Syracusans. The Carthaginians found in him a vigorous opponent to their project of enslaving Sicily, a project invariably pursued but never accomplished.

6
Is succeeded by Hiero.

"Hiero succeeded his brother Gelo, and, contrary to the usual progression, began his reign by a display of bad qualities. Sensible of his error, and improved by experience, he afterwards adopted more equitable measures. At his death the Syracusans threw off the yoke, and for sixty years revelled in all the joys of freedom. Their peace was, however, disturbed by the Athenians and the Carthaginians. The latter plundered Agrigentum, and threatened ruin to the rest of the Grecian states; but a treaty of peace averted that storm. The Athenians, under pretence of supporting their allies the people of Segesta, but in reality from a thirst of dominion, invested Syracuse with a formidable land and naval armament under the command of Nicias; in consequence of a rash indigested plan, ill conducted attacks, and inadequate supplies, their whole host was cut to pieces or led away into captivity.

7
Dionysius the elder and younger.

"Syracuse had scarcely time to breathe after her victory ere intestine wars broke out, and raised Dionysius to supreme command. Avarice, despotism, and cruelty, marked every day of his reign; but his military enterprises were crowned with constant success. He died in peace, and bequeathed a powerful sovereignty to a son of his name tainted with the same and worse vices, but not endowed with equal capacity and martial ability: in such hands the rod of tyranny ceased to be formidable, and the tyrant was driven out of Sicily by the patriotic party; but matters were not sufficiently settled for popular government, and Dionysius resumed the sceptre for a while, till Timoleon forced him into perpetual exile."

8
Agathocles the tyrant.

Liberty seemed now to be established on a permanent basis; but in Syracuse such prospects always proved illusory. Agathocles, a tyrant more inhuman than any preceding usurper, seized the throne, and deluged the country with blood. He was involved in a perilous contest with the Carthaginians, who obtained many advantages

Sicily.

vantages over him, drove his troops from poſt to poſt, and at laſt blocked up his capital. In this deſperate ſituation, when all foreign helps were precluded, and hardly a reſource remained at home, the genius of Agathocles compaſſed his deliverance by a plan that was imitated among the ancients by Hannibal, and among the moderns by the famous Cortes. He embarked with the flower of his army; forced his way through innumerable obſtacles; landed in Africa; and, having burnt his fleet, routed the Carthaginians in a pitched battle, and laid their territory waſte. Carthage ſeemed to be on the brink of ruin, and that hour might have marked her downfal had the Sicilian hoſt been compoſed of patriotic ſoldiers, and not of ungovernable aſſaſſins; diſcord pervaded the victorious camp, murder and riot enſued; and the tyrant, after beholding his children and friends butchered before his face, eſcaped to Sicily, to meet a death as tragical as his crimes deſerved.

9
Pyrrhus king of Epirus deceives the Sicilians.

Anarchy now raged throughout the iſland, and every faction was reduced to the neceſſity of calling in the aſſiſtance of foreign powers; among whom Pyrrhus king of Epirus took the lead, and reduced all parties to ſome degree of order and obedience. But ambition ſoon prompted him to invade thoſe rights which he came to defend; he caſt off the maſk, and made Sicily feel under his ſway as heavy a hand as that of its former oppreſſors; but the Sicilians ſoon aſſumed courage and ſtrength enough to drive him out of the iſland.

10
The Mamertini ſurpriſe Meſſina, and are aſſiſted by the Romans;

About this period the Mamertini, whom Mr Swinburne indignantly ſtyles a crew of miſcreants, ſurpriſed Meſſina, and, after a general maſſacre of the citizens, eſtabliſhed a republican form of government. Their commonwealth became ſo troubleſome a neighbour to the Greeks, that Hiero II. who had been raiſed to the chief command at Syracuſe in conſideration of his ſuperior wiſdom and warlike talents, found himſelf neceſſitated to form a league with Carthage, in order to deſtroy this neſt of villains. In their diſtreſs the Mamertini implored the aſſiſtance of Rome, though the ſenate had recently puniſhed with exemplary ſeverity one of their own legions for a ſimilar outrage committed at Rhegium. The virtue of the Romans gave way to the temptation, and the deſire of extending their empire beyond the limits of Italy, caſt a veil over every odious circumſtance attending this alliance. A Roman army croſſed the Faro, relieved Meſſina, defeated the Carthaginians, and humbled Hiero into an ally of the republic.

11
which gives riſe to the firſt Punic war.

Thus began the firſt Punic war, which was carried on for many years in Sicily with various ſucceſs. The genius of Hamilcar Barcas ſupported the African cauſe under numberleſs diſappointments, and the repeated overthrows of his colleagues; at laſt, finding his exertions ineffectual, he adviſed the Carthaginian rulers to purchaſe peace at the price of Sicily. Such a treaty was not likely to be obſerved longer than want of ſtrength ſhould curb the animoſity of the vanquiſhed party: when their vigour was recruited, Hannibal ſon of Hamilcar eaſily perſuaded them to reſume the conteſt, and for 16 years waged war in the heart of the Roman territories. Meanwhile Hiero conducted himſelf with ſo much prudence, that he retained the friendſhip of both parties, and preſerved his portion of Sicily in perfect tranquillity. He died in extreme old age, beloved and reſpected both at home and abroad.

12
The ſecond Punic war ... Hannibal.

His grandſon Hieronymus, forſaking this happy line of politics, and contracting an alliance with Carthage, fell an early victim to the troubles which his own folly had excited. Once more, and for the laſt time, the Syracuſans found themſelves in poſſeſſion of their independence: but the times were no longer ſuited to ſuch a ſyſtem; diſſenſions gained head, and diſtracted the public councils. Carthage could not ſupport them, or prevent Marcellus from undertaking the ſiege of Syracuſe, immortalized by the mechanical efforts of Archimedes, and the immenſity of the plunder. See Syracuse.

13
Sicily conquered by the Saracens, and afterwards by the Normans.

The Sicilians after this relinquiſhed all martial ideas, and during a long ſeries of generations turned their attention ſolely to the arts of peace and the labours of agriculture. Their poſition in the centre of the Roman empire preſerved them both from civil and foreign foes, except in two inſtances of a ſervile war. The rapacity of their governors was a more conſtant and inſupportable evil. In this ſtate of apathy and opulence Sicily remained down to the 7th century of our era, when the Saracens began to diſturb its tranquillity. The barbarous nations of the north had before invaded and ravaged its coaſts, but had not long kept poſſeſſion. The Saracens were more fortunate. In 827 they availed themſelves of quarrels among the Sicilians to ſubdue the country. Palermo was choſen for their capital, and the ſtandard of Mahomet triumphed about 200 years. In 1038 George Maniaces was ſent by the Greek emperor with a great army to attack Sicily. He made good his landing, and puſhed his conqueſts with vigour: his ſucceſs aroſe from the valour of ſome Norman troops, which were at that time unemployed and ready to ſell their ſervices to the beſt bidder. Maniaces repaid them with ingratitude; and by his abſurd conduct gave the Muſſelmans time to breathe, and the Normans a pretext and opportunity of invading the Imperial dominions in Italy. Robert and Roger of Hauteville afterwards conquered Sicily on their own account, not as mercenaries; for having ſubſtantially ſettled their power on the continent, they turned their arms againſt this iſland in obedience to the dictates of zeal and ambition. After ten years ſtruggle, the Saracens yielded up the rich prize, and Robert ceded it to his brother Roger, who aſſumed the title of Great Earl of Sicily, ruled the ſtate with wiſdom, and ranks deſervedly among the greateſt characters in hiſtory. He raiſed himſelf from the humble ſtation of a poor younger ſon of a private gentleman, to the exalted dignity of a powerful monarch, by the ſole force of his own genius and courage; he governed a nation of ſtrangers with vigour and juſtice, and tranſmitted his poſſeſſions undiſputed to his poſterity. Such an aſſemblage of great qualities is well intitled to our admiration.

14
Under the dominion of different monarchs.

He was ſucceeded by his ſon Simon, whoſe reign was ſhort, and made way for a ſecond ſon called Roger. In 1127 this prince joined to his Sicilian poſſeſſions the whole inheritance of Robert Guiſcard (ſee Naples, N° 23), and aſſumed the regal ſtyle. The greateſt part of his reign was taken up in quelling revolts in Italy, but Sicily enjoyed profound peace. In 1154 his ſon William aſcended the throne, and paſſed his life in war and confuſion. William II. ſucceeded his father, and died without iſſue. Tancred, though [illegible], was elected his ſucceſſor, and after him his ſon William III. who was [illegible] by Henry of Suabia. [illegible]

the

Sicily.

the troubles that agitated the reign of his fon the emperor Frederic, peace appears to have been the lot of Sicily. A fhort-lived fedition, and a revolt of the Saracens, are the only commotions of which we read. For greater fecurity, the Saracens were removed to Puglia 400 years after the conqueft of Sicily by their anceftors. Under Conrad and Manfred Sicily remained quiet; and from that time the hiftory of Sicily is related under the article NAPLES, N° 20, &c.

15
Is at length conquered by the Spaniards.

At the death of Charles II. of Spain, his fpoils became an object of furious contention; and at the peace of Utrecht, Sicily was ceded to Victor duke of Savoy, who, not many years after, was forced by the emperor Charles VI. to relinquifh that fine ifland, and take Sardinia as an equivalent. But as the Spaniards had no concern in thefe bargains, they made a fudden attempt to recover Sicily, in which they failed through the vigilance of the Englifh admiral Byng. He deftroyed their fleet in 1718, and compelled them to drop their fcheme for a time. In 1734 the Spanifh court refumed their defign with fuccefs. The infant Don Carlos drove the Germans out, and was crowned king of the two Sicilies at Palermo. When he paffed into Spain to take poffeffion of that crown, he transferred the Sicilian diadem to his fon Ferdinand III. of Sicily, and IV. of Naples, and it has ever fince remained in the poffeffion of the fame family.

16
Account of the ftraits of Meffina.

Sicily is feparated, as we have already obferved, from Italy by a narrow ftrait called the *Faro of Meffina*. This ftrait is ftill remarkable for the rapidity of its currents and the irregular ebbing and flowing of the fea, which fometimes rufhes in with fuch violence as to endanger fhips riding at anchor. Anciently it was much more remarkable for Scylla and Charybdis, the one a rock, and the other a whirlpool, between which it was very dangerous to fteer, and concerning which fo many fables have been related by the ancients. Scylla is a rock on the Italian fide, oppofite to Cape Pylores, which runs out into the fea on the Sicilian fide. Mr Brydone informs us, that the navigation of the ftraits is not even yet performed without danger. He alfo informs us, that the noife of the current which fets through the ftraits may be heard for feveral miles, like the roaring of fome large impetuous river confined between narrow banks. In many places the water rofe into whirlpools and eddies, which are dangerous to fhipping. The current fet exactly for the rock of Scylla, and would certainly have carried any thing thrown into it againft that point. Our author, however, is by no means of opinion that the ftrait is fo dangerous as the ancients have reprefented it; though he thinks that the ftrait is now probably much wider than formerly, which may have diminifhed the danger. There are many fmall rocks, which fhow their heads near the bafe of the large ones. Thefe are probably the dogs defcribed by the ancient poets as howling round Scylla. The rock is near 200 feet high, and has a kind of caftle or fort built on its fummit with a town called *Scylla* or *Sciglio*, containing 300 or 400 inhabitants on its fouth fide, which gives the title of prince to a Calabrefe family.

The following account of thefe rocks and whirlpools is given by the celebrated naturalift Spallanzani. He informs us, that Scylla is a lofty rock, 12 miles from Meffina, rifing almoft perpendicular from the fea on the fhore of Calabria, beyond which is the fmall city of the fame name. Though there was fcarcely any wind, Spallanzani heard, about two miles diftant from the rock, a noife like a confufed barking of dogs, and on a nearer approach he difcovered the caufe. This rock contains a number of caverns, one of the largeft of which is called by the people *Dragara*. The waves, when in the leaft agitated, rufhing into thefe caverns, break, dafh, throw up frothy bubbles, and thus occafion thefe various and multiplied founds. He then perceived with how much truth and refemblance of nature Homer and Virgil, in their perfonifications of Scylla, had pourtrayed this fcene, by defcribing the monfter they drew as lurking in the darknefs of a vaft cavern, furrounded by ravenous barking maftiffs, together with wolves, to increafe the horror.

Though the tide is almoft imperceptible in the open parts of the Mediterranean, it is very ftrong in the ftrait of Meffina, owing to the narrownefs of the channel, and regulated by the periodical elevations and depreffions of the water. Where the current is accompanied by a wind blowing the fame way, veffels have nothing to fear, fince they either do not enter the ftrait, both the wind and ftream oppofing them; or, if both are favourable, enter on full fail, and pafs with fuch rapidity that they feem to fly over the water. When the current runs from fouth to north, and the north wind blows hard at the fame time, the fhip is refifted by the oppofite current, and impelled by two forces in contrary directions, is dafhed on the rock of Scylla, or driven on the neighbouring fands. The current, where it is ftrongeft, does not extend over the whole ftrait, but winds through it in intricate meanders, with the courfe of which the failors ftationed to give ftrangers affiftance are well acquainted, and thus able to guide the fhip in fuch a manner as to avoid it. Should the pilot, however, confiding in his own fkill, neglect fuch affiftance, he would run the moft imminent rifk of being fhipwrecked. In this conflict of the waters, it is ufelefs to throw the line to difcover the depth of the bottom, the violence of the current frequently carrying the lead almoft on the furface of the water. The ftrongeft cables, though fome feet in circumference, break like fmall cords. Every expedient afforded by the art of navigation, is ufelefs here. The only means of avoiding being dafhed againft the rocks, or driven upon the fands in the midft of this perilous conteft of the winds and waves, is to have recourfe to the fkill and courage of the Meffinefe feamen.

Charybdis is diftant from the fhore of Meffina about 750 feet, and is called by the people of the country *Calofaro*, not from the agitation of the waves, but from καλος and φαρος, *beautiful tower*, from the lighthoufe erected near it for the guidance of veffels. When the current fets in from the north, the pilots call it the *defcending rema*, or current; and when it runs from the fouth, the *afcending rema*. The current afcends or defcends at the rifing or fetting of the moon, and continues for fix hours. In the interval between each afcent or defcent, there is a calm which lafts at leaft 15 minutes, but not longer than an hour. Afterwards, at the rifing or fetting of the moon, the current enters from the north, making various angles of incidence with the fhore, and at laft reaches the Calofaro. This delay fometimes continues

Sicily.

continues two hours; sometimes it immediately falls into the Calofaro; and then experience regards it as a certain indication of bad weather.

When Spallanzani observed Charybdis from the shore, it appeared like a group of tumultuous waters, which group as he approached, became more extensive and more agitated. He was carried to the edge, where he stopped some time to make the requisite observations; and was then convinced beyond the shadow of a doubt, that what he saw was by no means a vortex or whirlpool.

Though he was convinced that there was no gulf under the Calofaro, as otherwise there would have been a whirlpool, which would have carried down into it the floating substances; he determined to sound the bottom with a plummet, and found its greatest depth did not exceed 500 feet. He was also informed, to his great surprise, that beyond the Calofaro, towards the middle of the strait, the depth was double.

When the wind and current are contrary to each other, and both in their greatest violence, the swelling and dashing of the waves within the Calofaro is much stronger, more impetuous, and more extensive. It then contains three or four small whirlpools, or even more, according to the greatness of its extent and violence. If at this time small vessels are driven into the Calofaro by the current or the wind, they are seen to whirl round, rock, and plunge, but are never drawn down into the vortex. They only sink when filled with water, by the waves beating over them. When vessels of a larger size are forced into it, whatever wind they have they cannot extricate themselves; their sails are useless; and after having been for some time tossed about by the waves, if they are not assisted by the pilots of the country, who know how to bring them out of the course of the current, they are furiously driven upon the neighbouring shore of the Lanterna, where they are wrecked, and the greater part of their crews perish in the waves.

If a ship be extricated from the fury of Charybdis, and carried by a strong southerly wind along the strait towards the northern entrance, it will indeed pass out safely; but should it meet with a wind in a nearly opposite direction, it would become the sport of both these winds, and, unable to advance or recede, be driven in a middle course between their two directions, that is to say, full upon the rock of Scylla, if it be not immediately assisted by the pilots. It is likewise observed, that in these hurricanes a land wind frequently rises, which descends from a narrow pass in Calabria, and increases the force with which the ship is impelled towards the rock. Thus, the saying which became proverbial among the ancients;—that "he who endeavours to avoid Charybdis, dashes upon Scylla," is, in a great measure, true.

In the straits, Mr Brydone informs us, a most surprising phenomenon is to be observed. In the heat of summer, after the sea and air have been much agitated, there appears in the heavens over the straits a great variety of singular forms, some at rest and others moving with great velocity. These forms, in proportion as the light increases, seem to become more aerial, till at last, some time before sunrise, they totally disappear. The Sicilians represent this as the most beautiful sight in nature. Leonti, one of the best Sicilian writers, says, that the heavens appear crowded with a variety of objects, such as palaces, woods, gardens, &c. besides the figures of men and other animals that are seen in motion among them. Some treatises have been written concerning this phenomenon; but nothing satisfactory has been delivered concerning its cause.

Sicily.

17 Climate and produce.

Watkin's Travels through Switzerland, Italy, Sicily, &c.

Though Sicily lies in a warm climate, the air is healthful, being refreshed with sea-breezes on every side. It has at all times been remarkably fertile; but the era of its greatest prosperity was from the siege of Syracuse by the Athenians to the Carthaginian conquests. Then and long after it supplied with grain, in years of scarcity, all the countries upon the Mediterranean except Egypt and the coasts of Asia, and Rome and Carthage continually. Even now, under all the impediments of superstition and bad government, its productions are, in quantity and quality, the best in Europe. Of the vegetable are grain, wines, oil, fruits, tobacco, mulberry trees for the silkworm, cotton, medicinal roots, and sugar canes. The last of these flourish near Avola and Merilli. They are of an inferior quality to those of the West Indies, but their sugar is sweeter than any other. The animal production is similar to that of Italy, but the horned cattle are a smaller breed. The coasts abound with fish, particularly with tunney and anchovies; the export of which forms a very lucrative branch of commerce. There are mines of silver, copper, and lead, but none are worked. Near Palma are beds of the best sulphur; at the mouth of the river Giaretta is found a yellow amber, preferable to that of the Baltic: and in every part of the island quarries of marbles, that have furnished materials for all the noble edifices of Sicily. The most beautiful are in the neighbourhood of Palermo, particularly the yellow, and those that resemble the verde antique, porphyry, and lapis lazuli. The population of the island amounts to 1,300,000 souls; not as much again as the single city of Syracuse formerly contained.

18 Rivers and mountains.

Here are several rivers and good springs; but few of the rivers are navigable, having but a short course, and descending precipitately from the mountains. The chief are the Bantera, the Jaretta, and the Salso; of which, the two former run from west to east, and the third from north to south.

Of the mountains in this island the most noted is Mount Etna, now called *Monte Gibello*, or *Mongibello*, a volcano whose eruptions have often proved fatal to the neighbouring country. See ETNA.

19 Constitution and government.

Munter's Memoirs relative to Naples and Sicily.

Were the Sicilians a cultivated people, among whom those arts were encouraged which not only promote the wealth and comfort of a nation, but also exercise the nobler faculties and extend the views of mankind, the circumstances of their government are such, that it might gradually be improved into a free constitution: but to this, the ignorance, superstition, and poverty, of the people seem to be invincible obstacles. The monarchical power in Sicily is far from being absolute; and the parliament claims a share of public authority independently of the will of the king, deduced from a compact made between Roger and the Norman barons after the expulsion of the Saracens. This claim is denied by the king, who wishes the nobles to consider their privileges as derived solely from his favour. Hence the government is in a situation which greatly resembles that of our own and the other kingdoms of Europe in the feudal times; there are continual jealousies and oppositions between the king and the barons, of which an enlightened people might easily take advantage, and obtain that share in the constitution which might secure them

them from future oppression. In these disputes, the king has the advantage at least of power if not of right; and several works, in which the claims of the Sicilian barons have been asserted, were publicly burned not many years ago.

As the sovereign holds his court at Naples, Sicily is governed by a viceroy, who is appointed only for three years, though at the end of that term his commission is sometimes renewed. He lives in great state, and, as the representative of the king, his power is very considerable. He presides in all the courts and departments of government, and is commander in chief of all the forces: he calls or dissolves the parliament when he pleases; and by him all orders, laws, and sentences, must be signed: but his office is far from being desirable, as it generally renders him the object either of the jealousy of the court of Naples, or of the hatred of the Sicilians.

The parliament consists of the nobles, the bishops, and abbots, and the representatives of 43 cities, which are immediately subject to the crown. Those cities which are subject to any of the nobles send no members to the parliament; in these the king has not much authority, and derives little advantage from them. According to the laws, the parliament ought to be assembled at the end of every three years: but the government pays little attention to this rule. The common people are in general very much attached to the nobles, and are inclined to take their part in all their differences with the court: but the magistrates and principal inhabitants of the cities which belong to these feudal lords, wish to get rid of their authority, and imagine that they should be less oppressed, if immediately subject to the king: these inclinations are not disagreeable to the court, and are encouraged by most of the lawyers, who are of great service to government in contesting the privileges of the nobles. Many of these privileges are now abridged; and the power of the barons, with respect to the administration of justice in their domains, was very properly limited by the viceroy Caraccioli, in the year 1785. The government of this nobleman was very beneficial to Sicily, as he, in a great measure, cleared the island of the banditti that used to infest it, and made several excellent regulations for the establishment of social order and personal security. He

20 Inquisition. deserves the thanks of every well-wisher to mankind for having abolished the court of inquisition, which had been established in this country by Ferdinand the Catholic, and made dependent on the authority of the grand inquisitor of Spain. Its last *auto da fe* was held in the year 1724, when two persons were burned. At length Charles III. rendered it independent of the Spanish inquisitor, and abridged its power, by forbidding it to make use of the torture, and to inflict public punishments. The Marchese Squillace, and his successor the Marchese Tanucci, were both enemies to the hierarchy; and, during their viceroyalties, took care to appoint sensible and liberal men to the office of inquisitor: the last of whom was Ventimiglia, a man of a most humane and amiable character, who heartily wished for the abolition of this diabolical court, and readily contributed toward it. While he held the office of inquisitor, he always endeavoured to procure the acquittal of the accused; and when he could succeed no other way, would pretend some informality in the trial. The total annihilation of this instrument of the worst of tyranny was reserved for Caraccioli. A priest being accused to the inquisition, was dragged out of his house and thrown into the dungeon. He was condemned; but, on account of informality, and a violation of justice in the trial, he appealed to the viceroy, who appointed a committee of jurists to examine the process. The inquisitor refused to acknowledge the authority of this commission; pretending that to expose the secrets of the holy office, and to submit its decisions to the examination of lay judges, would be so inconsistent with his duty, that he would see the

21 abolished by Caraccioli. inquisition abolished rather than consent to it. Caraccioli took him at his word, and procured a royal mandate by which the holy office was at once annihilated. He assembled all the nobility, judges, and bishops, on the 27th of March 1782, in the palace of the inquisition, and commanded the king's order to be read; after which he took possession of the archives, and caused all the prisons to be set open: in these were at that time only two prisoners, who had been condemned to perpetual confinement for witchcraft. The papers relating to the finances were preserved; but all the rest were publicly burned. The possessions of the holy office were assigned to the use of churches and charitable institutions: but the officers then belonging to it retained their salaries during their lives. The palace itself is converted into a customhouse, and the place where heretics were formerly roasted alive for the honour of the Catholic faith, is now changed into a public garden. The cognizance of offences against orthodoxy is committed to the bishops: but they cannot cite any one to appear before them without permission from the viceroy; neither can they confine any person to a solitary prison, nor deny him the privilege of writing to his friends, and conversing freely with his advocate. The nobility are so numerous in this island, that Labat says it is paved with noblemen. The general assembly of parliament is composed of 66 archbishops, bishops, abbots, and priors, which form the Bracchio ecclesiastico. Fifty-eight princes, 27 dukes, 37 marquisses, 27 counts, one viscount, and 79 barons, form the militaire; and the demaniale consists of 43 representatives of free towns. Out of each bracchio four deputies are chosen to conduct public business. But the viceroy, the prince of Butera, and the prætor of Palermo, are always the three first. Such was the government of Sicily while the Neapolitan monarchy remained entire; but since the latter was usurped by the French, Sicily is all that is left to its former possessor.

SICINIUS DENTATUS, a tribune of the people, lived a little after the expulsion of the kings from Rome. He was in 120 battles and skirmishes, besides single combats, in all of which he came off conqueror. He served under nine generals, all of whom triumphed by his means. In these battles he received 45 wounds in the forepart of his body, and not one in his back. The senate made him great presents, and he was honoured with the name of the Roman Achilles.

SICYOS, a genus of plants belonging to the class of monœcia, and to the order of syngenesia; and in the natural system arranged under the 34th order, *Cucurbitaceæ*. See BOTANY *Index*.

SIDA, *Yellow* or *Indian MALLOW*, a genus of plants belonging to the class of monadelphia, and to the order of polyandria; and in the natural system ranging under the 37th order, *Columniferæ*. See BOTANY *Index*.

SIDDEE, or SEDEE, an Arabic title, by which the Abyssinians or Habashys are always distinguished in the courts of Hindostan; where, being in great repute for firmness and fidelity, they are generally employed as commanders of forts or in posts of great trust.

SIDEREAL YEAR. See *ASTRONOMY Index*.

SIDERIA, in *Natural History*, the old name of a genus of crystals, used to express those altered in their figure by particles of iron. These are of a rhomboidal figure, and composed only of six planes. Of this genus there are four known species. 1. A colourless, pellucid, and thin one; found in considerable quantities among the iron ores of the forest of Dean in Gloucestershire, and in several other places. 2. A dull, thick, and brown one; not uncommon in the same places with the former. And, 3. A black and very glossy kind, a fossil of great beauty; found in the same place with the others, as also in Leicestershire and Sussex.

SIDERITE, a substance supposed by Meyer to be a new metal; but according to Bergman and Kirwan it is nothing else than a natural combination of phosphoric acid with iron.

SIDERITIS, IRONWORT; a genus of plants belonging to the class of didynamia, and to the order of gymnospermia; and in the natural system ranging under the 42d order *Verticillatæ*. See BOTANY *Index*.

SIDEROXYLON, IRON-WOOD; a genus of plants belonging to the class of pentandria, and to the order of monogynia; and in the natural system ranging under the 53d order, *Dumosæ*. See BOTANY *Index*.

SIDNEY, SIR PHILIP, was born, as is supposed, at Penshurst in Kent in the year 1554: His father was Sir Henry Sidney, an Irish gentleman, and his mother Mary the eldest daughter of John Dudley duke of Northumberland. He was sent when very young to Christchurch college at Oxford, but left the university at 17 to set out on his travels. After visiting France, Germany, Hungary, and Italy, he returned to England in 1575, and was next year sent by Queen Elizabeth as her ambassador to Randolph emperor of Germany. On his return he visited Don John of Austria, governor of the Netherlands, by whom he was received with great respect. In 1579, when Queen Elizabeth seemed on the point of concluding her long projected marriage with the duke of Anjou, Sir Philip wrote her a letter, in which he dissuaded her from the match with unusual elegance of expression, as well as force of reasoning. About this time a quarrel with the earl of Oxford occasioned his withdrawing from court; during which retirement he is supposed to have written his celebrated romance called *Arcadia*.

In 1585, after the queen's treaty with the United States, he was made governor of Flushing and master of the horse. Here he distinguished himself so much both by his courage and conduct, that his reputation rose to the highest pitch. He was named, it is pretended, by the republic of Poland as one of the competitors for that crown, and might even have been elected had it not been for the interference of the queen. But his illustrious career was soon terminated; for in 1586 he was wounded at the battle of Zutphen, and carried to Arnheim, where he soon after died. His body was brought to London, and buried in St Paul's cathedral. He is described by the writers of that age as the most perfect model of an accomplished gentleman that could be formed even by the wanton imagination of poetry or fiction. Virtuous conduct, polite conversation, heroic valour, and elegant erudition, all concurred to render him the ornament and delight of the English court: and as the credit which he enjoyed with the queen and the earl of Leicester was wholly employed in the encouragement of genius and literature, his praises have been transmitted with advantage to posterity. No person was so low as not to become an object of his humanity. After the battle of Zutphen, while he was lying on the field mangled with wounds, a bottle of water was brought him to relieve his thirst; but observing a soldier near him in a like miserable condition, he said, *This man's necessity is still greater than mine;* and resigned to him the bottle of water. Besides his *Arcadia*, he wrote several smaller pieces both in prose and verse, which have been published.

SIDNEY, *Algernon*, was the second son of Robert earl of Leicester, and of Dorothy eldest daughter of the earl of Northumberland. He was born about the year 1617. During the civil wars he took part against the king, and distinguished himself as a colonel in the army of the parliament. He was afterwards appointed one of King Charles's judges, but declined appearing in that court. During the usurpation of Cromwel, Sidney, who was a violent republican, retired to the country, and spent his time in writing those discourses on government which have been so deservedly celebrated. After the death of the Protector, he again took part in the public transactions of his country, and was abroad on an embassy to Denmark when King Charles was restored. Upon this he retired to Hamburgh, and afterwards to Francfort, where he resided till 1677, when he returned to England and obtained from the king a pardon. It has been affirmed, but the story deserves no credit, that during his residence abroad King Charles hired ruffians to assassinate him. After his return he made repeated attempts to procure a seat in parliament, but all of them proved unsuccessful. After the intention of the commons to seclude the duke of York from the throne had been defeated by the sudden dissolution of parliament, Sidney joined with eagerness the councils of Russel, Essex, and Monmouth, who had resolved to oppose the duke's succession by force of arms. Frequent meetings were held at London; while, at the same time, a set of subordinate conspirators, who were not, however, admitted into their confidence, met and embraced the most desperate resolutions. Keiling, one of these men, discovered the whole conspiracy; and Algernon Sidney, together with his noble associates, was immediately thrown into prison, and no art was left unattempted in order to involve them in the guilt of the meaner conspirators.

Howard, an abandoned nobleman, without a single spark of virtue or honour, was the only witness against Sidney; but as the law required two, his discourses on government, found unpublished in his closet, were construed into treason, and declared equivalent to another witness. It was in vain for Sidney to plead that papers were no legal evidence; that it could not be proved they were written by him; and that if they were, they contained nothing treasonable. The defence was overruled; he was declared guilty, condemned, and executed! His attainder was reversed in the first year of King William.

He was a man of extraordinary courage; steady even to obstinacy; of a sincere but rough and boisterous temper. Though he professed his belief in the Christian religion, he was an enemy to an established church, and even, according to Burnet, to every kind of public worship. In his principles he was a zealous republican: government was always his favourite study; and his essays on that subject are a proof of the progress which he made.

SIDON, in *Ancient Geography*, a city of Phœnicia in Asia, famous in Scripture for its riches, arising from the extensive commerce carried on by its inhabitants. Heavy judgements were denounced against the Sidonians on account of their wickedness, which were accomplished in the time of Ochus king of Persia: for that monarch having come against them with an army on account of their rebellion, the city was betrayed by its king; upon which the wretched inhabitants were seized with despair; they set fire to their houses, and 40,000, with their wives and children, perished in the flames.

This city is now called *Saide*, and, according to Mr Bruce's account, not only its harbour is filled up with sand, but the pavement of the ancient city stood $7\frac{1}{2}$ feet lower than the ground on which the present city stands. Volney describes it as an ill-built dirty city. Its length along the sea-shore is about 600 paces, and its breadth 150. At the north-west side of the town is the castle, which is built in the sea itself, 80 paces from the main land, to which it is joined by arches. To the west of this castle is a shoal 15 feet high above the sea, and about 200 paces long. The space between this shoal and the castle forms the road, but vessels are not safe there in bad weather. The shoal, which extends along the town, has a bason inclosed by a decayed pier. This was the ancient port; but it is so choked up by sand, that boats alone can enter its mouth near the castle. Fakr-el-din, emir of the Druses, destroyed all these little ports from Bairout to Acre, by sinking boats and stones to prevent the Turkish ships from entering them. The bason of Saide, if it were emptied, might contain 20 or 25 small vessels. On the side of the sea, the town is absolutely without any wall; and that which encloses it on the land side is no better than a prison-wall. The whole artillery does not exceed six cannons, and these are without carriages and gunners. The garrison scarcely amounts to 100 men. The water comes from the river Aoula, through open canals, from which it is fetched by the women. These canals serve also to water the orchards of mulberry and lemon trees.

Saide is a considerable trading town, and is the chief emporium of Damascus and the interior country. The French, who are the only Europeans to be found there, have a consul, and five or six commercial houses. Their exports consist in silks, and particularly in raw and spun cottons. The manufacture of this cotton is the principal art of the inhabitants, the number of whom may be estimated at about 5000. It is 45 miles west from Damascus. E. Long. 36. 5. N. Lat. 37.

SIDUS GEORGIUM, in *Astronomy*, a new primary planet, discovered by Dr Herschell in the year 1781. By most foreign, and even by some British philosophers, it is known by the name of *Herschell*, in honour of the discoverer. As the other planets are distinguished by marks or characters, the planet Herschell is distinguished by an H, the initial letter of the discoverer's name, and a cross to show that it is a Christian planet. See ASTRONOMY *Index*.

SIEGE, in the art of war, is to surround a fortified place with an army, and approach it by passages made in the ground, so as to be covered against the fire of the place.

SIEGEN, a town of Germany in Wetteravia, with a castle and the title of a principality, which it gives to a branch of the house of Nassau. It is seated on a river of the same name, in E. Long. 8. 5. N. Lat. 50. 53.

SIENNA, a large, ancient, and celebrated city of Tuscany in Italy; capital of the Siennese, with an archbishop's see, a famous university, and a citadel. It is about four miles in circumference, and surrounded with an old wall. The metropolitan church is much esteemed by travellers; and though it is a Gothic structure, the architecture is admirable. It is built with black and white marble, and the pavement is of mosaic work. The town is adorned with a great number of palaces, fountains, and superb churches, as also a magnificent hospital. The great area is round, and the houses about it are of the same height, supported by piazzas, under which people may walk in hot or rainy weather; in the middle is a bason, which can be filled with water at any time, to represent a sea-fight with small vessels. The Italian language is taught here with such purity, that a great many foreigners frequent it on that account. It is seated on three eminences, in a fertile soil, in E. Long. 11. 11. N. Lat. 43. 10.

SIENNESE, a duchy in Italy; bounded on the north by the Florentino, on the south by the Mediterranean sea and the duchy of Castro, on the east by the Perugino and Orvietano, and on the west by the Florentino and the Tuscan sea; being about 55 miles in length, and as much in breadth. The soil is pretty fertile, especially in mulberry trees, which feed a great number of silk-worms; and there are several mineral springs. Sienna is the capital town.

SIERRA LEONA, a large country on the west coast of Africa, which some extend from the Grain Coast on the south-east to Cape Verga or Vega on the north-west, i. e. between 7° and 10° N. Lat. Others, however, confine the country between Cape Verga and Cape Tagrin. There runs through it a great river of the same name, of which the source is unknown, but the mouth is in longitude 12. 30. west, lat. 8. 5. north, and is nine miles wide. The climate and soil of this tract of country appear to be, on both sides of the river, among the best in Africa, or at least the most favourable to European constitutions. The heat is much the same as that of the West Indies; but on the higher grounds there is a cool sea breeze, and in the mountainous parts the air is very temperate. According to Lieutenant Matthew, "Sierra Leona, if properly cleared and cultivated, would be equal in salubrity and superior in produce to any of the islands in the West Indies;" and others have affirmed, that "the air is better for a man's health than in many places of Europe." These advantages of climate induced the English to establish a factory at Sierra Leona; but they chose not the most healthful situation. For the benefit of a spring of good water they fixed their residence in a low valley, which is often overspread with mists and noisome vapours, while the air is clear and serene on the summits of the hills, to which water from the well might be easily carried.

Within the district occupied by this colony are the Foulahs, who are in general of a tawny complexion, though many of them are entirely black. They lead a wandering life, and roam about the country with large droves of cows, sheep, goats, and horses. They are much praised by travellers for their hospitality; nor is their humanity in other respects, less commendable; for, if one of their countrymen have the misfortune to fall into slavery, the rest join stock to redeem him. Elephants are so numerous in the country of the Foulahs, that they are frequently seen in droves of 200 together. The people are very dexterous at hunting them, and other wild beasts; from which they derive their principal articles of trade.

The animal productions of Sierra Leona are lions, from which it has its name; leopards, hyænas, musk cats, and many kinds of weasels; the japanzee or chimpanzee, a species of simia, which has a still more striking resemblance to the human figure than even the ouran outang; porcupines, wild hogs, squirrels, and antelopes. Besides these, which are natives of the country, oxen thrive in it, and even grow fat; asses too are employed in labour, and do not suffer by the climate; but sheep suffer much from the heat, change their wool into hair, grow lean and increase very little; while the hardy goat is here as prolific and large as in any other country. Of the birds which frequent the woods of Sierra Leona we can give no perfect account. A species of crane is mentioned as easily tamed; common poultry multiply fast; ducks thrive well, but geese and turkeys seem not to agree with the climate. Turtles of all kinds are very common, and sometimes of a large size. Crocodiles or alligators of a non-descript species have been found ten or twelve feet in length, and lizards of six different species. Snakes, which are almost innumerable, haunt the houses in the night in search of poultry; and one was observed which measured 18 feet, but was happily found not to be venomous. Fishes are in great variety both in the sea and in the rivers. Besides the whale, the shark, stinging ray, and porpoise, there are eels, horse-mackarel, tarpoons, cavillos, mullets, snappers, yellow-tails, old-maids, ten-pounders, and some other fishes; all of which, except the eels and ten-pounders, are esteemed fine eating. Oysters are found in great abundance, and another shell-fish, which the natives eat. Among the zoophytes, none is more worthy of notice than the common sponge, which covers all the sandy beaches of the river, particularly on the Bullom shore, and would fetch a high price in Great Britain.

Of the numerous vegetable productions of Sierra Leona, our limits will permit us only to mention the following. Rice, which is the plant chiefly cultivated, as the natives subsist almost entirely upon it, grows both in the high and low grounds. It prospers indeed best in swamps, though the grain is better in a drier soil. Next to rice the cassada constitutes the chief food of the inhabitants, and is cultivated with great care. The country likewise produces yams, various kinds of potatoes, eddoes, or the *arum esculentum*. Oil-palm, plantains, and bananas; papaw, guava, oranges and limes; pompions, melons, and cucumbers; pine-apples, pigeon-peas, which dressed like English peas are a good pulse; maize or Indian-corn; millet, cocoa-nut trees; ockra; the tallow-tree; a great variety of tamarinds; different kinds of fig-trees and plums; a kind of fruit resembling grapes, but more acid and acrid; cherries resembling a fine nectarine in taste; a species of the bread fruit-tree; the cream fruit, so called because when wounded it yields a fine white juice resembling sugar or the best milk, of which the natives are very fond; the malaguetta pepper, or grains of paradise; a new species of nutmeg, but whether so good as the common sort has not yet been ascertained; a new species of the Peruvian bark, which it is hoped will prove as useful as the other; and cola, a fruit highly esteemed by the natives for the same virtues with that bark; the ricinus, cassia, dye-stuffs, and gums, of great value; cotton, tobacco, and sugar-canes, which, it is thought, would thrive exceedingly well under proper cultivation.

Considering the ardour of the maritime nations of Europe for settling colonies in distant regions of the globe, it is somewhat surprising that a climate so temperate and a soil so productive as that of Sierra Leona did not long ago attract their notice. But it was left to be colonized for a better purpose than that which first drew the natives of Europe to the West Indies and the American continent. Being thinly inhabited, Sierra Leona appeared to some benevolent gentlemen in England a place where, without incommoding the natives, a sufficient quantity of ground might be bought on which to settle a great number of free negroes, who in 1786 swarmed in London in idleness and want. About 400 of these wretches, together with 60 whites, mostly women of bad character and in ill health, were accordingly sent out, at the charge of government, to Sierra Leona. Necessity, it was hoped, would make them industrious and orderly; and Captain Thomson of the navy, who conducted them, obtained, for their use, a grant of land to his majesty from King Tom, the neighbouring chief, and afterwards from Naimbanna, the king of the country. The colony, however, soon went to ruin; but the land which they occupied, being about 20 miles square, his majesty was enabled to grant by act of parliament to another colony founded on better principles and for a still nobler purpose.

The most intelligent members of that society, which laboured so strenuously to procure an abolition of the slave-trade, justly concluding that the natives of Guinea would reap very little benefit from the attainment of their object, unless they should be taught the principles of religion and the arts of civil life, which alone can render them really free, conceived the plan of a colony at Sierra Leona to be settled for the truly generous purpose of civilizing the Africans by maintaining with them a friendly intercourse, and a commerce in every thing but men. This plan could not be carried into effect but at a very great expence. Subscriptions were therefore opened upon rational and equitable terms, and a sum deemed sufficient was speedily raised. An act of parliament was passed in favour of the subscribers, by which they were incorporated by the denomination of the *Sierra Leona Company*; and in pursuance of that act they held their first meeting at London in October 1791.

The directors having stated the natural advantages of Sierra Leona, and its present miserable condition, observed, that they had not merely to establish a commercial

mercial factory, but that, to introduce civilization, cultivation, and a safe trade, the company must provide for the security of the persons and property of the colonists. The directors therefore resolved, that three or four vessels should sail at once, with such a number of people as would be able to protect and assist each other; with goods both for trade and for the supply of the colony. Accordingly several vessels sailed, having on board a council for the government of the colony and the management of the company's affairs; a number of artificers and other servants of the company; some soldiers, and a very few English settlers. The directors were laudably cautious in the choice of colonists. They admitted into the society no white man of bad character, or who was not a declared enemy to the slave-trade; and as the chief object of their enterprise was the civilization of the natives, it was with great propriety that they chose more than three-fourths of their settlers from the free negroes in Nova Scotia, who had borne arms for the British government during the American war. The superintendant and council were particularly instructed to secure to all blacks and people of colour, at Sierra Leona, equal rights and equal treatment, in all respects, with whites. They were to be tried by jury, as well as others; and the council was desired to allot to the blacks employments suited to their present abilities, and to afford them every opportunity of cultivating their talents. All practicable means of maintaining subordination were directed to be used; and the council was especially instructed to promote religion and morals, by supporting public worship and the due observance of the Sabbath, and by the instruction of the people, and the education of children. But no person was to be prevented from performing or attending religious worship in whatever place, time, or manner, he might think fit, or from peaceably inculcating his own religious opinions. Orders were given in choosing the scite of a town, to consider health as the first object; and the first town was directed to be called *Free-Town*. Articles for building and cultivation were sent out, besides the cargoes for prosecuting the company's commerce; and schools for reading, writing, and accounts, were ordered to be set up for the purpose of instructing the children of such natives as should be willing to put them under the company's care.

The leading object of the company was to substitute, for that disgraceful traffic which has too long subsisted, a fair commerce with Africa, and all the blessings which might be expected to attend it. Considerable advantages appeared hereby likely to result to Great Britain, not only from our obtaining several commodities cheaper, but also for opening a market for British manufactures, to the increasing demands of which it is difficult to assign a limit. From this connection, Africa was likely to derive the still more important benefits of religion, morality, and civilization. To accomplish these purposes, it was necessary for the company to possess a tract of land, as a repository for their goods, and which the Africans might cultivate in peace, secure from the ravages of the slave-trade. It had been ascertained, beyond a doubt, that the climate and soil of Africa were admirably suited to the growth of sugar, spices, coffee, cotton, indigo, rice, and every other species of tropical produce. The company proposed to instruct the natives to raise these articles, and to set them the example, by a spirited cultivation, on its own account. Directions were given to the company's commercial agent to push forward a trade, in a mode prescribed, in the present produce of Africa. Measures were taken for cultivating, on the company's account, the most profitable tropical produce; and in particular, a person of long experience in the West Indies was ordered to begin a sugar plantation. A mineralogist and botanist were likewise engaged to go out and explore the country for new articles of commerce.

Every thing being thus settled upon the most equitable and benevolent principles, the ships sailed with the British colonists, to whom, in March 1792, were added 1131 blacks from Nova Scotia. The native chiefs being reconciled to the plan, and made to understand its beneficent tendency towards their people, the colony proceeded to build *Free-Town*, on a dry and rather elevated spot on the south side of the river. It occupied between 70 and 80 acres, its length being about one-third of a mile, and its breadth nearly the same; and it contained near 400 houses, each having one-twelfth of an acre annexed, on which a few vegetables were raised. There were nine streets running from north-west to south-east, and three cross streets, all 80 feet wide, except one of 160 feet, in the middle of which were all the public buildings. These consisted of a governor's house and offices; a large store-house; a large hospital; six or eight other houses, offices, and shops, occupied by the company's servants; and a church capable of containing 800 people. The colonists at first suffered much from the rainy season, against which it was not in their power to provide sufficient protection; but at the end of it they recovered in a great measure their health and spirits, and proceeded with alacrity to execute the various purposes of their settlement. To excite emulation in culture, the government gave premiums to those colonists who raised the greatest quantities of rice, yams, eddoes, cabbages, Indian corn, and cotton, respectively. To limit the excesses of the slave-trade, and gain the favour of the neighbouring chiefs, the directors instructed the governor and council to redeem any native from the neighbourhood, who should be unjustly sold either to or by a British subject. The servants of the company conducted themselves with the utmost propriety, being sober, moral, and exemplary; and from the labours of the clergymen were derived services highly important in every point of view. Before the end of two years from the institution of the colony, order and industry had begun to show their effects in an increasing prosperity. The woods had been cut down to the distance of about three English miles all round the town. By these means the climate had become healthier, and sickness had diminished. The fame of the colony spread not only along the whole western coast of Africa, but also to parts far distant from the coast; embassies had been received of the most friendly nature from kings and princes several hundred miles distant; and the native chiefs had begun to send their children to the colony, with full confidence, to be taught reading, writing, and accounts, and to be brought up in the Christian religion. In a word, it was not without grounds that the directors looked forward to that joyful period when, by the influence of the company's measures, the continent of Africa should be rescued from her present state of darkness and misery, and exhibit a delightful scene of light

 and

Sierra. and knowledge of civilization and order, of peaceful induſtry and domeſtic comfort. On their beneficent exertions they hoped with confidence for the bleſſing of Providence; they were countenanced and ſupported by the Britiſh government; and upon the breaking out of the preſent war, the French Convention authoriſed one of their agents to write to the directors, requeſting a full account of the deſign of the inſtitution, and the names of the ſhips employed in their ſervice, and aſſuring them of the good wiſhes of the French government to ſo noble an undertaking. How completely that government fulfilled its promiſe is very generally known. Having vindicated the rights of man in Europe by the violation of every principle of truth and juſtice, they determined by the ſame means to give light and liberty to the Africans; and that they have fully carried their determination into effect will be ſeen by the following extract of a letter from Mr Afzelius, the company's botaniſt, dated Sierra Leona, 15th November 1794. "The French have been here and have ruined us. They arrived on the 28th of September laſt, early in the morning, with a fleet conſiſting of one large ſhip, two frigates, two armed brigs, and one cutter, together with two large armed merchant ſhips, taken by them at the Iſles de Loſs, an Engliſh ſlave factory to the north of our colony, and which they have alſo deſtroyed and burnt. So well had they concealed their nation, that we took them at firſt for Engliſh. They had Engliſh-built veſſels, which were rigged in the Engliſh way. They ſhowed the Engliſh flag, and had their ſailors, at leaſt thoſe we ſaw on deck, dreſſed like Engliſh. In ſhort, we did not perceive our miſtake till we obſerved them pointing their guns. We had not ſtrength ſufficient to reſiſt, and therefore our governor gave orders, that as ſoon as they ſhould begin to fire, the Britiſh flag ſhould be ſtruck, and a flag of truce hoiſted. Accordingly this was done, but ſtill they continued firing, and did much damage, both within and without the town. They killed two people and wounded three or four. But as we did not underſtand the meaning of this proceeding, we aſked them for an explanation; and they anſwered us, that we ſhould diſplay the flag of liberty, as a proof of our ſubmiſſion. We aſſured them that it ſhould already have been done, if we had had any, which terminated the hoſtilities from the ſhips. In the mean time, moſt of the inhabitants had fled from the town, having taken with them as much of their property as they conveniently could in ſuch a hurry. I was with the governor, together with a number of others; but as ſoon as I was certain they were enemies, I went towards my own houſe with a view to ſave as much as poſſible of my property and natural collections; but was received in ſuch a manner, that I could not venture to proceed. My houſe was ſituated near the ſhore, and unfortunately juſt oppoſite the frigate which fired. I ſaw the balls paſſing through the houſe, and heard them whizzing about my ears. I ſaw that I ſhould loſe all my property; but life was dearer to me, and I haſtened to the woods.

Wadſtrom, part ii. p. 250.

"In the afternoon the enemy landed, finding the town almoſt deſtitute of people, but rich in proviſions, clothing and other ſtores. They began immediately to break open the houſes and to plunder. What they did not want, they deſtroyed, burnt, or threw into the river. They killed all the cattle and animals they found in the fields or ſtreets, yards or elſewhere, not ſparing even aſſes, dogs, and cats. Theſe proceedings they continued the whole ſucceeding week, till they had entirely ruined our beautiful and proſpering colony; and when they found nothing more worth plundering, they ſet fire to the public buildings and all the houſes belonging to the Europeans; and burnt, as they ſaid, by miſtake nine or ten houſes of the coloniſts. In the mean time, they were not leſs active on the water. They ſent three of their veſſels to Bance iſland, an Engliſh ſlave factory higher up the river, which they plundered and burnt, together with ſome ſlave ſhips lying there. They took beſides about 10 or 12 prizes, including the company's veſſels. Moſt of theſe they unloaded and burnt. They took along with them alſo two of our armed veſſels, one of which was a large ſhip, laden with proviſions, and which had been long expected; but ſhe unfortunately arrived a few days too ſoon, and was taken with her whole cargo. We expected at leaſt to receive our private letters, but even this was refuſed, and they were thrown overboard. At laſt, after inflicting on us every hardſhip we could ſuffer, only ſparing our lives and the houſes of the coloniſts, they ſailed on the 13th of October laſt, at noon, proceeding downwards to the Gold Coaſt, and left us in the moſt dreadful ſituation, without proviſions, medicines, clothes, houſes, or furniture, &c. &c. and I fear much, that moſt of us ſhould have periſhed, had not our friends in the neighbourhood, both natives and Europeans, who were ſo happy as to eſcape the enemy, been ſo kind as to ſend us what they could ſpare. In the mean time, moſt of us have either been, or ſtill are, very ſick, and many have died for want of proper food and medicine. The worſt, however, is now paſt. At leaſt we are not in any want of proviſion, although of the coarſeſt kind, but are deſtitute of the moſt neceſſary articles and utenſils for the houſe, the table, and the kitchen."

It was thus that the Convention executed their purpoſe of *ſpreading light and liberty through the world*. The Sierra Leona colony was eſtabliſhed for no other end than to aboliſh the ſlave-trade, to enlighten the Africans, and to render them virtuous, rational, free, and happy; and thoſe powerful patrons of the rights of man deſtroyed that colony with many circumſtances of the moſt wanton cruelty. Though Mr Afzelius is a Swede, and ought therefore to have been protected by the laws of neutrality, they burnt his houſe with the reſt; deprived him of his trunks, his clothes, and his bed; deſtroyed the natural curioſities which he had collected at the hazard of his life; and carried away the inſtruments by means of which only he could collect more.

In 1798, Free-Town, conſiſted of about 300 houſes, and a number of public buildings, together with three wharfs. The government-houſe, ſo ſituated as to command the town and harbour, was protected by a paliſade, and ſix pieces of cannon. The inhabitants of this colony were then computed at 1200, of whom 15 were ſhopkeepers, 25 fiſhermen, 10 trading ſhipmaſters, owners of ſmall veſſels, 15 ſeamen, 20 labourers employed by the company, 4 ſchoolmaſters; about one half of the whole population petty farmers, and the reſt mechanics. The number of Europeans reſident at that time in the colony

was

was about 30, and nearly 400 free natives wrought as labourers for wages, on the farms in the colony.

A charter of juſtice was obtained in 1800, to controul the turbulence of the blacks from Nova Scotia, and a ſmall military force from Goree was ſtationed at Sierra Leona. Parliament allowed the company 7000l. for the purpoſe of erecting a fort, with a promiſe of 8000l. more for the ſame undertaking. The company alſo received 10,000l. for their expence in ſettling the blacks from Nova Scotia, and a vote of parliament agreed to pay 4000l. for ſupporting the civil government of the colony.

The Maroons arrived in Sierra Leona in the month of October 1800, and greatly aſſiſted in ſuppreſſing an inſurrection of the Nova Scotia blacks, who had attempted to ſeize on the government of the colony. A body of natives of the Timmaney, headed by two of the fugitive blacks, made an attack on the unfiniſhed fort on the 18th of November, about day-break, but they were repulſed with loſs. A truce was concluded; but it was ſuppoſed that the Timmanee chiefs would make uſe of this interval to form alliances with the natives againſt the Britiſh, in order to exterminate them from this part of Africa. Soldiers to the amount of 65 were brought from Goree, and a ſhip of war was ſtationed in the river, to defend the ſettlement.

In 1802, parliament again voted 10,000l. to the company, for the annual expence of the ſettlement; and in February 1803, the directors were informed by Lord Hobart, that it would be for the intereſt of the colony to transfer the civil and military power from the company to the Britiſh government.

When Captain Hallowell arrived at Sierra Leona on the 12th of January 1803, he found the colony in a wretched condition, reporting to government on his return, that the Maroons were not ſatisfied with their condition, regarding it as one in which they could not find ſubſiſtence; that proviſions of every deſcription were both ſcarce and dear; that its inhabitants lived in hourly danger from the natives; and that the whole coloniſts lived in a ſtate of deſpondency. Government, however, was afterwards ſatisfied, from the explanations of the directors and their ſervants, that the account of Captain Hallowell was by much too unfavourable. Expectations are indulged that, ſince the entire abolition of the ſlave-trade, the colony will ſoon obtain a flouriſhing trade with the natives, in the exchange of Britiſh manufactures for the raw produce of the interior parts of Africa.

A committee of the houſe of commons has had a moſt ſatisfactory proof of the progreſſive improvement of the internal adminiſtration of the colony, ariſing from the additional powers conferred on the company by the charter of juſtice, and the increaſed vigilance and exertion of the Company's ſervants. The Maroons have, in a great meaſure, abandoned ſome pernicious habits they had long indulged, and by their attachment to the colony, and peaceable demeanour, have merited the approbation of government. The progreſs made in the erection of works has been conſiderable, and the colony may be regarded in a ſtate of ſufficient ſecurity againſt the attack of any native power. A body of volunteers has been raiſed within the colony, whoſe fidelity and attachment have been tried by experience. The ſickneſs and mortality which for ſome time exiſted, have in a great degree ſubſided; and there is reaſon to believe, that it rather originated with the troops when they entered the colony, and their habits of intemperance, than from any diſorder connected with their reſidence in that ſituation. The number of births, which has for ſome time exceeded that of the deaths in the colony, is a ſatisfactory proof that it is not unfriendly to population.

Sierra Leona is already rendered ſecure againſt the only enemies whoſe hoſtilities it has immediately to apprehend; its reſources are increaſed; its cultivation reviving; and it is in the poſſeſſion of every advantage that can ariſe from the enjoyment of internal tranquillity and order. It is ſufficiently manifeſt, from the inconveniences already experienced in the colony, that during its continuance, it will be eſſentially neceſſary to ſupport a local government capable of maintaining order among its inhabitants, and affording them protection. The expence of the civil eſtabliſhment for ſome years to come cannot be eſtimated at leſs than 10,000l. per annum *; that of completing the propoſed works has been eſtimated at 8000l. It alſo appears that the defence of the colony will require the preſent volunteer force to be permanently kept up, the expence of which has been eſtimated at 4000l. per annum; or if that eſtabliſhment ſhould be diſcontinued, a regular garriſon muſt be maintained at the conſtant eſtabliſhment of 100 effective men, excluſive of about 20 artillery men, which, conſidering the numerous caſualties in that climate, and great expence of ſupporting them, would exceed the ſum already mentioned.

* *The expence of the civil eſtabliſhment for* 1809 *exceeded* 17,000l.

SIERRA MORENA, a conſiderable ridge of mountains of Andaluſia in Spain. See SPAIN.

SIEUR, a title of reſpect among the French, like that of *maſter* among us. It is much uſed by lawyers, as alſo by ſuperiors in their letters to inferiors.

SIFANTO, or SIPHANTO, an iſland of the Archipelago, to the weſt of Paros, to the north-eaſt of Milo, and to the ſouth-weſt of Serphanto. The air is ſo good here, that many of the inhabitants live to the age of 120; and their water, fruits, wild fowl, and poultry, are excellent, but more eſpecially the grapes. It abounds with marble and granite, and is one of the moſt fertile and beſt cultivated of theſe iſlands. The inhabitants employ themſelves in cultivating olive-trees and capers; and they have very good ſilk. They trade in figs, onions, wax, honey, and ſtraw-hats; and may be about 8000 in all. E. Long. 25. 15. N. Lat. 37. 9.

SI-FANS, or TOU-FANS, a people inhabiting the country on the weſt of China. Their country is only a continued ridge of mountains, incloſed by the rivers Hoang-ho on the north, Ya-long on the weſt, and Yang-tſe-kiang on the eaſt, between the 30th and 35th degrees of north latitude.

Groſier's General Deſcription of China, vol. i. p. 203.

The Si-fans are divided into two kinds of people; the one are called by the Chineſe *Black Si-fans*, the other *Yellow;* names which are given them from the different colours of their tents. The black are the moſt clowniſh and wretched; they live in ſmall bodies, and are governed by petty chiefs, who all depend upon a greater.

The yellow Si-fans are ſubject to families, the oldeſt of which becomes a lama, and aſſumes the yellow dreſs. Theſe lama princes, who command in their reſpective diſtricts, have the power of trying cauſes, and puniſhing criminals; but their government is by no means burdenfome; provided certain honours are paid them, and they receive punctually the dues of the god Fo, which amount to very little, they moleft none of their fubjects. The greater part of the Si-fans live in tents; but fome of them have houfes built of earth, and even brick. Their habitations are not contiguous; they form at moft but fome fmall hamlets, confifting of five or fix families. They feed a great number of flocks, and are in no want of any of the neceffaries of life. The principal article of their trade is rhubarb, which their country produces in great abundance. Their horfes are fmall; but they are well fhaped, lively and robuft.

Thefe people are of a proud and independent fpirit, and acknowledge with reluctance the fuperiority of the Chinefe government, to which they have been fubjected: when they are fummoned by the mandarins, they rarely appear; but the government, for political reafons, winks at this contempt, and endeavours to keep thefe intractable fubjects under by mildnefs and moderation: it would, befides, be difficult to employ rigorous means in order to reduce them to perfect obedience; their wild and frightful mountains (the tops of which are always covered with fnow, even in the month of July) would afford them places of fhelter, from which they could never be driven by force.

The cuftoms of thefe mountaineers are totally different from thofe of the Chinefe. It is, for example, an act of great politenefs among them to prefent a white handkerchief of taffety or linen, when they accoft any perfon whom they are defirous of honouring. All their religion confifts in their adoration of the god Fo, to whom they have a fingular attachment; their fuperftitious veneration extends even to his minifters, on whom they have confidered it as their duty to confer fupreme power and the government of the nation.

SIGAULTIAN OPERATION, a method of delivery in cafes of difficult labour, firft practifed by M. Sigault. It confifts in enlarging the dimenfions of the pelvis, in order to procure a fafe paffage to the child without injuring the mother.

SIGESBECKIA, a genus of plants belonging to the clafs of fyngenefia, and to the order of polygamia fuperflua; and in the natural fyftem ranging under the 49th order, *Compofitæ*. See BOTANY *Index*.

SIGETH, a town of Lower Hungary, and capital of a county of the fame name. It is feated in a morafs, and has a triple wall, with ditches full of water; and is defended by a citadel, being one of the ftrongeft places in Hungary. It now belongs to the houfe of Auftria, and was retaken from the Turks in 1669, after it had been blocked up two years. In fome maps it is called *Zigat*. E. Long. 18. 58. N. Lat. 46. 17.

SIGHING, an effort of nature, by which the lungs are put into greater motion, and more dilated, fo that the blood paffes more freely, and in greater quantity, to the left auricle, and thence to the ventricle. Hence we learn, fays Dr Hales, how fighing increafes the force of the blood, and confequently proportionably cheers and relieves nature, when oppreffed by its too flow motion, which is the cafe of thofe who are dejected and fad.

SIGHT, or VISION. See ANATOMY, N° 142. and *Index* fubjoined to OPTICS.

Imperfection of SIGHT with regard to Colours. Under the article COLOURS, is given an inftance of a ftrange deficiency of fight in fome people, who could not diftinguifh between the different colours. In the Phil. Tranf. vol. lxviii. p. 611. we have an account of a gentleman who could not diftinguifh a claret colour from black. Thefe imperfections are totally unaccountable from any thing we yet know concerning the nature of this fenfe.

Second SIGHT. See *SECOND Sight*.

SIGN, in general, the mark or character of fomething abfent or invifible. See CHARACTER.

Among phyficians, the term *fign* denotes fome appearance in the human body which ferves to indicate or point out the condition of the patient with regard to health or difeafe.

SIGN, in *Algebra*. See ALGEBRA.

SIGN, in *Aftronomy*, a conftellation containing a 12th part of the zodiac. See ASTRONOMY *Index*.

NAVAL SIGNALS. When we read at our firefide the account of an engagement, or other interefting operation of an army, our attention is generally fo much engaged by the refults, that we give but little to the movements which led to them, and produced them; and we feldom form to ourfelves any diftinct notion of the conduct of the day. But a profeffional man, or one accuftomed to reflection, and who is not fatisfied with the mere indulgence of eager curiofity, follows every regiment in its movements, endeavours to fee their connection, and the influence which they have had on the fate of the day, and even to form to himfelf a general notion of the whole fcene of action, at its different interefting periods. He looks with the eye of the general, and fees his orders fucceed or fail.

But few trouble themfelves farther about the narration. The movement is ordered; it is performed; and the fortune of the day is determined. Few think how all this is brought about; and when they are told that during the whole of the battle of Cuftrin, Frederic the Great was in the upper room of a country inn, from whence he could view the whole field, while his aids de camp, on horfeback, waited his orders in the yard below, they are ftruck with wonder, and can hardly conceive how it can be done: but, on reflection, they fee the poffibility of the thing. Their imagination accompanies the meffenger from the inn yard to the fcene of action; they hear the general's orders delivered, and they expect its execution.

But when we think for a moment on the fituation of the commander of a fleet, confined on board one fhip, and this fhip as much, or more clofely, engaged, than any other of the fleet; and when we reflect that here are no meffengers ready to carry his orders to fhips of the fquadron at the diftance of miles from him, and to deliver them with precifion and diftinctnefs, and that even if this were poffible by fending fmall fhips or boats, the viciffitudes of wind and weather may render the communication fo tedious that the favourable moment may be irretrievably loft before the order can be conveyed.—When we think of all thefe circumftances, our thoughts are bewildered, and we are ready to imagine that a fea-battle is nothing but the unconnected ftruggle of individual fhips; and that when the admiral has once "cried havoc, and let flip the dogs of war," he

Naval Signals.

1 Signals a language to the eye.

he has done all that his fituation empowers him to do, and he muft leave the fate of the day to the bravery and fkill of his captains and failors.

Yet it is in this fituation, apparently the moft unfavourable, that the orders of the commander can be conveyed, with a difpatch that is not attainable in the operations of a land army. The fcene of action is unincumbered, fo that the eye of the general can behold the whole without interruption. The movements which it is poffible to execute are few, and they are precife. A few words are fufficient to order them, and then the mere fighting the fhips muft always be left to their refpective commanders. This fimplicity in the duty to be performed has enabled us to frame a language fully adequate to the bufinefs in hand, by which a correfpondence can be kept up as far as the eye can fee. This is the language of SIGNALS, a language by writing, addreffed to the eye, and which he that runneth may read. As in common writing certain arbitrary marks are agreed on to exprefs certain founds ufed in fpeech, or rather, as in hieroglyphics certain arbitrary marks are agreed on to exprefs certain thoughts, or the fubjects of thefe thoughts; fo here certain exhibitions are made, which are agreed on to exprefs certain movements to be executed by the commander to whom they are addreffed, and all are enjoined to keep their eyes fixed on the fhip of the conductor of the fleet, that they may learn his will.

2 Ufed in ancient times,

It is fcarcely poffible for any number of fhips to act in concert, without fome fuch mode of communication between the general and the commanders of private fhips. We have no direct information of this circumftance in the naval tactics of the ancient nations, the Greeks and Romans; yet the neceffity of the thing is fo apparent, that we cannot fuppofe it to have been omitted by the moft ingenious and the moft cultivated people who have appeared on the great theatre of the world: and we are perfuaded that Themiftocles, Conon, and other renowned fea commanders of Athens, had fignals by which they directed the movements of their fleets. We read, that when Ægeus fent his fon Thefeus to Crete, it was agreed on, that if the fhip fhould bring the young prince back in fafety, a white flag fhould be difplayed. But thofe on board, in their joy for revifiting their country after their perilous voyage, forgot to hoift the concerted fignal. The anxious father was every day expecting the fhip which fhould bring back his darling fon, and had gone to the fhore to look out for her. He faw her, but without the fignal agreed on. On which the old man threw himfelf into the fea. We find, too, in the hiftory of the Punic wars by Polybius, frequent allufions to fuch a mode of communication; and Ammianus Marcellinus fpeaks of the *fpeculatores* and *vexillarii*, who were on board the fhips in the Adriatic. The coins both of Greece and Rome exhibit both flags and ftreamers. In fhort, we cannot doubt of the ancients having practifed this hieroglyphical language. It is fomewhat furprifing that Lord Dudley, in his *Arcano del Mare*, in which he makes an oftentatious difplay of his knowledge of every thing connected with the fea fervice, makes no exprefs mention of this very effential piece of knowledge, although he muft, by his long refidence in Italy, have known the marine difcipline of the Venetians and Genoefe, the greateft maritime powers then in Europe.

In the naval occurrences of modern Europe, mention is frequently made of fignals. Indeed, as we have already obferved, it feems impoffible for a number of fhips to act in any kind of concert, without fome method of communication. Numberlefs fituations muft occur, when it would be impoffible to convey orders or information by meffengers from one fhip to another, and coaft and alarm fignals had long been practifed by every nation. The idea, therefore, was familiar. We find, in particular, that Queen Elizabeth, on occafion of the expedition to Cadiz, ordered her fecretaries to draw up inftructions, which were to be communicated to the admiral, the general, and the five counfellors of war, and by them to be copied and tranfmitted to the feveral fhips of the navy, not to be opened till they fhould arrive in a certain latitude. It was on this occafion (fays our hiftorian Guthrie,) "that we meet with the firft regular fets of fignals and orders to the commanders of the Englifh fleet." But, till the movements of a fleet have attained fome fort of uniformity, regulated and connected by fome principles of propriety, and agreed on by perfons in the habit of directing a number of fhips, we may with confidence affirm that fignals would be nothing but a parcel of arbitrary marks, appropriated to particular pieces of naval fervice, fuch as attacking the enemy, landing the foldiers, &c.; and that they would be confidered merely as referring to the final refult, but by no means pointing out the mode of execution, or directing the movements which were neceffary for performing it.

3 as well as in modern;

4 but firft formed into a fyftem by James II. when duke of York.

It was James II. when duke of York, who firft confidered this practice as capable of being reduced into a fyftem, and who faw the importance of fuch a compofition. He, as well as the king his brother, had always fhowed a great predilection for the fea fervice; and, when appointed admiral of England, he turned his whole attention to its improvement. He had ftudied the art of war under Turenne, not as a paftime, but as a fcience, and was a favourite pupil of that moft accomplifhed general. Turenne one day pointed him out, faying, "Behold one who will be one of the firft princes and greateft generals of Europe." When admiral of England, he endeavoured to introduce into the maritime fervice all thofe principles of concert and arrangement which made a number of individual regiments and fquadrons compofe a great army. When he commanded in the Dutch war, he found a fleet to be little better than a collection of fhips, on board of each of which the commander and his fhip's company did their beft to annoy the enemy, but with very little dependence on each other, or on the orders of the general: and in the different actions which the Englifh fleet had with the Dutch, every thing was confufion as foon as the battle began. It is remarkable that the famous penfionary De Witt, who from a ftatefman became a navigator and a great fea commander in a few weeks, made the fame reprefentation to the States General on his return from his firft campaign.

In the memoirs of James II. written by himfelf, we have the following paffage: "1665. On the 15th of March, the duke of York went to Gunfleet, the general rendezvous of the fleet, and haftened their equipment. He ordered all the flag officers on board with him every morning, to agree on the order of battle and rank. In former battles, no order was kept, and this

under

under the duke of York, was the firſt in which fighting in a line and regular form of battle was obſerved."

This muſt be conſidered as full authority for giving the duke of York the honour of the invention. For whatever faults may be laid to the charge of this unfortunate prince, his word and honour ſtand unimpeached. And we are anxious to vindicate his claim to it, becauſe our neighbours the French, as uſual, would take the merit of this invention, and of the whole of naval tactics, to themſelves. True it is, that Colbert, the great and juſtly celebrated miniſter of Louis XIV. created a navy for his ambitious and vain-glorious maſter, and gave it a conſtitution which may be a model for other nations to copy. By his encouragement, men of the greateſt ſcientific eminence were engaged to contribute to its improvement: and they gave us the firſt treatiſes of naval evolutions. But it muſt ever be remembered, that our accompliſhed, though miſguided ſovereign, was then reſiding at the court of Louis; that he had formerly acted in concert with the French as a commander and flag officer, and was at this very time aiding them with his knowledge of ſea affairs. In the memorable day at La Hogue, the gallant Ruſſel, obſerving one of Tourville's movements, exclaimed, "There! they have got Pepys * among them." This anecdote we give on the authority of a friend, who heard an old and reſpectable officer (Admiral Clinton) ſay, that he had it from a gentleman who was in the action, and heard the words ſpoken; and we truſt that our readers will not be diſpleaſed at having this matter of general opinion eſtabliſhed on ſome good grounds.

* Pepys was ſecretary to the duke of York.

5 Wonderful ſimplicity of his ſyſtem;

It was on this occaſion, then, that the duke of York made the movements and evolutions of a fleet the object of his particular ſtudy, reduced them to a ſyſtem, and compoſed that "Syſtem of Sailing and Fighting Inſtructions," which has ever ſince been conſidered as the code of diſcipline for the Britiſh navy, and which has been adopted by our rivals and neighbours as the foundation of their naval tactics. It does great honour to its author, although its merit will not appear very eminent to a careleſs ſurveyor, on account of that very ſimplicity which conſtitutes its chief excellence. It is unqueſtionably the reſult of much ſagacious reflection and painful combination of innumerable circumſtances, all of which have their influence; and it is remarkable, that although ſucceeding commanders have improved the ſubject by ſeveral ſubordinate additions, no change has to this day been made in its general principles or maxims of evolution.

Till ſome ſuch code be eſtabliſhed, it is evident that ſignals can be nothing but arbitrary and unconnected hieroglyphics, to be learned by rote, and retained by memory, without any exerciſe of the judgement; and the acquiſition of this branch of nautical ſkill muſt be a more irkſome taſk than that of learning the Chineſe writing. But ſuch a code being once ſettled, the character in which it may be expreſſed becomes a matter of rational diſcuſſion.

Accordingly, the ſailing and fighting inſtructions of the duke of York were accompanied by a ſet of ſignals for directing the chief or moſt frequent movements of the fleet. Theſe alſo were contrived with ſo much judgement, and ſuch attention to diſtinctneſs, ſimplicity, and propriety, that there has hardly been any change found neceſſary; and they are ſtill retained in the Britiſh navy as the uſual ſignals in all caſes when we are not anxious to conceal our movements from an enemy.

6 yet as an art has ſince his time received conſiderable improvements.

Notwithſtanding this acknowledged merit of the duke of York's ſignals, it muſt be admitted that great improvements have been made on this ſubject, conſidered as an art. The art military has, in the courſe of a century paſt, become almoſt an appropriate calling, and has therefore been made the peculiar ſtudy of its profeſſors. Our rivals the French were ſooner, and more formally placed in this ſituation; and the miniſters of Louis XIV. took infinite and moſt judicious pains to make their military men ſuperior to all others by their academical education. A more ſcientific turn was given to their education, and the aſſiſtance of ſcientific men was liberally given them; and all the nations of Europe muſt acknowledge ſome obligations to them for information on every thing connected with the art of war. They have attended very much to this ſubject, have greatly improved it, and have even introduced a new principle into the art; and by this means have reduced it to the moſt ſimple form of reference to the code of ſailing and fighting inſtructions, by making the ſignals immediately expreſſive, not of orders, but of ſimple numbers. Theſe numbers being prefixed to the various articles of the code of inſtructions, the officer who ſees a ſignal thrown out by the admiral reads the number, and reports it to his captain, perhaps without knowing to what it relates. Thus ſimplicity and ſecrecy, with an unlimited power of variation, are combined. We believe that M. de la Bourdonnais, a brave and intelligent officer, during the war 1758, was the author of this ingenious thought.

We do not propoſe to give a ſyſtem of Britiſh ſignals. This would evidently be improper. But we ſhall ſhow our readers the practicability of this curious language, the extent to which it may be carried, and the methods which may be practiſed in accompliſhing this purpoſe. This may make it an object of attention to ſcientific men, who can improve it; and the young officer will not only be able to read the orders of the commander in chief, but will not be at a loſs, ſhould circumſtances place him in a ſituation where he muſt iſſue orders to others.

Signals may be divided into,

I. Day Signals.

II. Night Signals; and,

III. Signals in a Fog.

They muſt alſo be diſtinguiſhed into, 1. Signals of Evolution, addreſſed to the whole Fleet, or to Squadrons of the fleet, or to Divisions of theſe ſquadrons. 2. Signals of Movements to be made by particular ſhips; and, 3. Signals of Service, which may be either general or particular.

7 During an engagement the ſignals of the admiral are repeated by frigates ſtationed out of the line.

The great extent of a large fleet, the ſmoke in time of battle, and the ſituation of the commander in chief, who is commonly in the midſt of the greateſt confuſion and hotteſt fire, frequently makes it very difficult for the officers of diſtant ſhips to perceive his ſignals with diſtinctneſs. Frigates, therefore, are ſtationed out of the line, to windward or to leeward, whoſe ſole office it is to obſerve the admiral's ſignals, and inſtantly to repeat them. The eyes of all the ſignal officers in the private ſhips of war are directed to the repeating frigates, as well as to the admiral; and the officers of the repeating frigate, having no other duty, obſerve the admiral inceſſafely, and, being unembarraſſed by the action, can diſplay the ſignal with deliberation, ſo that it may be very diſtinctly ſeen. Being minutely acquainted with the ſubſtitutions which muſt be made on board the admiral when his maſts and rigging are in diſorder, his (perhaps imperfect) ſignal is exhibited by the repeating frigate in its proper form, ſo as to be eaſily underſtood. And to facilitate this communication, the commanders of the different ſquadrons repeat the ſignals of the commander in chief, and the commanders of diviſion repeat the ſignals of the commanders of their ſquadron.

8 Evolution ſignals are preceded by a ſignal of advertiſement, and accompanied with a directive ſignal.

Every evolution ſignal is preceded by a ſignal of ADVERTISEMENT and PREPARATION, which is general, and frequently by a gun, to call attention; and when all the ſignals have been made which direct the different parts of that evolution, another ſignal is made, which marks the cloſe of the complex ſignal, and divides it from others which may immediately follow it: and as the orders of the commander in chief may relate either to the movements of the whole fleet, thoſe of a ſingle diviſion, or thoſe of certain private ſhips, the EXECUTIVE SIGNAL, which dictates the particular movement, is accompanied by a DIRECTIVE SIGNAL, by which theſe ſhips are pointed out, to which the order is addreſſed.

9 Anſwered by the commander to whom they are addreſſed.

The commander of the ſhip to which any ſignal is addreſſed, is generally required to ſignify by a ſignal (which is general) that he has obſerved it. And if he does not thoroughly underſtand its meaning, he intimates this by another general ſignal. And here it is to be obſerved, that as ſoon as the ſignal is anſwered by the ſhips to which it is addreſſed, it is uſual to haul it down, to avoid the confuſion which might ariſe from others being hoiſted in the ſame place. The order remains till executed, notwithſtanding that the ſignal is hauled down.

10 Annulling ſignal.

It may happen that the commander who throws out the ſignal for any piece of ſervice, ſees reaſons for altering his plan. He intimates this by a general ANNULLING ſignal, accompanying the ſignal already given. This will frequently be more ſimple than to make the ſignals for the movements which would be required for re-eſtabliſhing the ſhips in their former ſituation.

All theſe things are of very eaſy comprehenſion, and require little thought for their contrivance. But when we come to the particular evolutions and movements, and to combine theſe with the circumſtances of ſituation in which the fleet may be at the time, it is evident, that much reflection is neceſſary for framing a body of ſignals which may be eaſily exhibited, diſtinctly perceived, and well underſtood, with little riſk of being miſtaken one for another. We ſhall take notice of the circumſtances which chiefly contribute to give them theſe qualities as we proceed in deſcribing their different claſſes.

I. *Of* DAY SIGNALS.

THESE are made by means of the ſhip's ſails, or by colours of various kinds.

Thoſe made with ſails are but few in number, and are almoſt neceſſarily limited to the ſituation of a fleet at anchor. Thus,

The following Signals	*uſually ſignify*
Main topgallant ſtayſail hoiſted	Officers and men belonging to the ſhip to come on board.
Fore topſail looſe	To prepare for ſailing.
Main topſail looſe	To unmoor.
Main topſail ſheets hauled home	To weigh.
Main topſail ſheets clewed up, and the yard hoiſted	Annul the former ſignal, and the ſhip to come to an anchor.
Topgallant ſails looſe, and the ſheets flying	Diſcovering ſtrange ſails.
Main-topgallant ſail looſe and hoiſted. Topſail-yard down	Recal ſhips in chaſe.
Mizen topſail hoiſted, and the ſheets clewed up	Moor.

Before we proceed to the deſcription of the ſignals by means of colours, ſuch as FLAGS, BANNERS (or triangular flags), PENDANTS OF VANES, we muſt take notice of the oſtenſible diſtinctions of the various diviſions and ſubdiviſions of a fleet, ſo that we may underſtand how the ſame ſignal may be addreſſed to a ſquadron, diviſion, or ſingle ſhip or ſhips. We ſuppoſe it known that a fleet of ſhips of war is diſtributed into three grand diviſions (which we ſhall term *ſquadrons*), called the *van*, *centre*, and *rear*. Theſe denominations have not always a relation to the one being more advanced than the other, either towards the enemy, or in the direction of their courſe.

11 Meaning of the terms van, centre, and rear, in the line of battle at ſea.

In a land army, the poſition of every part is conceived from its reference to the enemy; and the reader, conceiving himſelf as facing the enemy, eaſily underſtands the terms *van*, *centre*, and *rear*, the *right* and *left wing*, &c. But the movements of a ſea army having a neceſſary dependence on the wind, they cannot be comprehended unleſs expreſſed in a language which keeps this circumſtance continually in view. The ſimpleſt and moſt eaſily conceived diſpoſition of a fleet, is that in which it is almoſt indiſpenſably obliged to form in order to engage an enemy. This is a ſtraight line, each ſhip directly ahead of its neighbour, and cloſe hauled. This is therefore called the *line of battle*. In this poſition, the two extremities of the fleet correſpond to the right and left wings of an army. Suppoſe this line to be in the direction eaſt and weſt, the wind blowing from the north-north-weſt, and therefore the fleet on the ſtarboard tack; the ſhips heads are to the weſt, and the weſtermoſt diviſion is undoubtedly the van of the fleet, and the eaſtermoſt diviſion is the rear. And it is in conformity to this arrangement and ſituation that the LIST OF THE FLEET is drawn up. But the ſhips may be on the ſame eaſt and weſt line, cloſe hauled, with their heads to the weſt, but the wind blowing from the ſouth-ſouth-weſt. They muſt therefore be on the larboard tack. The ſame ſhips, and the ſame diviſion, are ſtill, in fact, the van of the fleet. But ſuppoſe the ſhips heads to be to the eaſtward, and that they are cloſe hauled,

Naval Signals.

hauled, having the wind from the south-south-east or the north-north-east, the ships which were the real van on both tacks in the former situation are now, in fact, the rear on both tacks; yet they retain the denomination of the *van squadron* of this fleet, and are under the immediate direction of the officer of the second rank, while the other extremity is under the direction of the third officer. This subordination therefore is rather an arrangement of rank and precedence than of evolution. It is, however, considered as the NATURAL ORDER to which the general signals must be accommodated. For this reason, the division which is denominated *van* in the list of this fleet, is *generally* made to lead the fleet when in the line of battle on the starboard tack, and to form the *weathermost* column in *the order of sailing in columns;* and, in general, it occupies that station from which it can most easily pass into the place of the leading division on the starboard line of battle ahead. Although this is a technical nicety of language, and may frequently puzzle a landsman in reading an account of naval operations, the reflecting and intelligent reader will see the propriety of retaining this mode of conceiving the subordinate arrangement of a fleet, and will comprehend the employment of the signals which are necessary for re-establishing this arrangement, or directing the movements while another arrangement is retained.

12 How signals are addressed to each of these divisions.

This being understood, it is easy to contrive various methods of distinguishing every ship by the place which she occupies in the fleet, both with respect to the whole line, with respect to the particular squadron, the particular division of that squadron, and the particular place in that division. This may be done by a combination of the position and colour of the pendants and vanes of each ship. Thus the colour of the pendants may indicate the squadron, their position or mast on which they are hoisted may mark the division of that squadron, and a distinguishing vane may mark the place of the private ship in her own division. The advantages attending this method are many. In a large fleet it would hardly be possible for the commander in chief to find a sufficient variety of single signals to mark the ship to which an order is addressed, by hoisting it along with the signal appropriated to the intended movement. But by this contrivance one-third part of these signals of address is sufficient. It also enables the commander in chief to order a general change of position by a single signal, which otherwise would require several. Thus, suppose that the fore, main, and mizen masts, are appropriated (with the proper modifications) for exhibiting the signals addressed to the van, the centre, and the rear squadrons of the fleet, and that a red, a white, and a blue flag, are chosen for the distinguishing flags of the officers commanding these squadrons; then, if the commander in chief shall hoist a red flag at his mizen topgallant mast head, it must direct the van squadron to take the position then occupied by the rear squadron, the evolution necessary for accomplishing this end being supposed known by the commander of the squadron, who will immediately make the necessary signals to the squadron under his particular direction. In the same manner, the distinguishing signal for the leading ship of a squadron being hoisted along with the signal of address to the whole fleet, and the signal for any particular service, will cause the three or the nine leading ships to execute that order, &c. &c.

All that has been said hitherto may be considered as so many preparations for the real issuing of orders by the commander in chief. The most difficult part of the language remains, viz. to invent a number of signals which shall correspond to that almost infinite variety of movements and services which must be performed.

13 Essential qualities of signals are distinctness,

Distinctness, simplicity, and propriety, are the three essential qualities of all signals. A signal must be some object easily seen, strongly marked, so that it may be readily understood, with little risk of its being mistaken for another. When made by flags, banners, or pendants, they must be of the fullest colours, and strongest contrasts. The ships are frequently at a very great distance, so that the intervening air occasions a great degradation of colour. They are seen between the eye and a very variable sky; and in this situation, especially in the morning or evening, or a dark day, it is not easy to distinguish one full colour from another, all of them approaching to the appearance of a black. At the distance of a very few miles hardly any full colours can be distinguished but a scarlet and a blue. Red, blue, yellow, and white, are the colours which can be distinguished at greater distances than any others, and are therefore the only colours admitted as signals. Even these are sometimes distinguished with difficulty. A yellow is often confounded with a dirty white, and a blue with a red. All other dark colours are found totally unfit. But as these afford but a small variety, we must combine them in one flag, by making it striped, spotted, or chequered, taking care that the opposition of colour may be as great as possible, and that the pieces of which the flags are made up may not be too minute. Red must never be striped nor spotted with blue; and the stripes, spots, or chequers, should never be less than one-third of the breadth of the flag. Plate CCCCXCVI is a selection by an officer of experience as a set very easily recognised, and little liable to be confounded. Their colours are represented by hatching, in the same manner as in heraldry (see HERALDRY).

Difference of shape, as flags, banners, or pendants, is another distinction by which the expression may be varied. And in doing this, we must recollect, that in light winds it may be difficult to distinguish a flag from a banner, as neither are fully displayed for want of wind to detach the fly from the staff.

And, lastly, signals may be varied by their position, which may be on any lofty and well detached part of the masts, yards, or rigging.

14 simplicity,

Simplicity is an eminent property in all signals. They are addressed to persons not much accustomed to combinations, and who are probably much occupied by other pressing duties. It were to be wished that every piece of service could be indicated by a single flag. This is peculiarly desirable with respect to the signals used in time of battle. The rapid succession of events on this occasion call for a multitude of orders from the commander in chief, and his ship is frequently clad over with flags and pendants, so that it is exceedingly difficult for the signal officer of a private ship to distinguish the different groups, each of which make a particular signal.

These

Naval Signals.

15 and propriety.

These considerations are the foundation of a certain *propriety* in signals, which directs us to a choice among marks which appear altogether arbitrary. Signals which run any risk of being confounded, on account of some resemblance, or because their position hinders us from immediately perceiving their difference, should be appropriated to pieces of service which are hardly possible to be executed, or can hardly be wanted, in the same situation. No bad consequence could easily result though the signal for *coming to closer action* should resemble that for *unmooring*, because the present situation of the ships makes the last operation impossible or absurd. Such considerations direct us to select for battle signals, those which are of easiest exhibition, are the most simple, and have the least dependence on the circumstance of position; so that their signification may not be affected by the damages sustained in the masts or rigging of the flag ship. Such signals as are less easily seen at a distance, should be appropriated to orders which can occur only in the middle of the fleet, &c. &c. Signals which are made to the admiral by private ships may be the same with signals of command from the flag ship, which will considerably diminish the number of signals perfectly different from each other.

16 By what means signals are distinctly conveyed,

With all these attentions and precautions a system of signals is at last made up, fitted to the code of sailing and fighting instructions. It is accompanied by another small set for the duty of convoys. It must be engrossed in two books; one for the officer of the flag ship, who is to make the signals, and the other is delivered to every private ship. In the first, the evolutions, movements, and other operations of service, are set down in one column, and their corresponding signals in another. The first column is arranged, either alphabetically, by the distinguishing phrase, or systematically, according to the arrangement of the sailing and fighting instructions. The officer whose duty it is to make the signals, turns to this column for the order which he is to communicate, and in the other column he finds the appropriated signal.

17 and understood.

In the other book, which is consulted for the interpretation of the signals, they are arranged in the leading column, either by the flags, or by the places of their exhibition. The first is the best method, because the derangement of the flag ship's masts and rigging in time of action may occasion a change in the place of the signal.

18 The art of signals much improved since the publication of the *Tactique Navale*.

The *Tactique Navale* of the Chevalier de Morogues contains a very full and elaborate treatise on signals. We recommend this work to every sea-officer, as full of instruction. The art of signals has been greatly simplified since the publication of this work, but we cannot but ascribe much of the improvements to it. We believe that the author is the inventor of that systematic manner of addressing the order or *effective signal* to the different squadrons and divisions of the fleet, by which the art of signals is made more concise, the execution of orders is rendered more systematic, and the commanders of private ships are accustomed to consider themselves as parts of an army, with a mutual dependence and connection. We are ready enough to acknowledge the superiority of the French in manœuvring, but we affect to consider this as an imputation on their courage. Nothing can be more unjust; and dear-bought experience should long ere now have taught us the value of this superiority. What avails that courage which we would willingly arrogate to ourselves, if we cannot come to action with our enemy, or must do it in a situation in which it is almost impossible to succeed, and which needlessly throws away the lives of our gallant crews? Yet this must happen, if our admirals do not make evolutions their careful study, and our captains do not habituate themselves, from their first hoisting a pendant, to consider their own ship as connected with the most remote ship in the line. We cannot think that this view of their situation would in the least lessen the character which they have so justly acquired, of fighting their ship with a courage and firmness unequalled by those of any other nation. And we may add, that it is only by such a rational study of their profession, that the gentleman can be distinguished from the mercenary commander of a privateer.

II. Night Signals.

It is evident, that the communication of orders by night must be more difficult and more imperfect than by day. We must, in general, content ourselves with such orders as are necessary for keeping the fleet together, by directing the more general movements and evolutions which any change of circumstances may render necessary. And here the division and subordinate arrangement of the fleet is of indispensable necessity, it being hardly possible to particularise every ship by a signal of address, or to see her situation. The orders are therefore addressed to the commanders of the different divisions, each of whom is distinguished by his poop and top-lights, and is in the midst of, and not very remote from, the ships under his more particular charge. Yet even in this unfavourable situation, it is frequently necessary to order the movements of particular ships. Actions during the night are not uncommon. Pursuits and rallyings are still oftener carried on at this time. The common dangers of the sea are as frequent and more disastrous. The system of signals therefore is very incomplete till this part be accomplished.

Night signals must be made by guns, or by lights, or by both combined.

19 How gun-signals may be varied.

Gun-signals are susceptible of variety both in number and in disposition. The only distinct variation which can be made in this disposition, is by means of the time elapsed between the discharges. This will easily admit of three varieties, slow, moderate, and quick.—Half-minute guns are as slow as can easily be listened to as appertaining to one signal. Quarter-minute guns are much better, and admit of two very distinct subdivisions. When the gunners, therefore, are well trained to this service (especially since the employment of firelocks for cannon), intervals of 15 or 12 seconds may be taken for slow firing, 8 or 10 seconds for moderate, and 4 or 5 seconds for quick firing. If these could be reduced one half, and made with certainty and precision, the expression would be incomparably more distinct. A very small number of firings varied in this way will give a considerable number of signals. Thus five guns, with the variety of only quick and moderate, will give 20 very distinguishable signals. The same principle must be attended to here as in the flag signals. The most simple must be appropriated to the most important orders, such as occur in the worst weather, or such as are most

moſt liable to be miſtaken. Quick firing ſhould not make part of a ſignal to a very diſtant ſhip, becauſe the noiſe of a gun at a great diſtance is a lengthened ſound, and two of them, with a very ſhort interval, are apt to coaleſce into one long-continued ſound. This mode of varying gun-ſignals by the time muſt therefore be employed with great caution, and we muſt be very certain of the ſteady performance of the gunners.

Note, that a preparatory ſignal or advertiſement that an effective ſignal is to be made, is a very neceſſary circumſtance. It is uſual (at leaſt in hard weather) to make this by a double diſcharge, with an interval of half a ſecond, or at moſt a ſecond.

Gun-ſignals are ſeldom made alone, except in ordinary ſituations and moderate weather; becauſe accident may derange them, and inattention may cauſe them to eſcape notice, and, once made, they are over, and their repetition would change their meaning. They are alſo improper on an enemy's coaſt, or where an enemy's cruiſers or fleets may be expected.

20 Signals by lights.

Signals by lights are either made with LIGHTS ſimply ſo called, i. e. lanthorns ſhown in different parts of the ſhip, or by rockets. Lights may differ by number, and by poſition, and alſo by figure. For the flag ſhip always carrying poop or top-lights, or both, preſents an object in the darkeſt night, ſo that we can tell whether the additional lights are exhibited about the mainmaſt, the foremaſt, the mizenmaſt, &c. And if the lights ſhown from any of theſe ſituations are arranged in certain diſtinguiſhable ſituations in reſpect to each other, the number of ſignals may be greatly increaſed. Thus three lights may be in a vertical line, or in a horizontal line, or in a triangle; and the point of this triangle may be up, or down, or forward, or aft, and thus may have many ſignifications.

Lights are alſo exhibited by falſe fires or rockets: Theſe can be varied by number, and by ſuch differences of appearance as to make them very diſtinguiſhable. Rockets may be with ſtars, with rain fire, or ſimple ſquibs.

21 Theſe two ſpecies of ſignals may be combined.

By varying and combining theſe, a very great number of ſignals may be produced, fully ſufficient to direct every general movement or evolution, or any ordinary and important ſervice. The Chevalier de Morogues has given a ſpecimen of ſuch a ſyſtem of night ſignals, into which he has even introduced ſignals of addreſs or direction to every ſhip of a large fleet; and has alſo given ſignals of number, by which depths of ſoundings, points of the compaſs, and other things of this kind, may be expreſſed both eaſily and diſtinctly. He has made the ſignals by rockets perfectly ſimilar in point of number to thoſe by lanthorns, ſo that the commander can take either; a choice which may have its uſe, becauſe the ſignals by rockets may cauſe the preſence of a fleet to be more extenſively known than may be convenient.

22 General obſervations concerning night ſignals.

The commander in chief will inform the fleet by ſignal, that guns, or perhaps rockets, are not to be uſed that night. This ſignal, at the ſame time, directs the fleet to cloſe the line or columns, that the light ſignals may be better obſerved.

It is indeed a general rule to ſhow as few lights as poſſible; and the commander frequently puts out his own poop and top lights, only ſhowing them from time to time, that his ſhips may keep around him.

The ſignal lanthorns on board the flag ſhip, and a lanthorn kept in readineſs on board of every private ſhip, to anſwer or acknowledge ſignals from the commander in chief, are all kept in bags, to conceal their lights till the moment they are fixed in their places, and the preparatory or advertiſing ſignal has been made.

The commander in chief ſometimes orders by ſignal every ſhip to ſhow a light for a minute or two, that he may judge of the poſition of the fleet; and the admiral's ſignal muſt always be acknowledged by thoſe to whom it is addreſſed.

It is of particular importance that the fleet be kept together. Therefore the leading ſhips of the fleet, on either tack, are enjoined to acknowledge the ſignals of the commander in chief by a ſignal peculiar to their ſtation. Thus the commander in chief learns the poſition of the extremities of his fleet.

In framing a ſet of night ſignals, great attention muſt be given to their poſition, that they be not obſcured by the ſails. The nature of the order to be given will frequently determine this. Thus, an order for the rear ſhips to make more ſail, will naturally direct us to exhibit the ſignal at the mizen peek; and ſo of other pieces of ſervice. Lanthorns expoſed in groups, ſuch as triangles, lozenges, &c. are commonly ſuſpended at the corners of large frames of laths, at the diſtance of a fathom at leaſt from each other. Attempts have been made to ſhow lights of different colours; but the riſk of miſtake or failure in the compoſition at the laboratory, makes this rather hazardous. Coloured lanthorns are more certain; but when the glaſſes are made of a colour ſufficiently intenſe, the vivacity of the light (which at no time is very great) is too much diminiſhed. Beſides, the very diſtance changes the colour exceedingly and unaccountably.

III. *Of* SIGNALS *in a* FOG.

THESE can be made only by noiſes, ſuch as the firing of cannon and muſkets, the beating of drums and ringing of bells, &c. Fog ſignals are the moſt difficult to contrive of any, and are ſuſceptible of the leaſt variety. The commander in chief is principally concerned to keep his fleet together; and unleſs ſomething very urgent requires it, he will make no change in his courſe or rate of ſailing. But a ſhift of wind or other cauſes may make this neceſſary. The changes which he will order, it will be prudent to regulate by ſome fixed rule, which is in general convenient. Thus, when a fleet is in the order of ſailing upon a wind, and a fog comes on, the fleet will hold on the ſame courſe. If the wind ſhould come a little more on the beam, the fleet will ſtill keep cloſe to the wind. Certain general rules of this kind being agreed on, no ſignals are neceſſary for keeping the fleet together; and the ſhips can ſeparate or run foul of each other only by difference in their rate of ſailing, or by inaccurate ſteerage. To prevent this, the commander in chief fires a gun from time to time, and the ſhips of the fleet judge of his ſituation and diſtance by the ſound. The commanders of diviſions fire guns, with ſome diſtinction from thoſe of the commander in chief. This both informs the commander in chief of the poſition of his ſquadrons, and enables the private ſhips of each diviſion to keep in the neighbourhood of their own flag ſhip. On board of every private ſhip the drum is beaten, or the bell is chimed, every

23 By obſerving certain general rules ſignals during a fog are in many caſes unneceſſary.

quarter

Naval Signals.

quarter of an hour, according as the ſhip is on the ſtarboard or larboard tack. By ſuch contrivances, it is never difficult to keep a fleet in very good order when ſailing on a wind. The wind is almoſt always moderate, and the ſhips keep under a very eaſy ſail. It is much more difficult when going large, and ſeparation can be prevented only by the moſt unwearied attention. The greateſt riſk is the falling in with ſtrange ſhips ſteering another courſe.

But evolutions and other movements are frequently indiſpenſable. The courſe muſt be changed by tacking or wearing, and other ſervices muſt be performed. None, however, are admitted but the moſt probable, the moſt ſimple, and the moſt neceſſary.

24
How they are given when neceſſary.

The commander in chief firſt informs the fleet by the *preparatory fog ſignal*, that he is about to order an evolution, and that he is to direct it by *fog ſignals*. This precaution is indiſpenſable to prevent miſtakes. Along with this advertiſing ſignal he makes the ſignal of the movement intended. This not only calls the attention of the fleet, but makes the ſhips prepare for the preciſe execution of that movement. The commanders of diviſions repeat the advertiſing ſignal, which informs their ſhips of their ſituation, and the private ſhips beat their drums or chime their bells. Thus the whole ſhips of the fleet cloſe a little, and become a little better acquainted with their mutual poſition. It is now underſtood that a movement is to be made preciſely a quarter of an hour after the advertiſement. At the expiration of this time, the effective ſignal for this movement is made by the commander in chief, and muſt be inſtantly repeated by the commanders of diviſions, and then the movement muſt be made by each ſhip, according to the ſailing and fighting inſtructions. This muſt be done with the utmoſt attention and preciſion, becauſe it produces a prodigious change in the relative poſition of the ſhips; and even although the good ſenſe of the commander in chief will ſelect ſuch movements for accompliſhing his purpoſe as produce the ſmalleſt alterations, and the leaſt riſk of ſeparation or running foul of each other; it is ſtill extremely difficult to avoid theſe misfortunes. To prevent this as much as poſſible, each ſhip which has executed the movement, or which has come on a courſe thwarting that of the fleet, intimates this by a ſignal properly adapted, often adding the ſignal of the tack on which it is now ſtanding, and even its particular ſignal of recognizance. This is particularly incumbent on the flag ſhips and the leading ſhips of each diviſion.

After a reaſonable interval, the commander in chief will make proper ſignals for bringing the fleet to a knowledge of their reunion in this new poſition.

25
Improper to publiſh a particular account of ſignals.

This muſt ſerve for a general account of the circumſtances which muſt be attended to in framing a code of ſignals. The arbitrary characters in which the language is written muſt be left to the ſagacity of the gentlemen of the profeſſion. It muſt be obſerved, that the ſtratagems of war make ſecrecy very neceſſary. It may be of immenſe hazard if the enemy ſhould underſtand our ſignals. In time of battle it might frequently fruſtrate our attempts to deſtroy them, and at all times would enable them to eſcape, or to throw us into diſorder. Every commander of a ſquadron, therefore, iſſues private ſignals, ſuited to his particular deſtination; and therefore it is neceſſary that our code of ſignals be ſuſceptible of endleſs variations. This is exceedingly eaſy without any increaſe of their number. The commander needs only intimate that ſuch and ſuch a ſignal is ſo and ſo changed in its meaning during his command.

26
Signals may be made the immediate expreſſions of numbers.

We cannot leave this article without returning to an obſervation which we made almoſt in the beginning, viz. that the ſyſtem of ſignals, or, to ſpeak more properly, the manner of framing this ſyſtem, has received much improvement from the gentlemen of the French navy, and particularly from the moſt ingenious thought of M. de la Bourdonnais, of making the ſignals the immediate expreſſions of *numbers* only, which numbers may be afterwards uſed to indicate any order whatever. We ſhall preſent our readers with a ſcheme or two of the manner in which this may be done for all ſignals, both day, night, and fog. This alone may be conſidered as a ſyſtem of ſignals, and is equally applicable to every kind of information at a diſtance. Without detracting in the ſmalleſt degree from the praiſe due to M. de la Bourdonnais, we muſt obſerve, that this principle of *notation* is of much older date. Biſhop Wilkins, in his Secret and Swift Meſſenger, expreſly recommends it, and gives ſpecimens of the manner of execution; ſo does Dr Hooke in ſome of his propoſals to the Royal Society. Gaſpar Schottus alſo mentions it in his *Technica Curioſa*; and Kircher, among others of his Curious Projects.

27
M. de la Bourdonnais's method for doing this

M. de la Bourdonnais's method is as follows:

He chooſes pendants for his effective ſignals, becauſe they are the moſt eaſily diſplayed in the proper order. Several pendants, making part of one ſignal, may be hoiſted by one hallyard, being ſtopped on it at the diſtance of four or ſix feet from each other. If it be found proper to throw out another ſignal at the ſame time and place, they are ſeparated by a red pendant without a point. His colours are choſen with judgement, being very diſtinctly recogniſed, and not liable to be confounded with the addreſſing ſignals appropriated to the different ſhips of the fleet. They are,

For N° 1. Red.	For N° 6. Red, with blue tail.
2. White.	7. White, with blue tail.
3. Blue.	8. White, with red tail.
4. Yellow.	9. Blue, with yellow tail.
5. Red, with white tail.	10. Yellow, with blue tail.

Three ſets of ſuch pendants will expreſs every number under a thouſand, by hoiſting one above the other, and reckoning the uppermoſt hundreds, the next below it tens, and the loweſt units. Thus the number 643 will be expreſſed by a pendant red with blue tail, a yellow pendant below it, and a blue one below the laſt.

This method has great advantages. The ſignals may be hoiſted in any place where beſt ſeen, and therefore the ſignification is not affected by the derangement of the flag ſhip's maſts and rigging. And by appropriating the ſmaller numbers to the battle ſignals, they are more ſimple, requiring fewer pendants.

28
might be rendered much ſimpler by uſing fewer colours.

As this method requires a particular ſet of colours, it has its inconveniences. An admiral is often obliged to ſhift his flag, even in time of action. He cannot eaſily take the colours along with him. It is therefore better to make uſe of ſuch colours as every private ſhip is provided with. One ſet of 11 will do, with the addition

Naval Signals.

dition of three, at moſt of four pendants, of ſingular make, to mark 100, 200, 300, 400. Two of theſe flags, one above the other, will expreſs any number under 100, by uſing the 11th as a ſubſtitute for any flag that ſhould be repeated. Thus the 11th flag, along with the flag for eight or for ſix, will expreſs the number 88 or 66, &c. Thus we are able to expreſs every number below 500, and this is ſufficient for a very large code of ſignals.

And in order to diminiſh as much as poſſible the number of theſe compound ſignals, it will be proper that a number of ſingle flag ſignals be preſerved, and even varied by circumſtances of poſition, for orders which are of very frequent occurrence, and which can hardly occur in ſituations where any obſtructions are occaſioned by loſs of maſts, &c. And farther, to avoid all chance of miſtake, a particular ſignal can be added, intimating that the ſignals now exhibited are numerary ſignals; or, which is ſtill better, all ſignals may be conſidered as numerary ſignals; and thoſe which we have juſt now called *ſingle flag ſignals* may be ſet down oppoſite to, or as expreſſing, the largeſt numbers of the code.

This method requires the ſignal of advertiſement, the annulling ſignal, the ſignal of addreſs to the particular ſhip or diviſion, the ſignal of acknowledgement, the ſignal of indiſtinctneſs, of diſtreſs, of danger, and one or two more which, in every method, muſt be employed.

29 Another method of expreſſing numbers by fewer colours,

Another method of expreſſing numbers with fewer colours is as follows: Let the flags be A, B, C, D, E, F, and arrange them as follows:

	A	B	C	D	E	F
	1	2	3	4	5	6
A	7	8	9	10	11	12
B	13	14	15	16	17	18
C	19	20	21	22	23	24
D	25	26	27	28	29	30
E	31	32	33	34	35	36
F	37	38	39	40	41	42

The number expreſſed by any pair of flags is found in the interſection of the horizontal and perpendicular columns. Thus the flag D, hoiſted along with and above the flag F, expreſſes the number 40, &c. In order to expreſs a greater number (but not exceeding 84) ſuppoſe 75, hoiſt the flags $\frac{C}{E}$, which expreſſes 33, or 75 wanting 42, and above them a flag or ſignal G, which alone expreſſes 42.

30 which may be alſo improved.

This method may be ſtill farther improved by arranging the flags thus:

	A	B	C	D	E	F
	1	2	3	4	5	6
A	7	8	9	10	11	12
B	—	13	14	15	16	17
C	—	—	18	19	20	21
D	—	—	—	22	23	24
E	—	—	—	—	25	26
F	—	—	—	—	—	27

In this laſt method the ſignification of the ſignal is totally independent of the poſition of the flags. In whatever parts of the ſhip the flags D and E are ſeen, they expreſs the number 23. This would ſuit battle ſignals.

31 third method

Another method ſtill may be taken. Flags hoiſted anywhere on the foremaſt may be accounted units, thoſe on the mainmaſt tens, and thoſe on the mizenmaſt hundreds. Thus numeral ſignals may be made by a ſhip diſmaſted, or having only poles in their place.

Many other ways may be contrived for expreſſing numbers by colours, and there is great room for exerciſing the judgement of the contriver. For it muſt always be remembered, that theſe ſignals muſt be accompanied with a ſignal by which it is addreſſed to ſome particular ſhip or diviſion of the fleet, and it may be difficult to connect the one with the other, which is perhaps ſhown in another place, and along with other executive ſignals.

32 Advantages of numeral ſignals.

One great advantage of theſe numeral ſignals is, that they may be changed in their ſignification at pleaſure. Thus, in the firſt method, it can be ſettled, that on Sundays the colours A, B, C, D, &c. expreſs the cyphers, 1, 2, 3, 4, &c. but that on Mondays they expreſs the cyphers 0, 1, 2, 3, &c. and on Tueſdays the cyphers 9, 0, 1, 2, &c.; and ſo on through all the days of the week. This mean of ſecrecy is mentioned by Dr Hooke for the coaſt and alarm ſignals, where, by the by, he ſhews a method for conveying intelligence over land very ſimilar to what is now practiſed by the French with their telegraph.

33 Numbers may be alſo expreſſed by night ſignals.

It is equally eaſy to expreſs numbers by night ſignals. Thus M. de la Bourdonnais propoſes, that one diſcharge of a great gun ſhall expreſs 7, and that 1, 2, 3, 4, 5, 6 ſhall be expreſſed by lights. Therefore, to expreſs 24, we muſt fire three guns, and ſhow three lights. This is the moſt perfect of all forms of night and fog ſignals. For both the manner of firing guns and of exhibiting lights may be varied to a ſufficient extent with very few guns or lights, and with great diſtinctneſs.

Thus, for guns. Let F mark the firing of a ſingle gun at moderate intervals, and *ff* a double gun, that is, two diſcharged at the interval of a ſecond. We may expreſs numbers thus:

1	F.
2	F, F.
3	F, F, F.
4	F, F, F, F.
5	F, *ff*.
6	F, F, *ff*.
7	F. *ff*, F.
8	F, *ff*, F, F.
9	F, *ff*, F, *ff*.
10	*ff*.
100, &c.	*ff*, *ff*, or *fff*.

It might be done with fewer guns if the *ff* were admitted as the firſt firing. But it ſeems better to begin always with the ſingle gun, and thus the double gun beginning a ſignal diſtinguiſhes the tens &c.

In like manner, a ſmall number of lights will admit of a great variety of very diſtinct poſitions, which may ſerve for all ſignals to ſhips not very remote from the commander in chief. For orders to be underſtood at a very great diſtance, it will be proper to appropriate the numbers which are indicated by ſignals made with rockets.

rockets. Thefe can be varied in number and kind to a fufficient extent, fo as to be very eafily diftinguifhed and underftood. It is fufficient to have fhown how the whole, or nearly the whole, notation of fignals may be limited to the expreffion of numbers.

34 Concluding remarks.

We have taken little notice of the fignals made by private fhips to the commander in chief. This is a very eafy bufinefs, becaufe there is little rifk of confounding them with other fignals. Nor have we fpoken of fignals from the flag fhips whofe ultimate interpretation is number, as when fhips are directed to change their courfe fo many points. Thofe alfo are eafily contrived in any of the methods already defcribed : alfo when a private fhip wifhes to inform the commander in chief that foundings are found at fo many fathoms. In like manner, by numbering the points of the compafs, the admiral can direct to chace to any one of them, or may be informed of ftrange fhips being feen in any quarter, and what is their number.

SIGNALS by the Drum, made ufe of, in the exercife of the army, inftead of the word of command, viz.

Signals.	*Operations.*
A fhort roll, -	To caution.
A flam, -	To perform any diftinct thing.
To arms, - -	To form the line or battalion.
The march, -	To advance, except when intended for a falute.
The quick march, -	To advance quick.
The point of war, -	To march and charge.
The retreat, -	To retreat.
Drum ceafing, -	To halt.
Two fhort rolls, -	To perform the flank firing.
The dragoon march,	To open the battalion.
The grenadier march,	To form the column.
The troop, -	To double divifions.
The long roll, -	To form the fquare.
The grenadier march,	To reduce the fquare to the column.
The preparative, -	To make ready and fire.
The general, -	To ceafe firing.
Two long rolls, -	To bring or lodge the colours.

SIGNATURE, a fign or mark impreffed upon any thing, whether by nature or art. Such is the general fignification of the word ; but in the plural number it has been ufed, in a particular fenfe, to denote thofe external marks by which phyfiognomifts and other dabblers in the occult fciences pretend to difcover the nature and internal qualities of every thing on which they are found. According to Lavater, every corporeal object is characterized by fignatures peculiar to itfelf.

The doctrine of fignatures, like alchemy and aftrology, was very prevalent during the 15th and 16th centuries ; and was confidered as one of the occult fciences which conferred no fmall degree of honour on their refpective profeffors. Some of thefe philofophers, as they thought fit to ftyle themfelves, maintained that plants, minerals, and animals, but particularly plants, had fignatures impreffed on them by the hand of nature, indicating to the adept the *therapeutic* ufes to which they might be applied. Others, fuch as the myftic theofophifts and chemifts of that day, proceeded much farther in abfurdity, maintaining that every fubftance in nature had either *external* fignatures immediately difcernible, or *internal* fignatures, which, when brought into view by fire or menftrua, denoted its connection with fome fidereal or celeftial archetype. Of the doctrine of fignatures, as it relates merely to the therapeutic ufes of plants and minerals, traces are to be found in the works of fome of the greateft authors of antiquity ; but the celeftial fignatures, we believe, were difcovered only by the moonlight of the monkifh ages. Pliny informs us *, that the marble called *aphites*, from its being fpotted like a ferpent, was difcovered by thofe fpots to be a fovereign remedy for the bite of that animal ; and that the colour of the *hæmatites* or blood-ftone intimated that it was fit to be employed to ftop an hemorrhagy ; but we do not recollect his attributing the virtues of thefe minerals to a fidereal or celeftial influence.

* *Hift. Nat.* lib. 34.

SIGNATURE, a figning of a perfon's name at the bottom of an act or deed written by his own hand.

SIGNATURE, in *Printing*, is a letter put at the bottom of the firft page at leaft, in each fheet, as a direction to the binder in folding, gathering, and collating them. The fignatures confift of the capital letters of the alphabet, which change in every fheet ; if there be more fheets than letters in the alphabet, to the capital letter is added a fmall one of the fame fort, as A a, B b ; which are repeated as often as neceffary. In large volumes it is eafy to diftinguifh the number of alphabets, after the firft three or four, by placing a figure before the fignature, as 5 B, 6 B, &c.

SIGNET, one of the king's feals, made ufe of in fealing his private letters, and all grants that pafs by bill figned under his majefty's hand : it is always in the cuftody of the fecretaries of ftate.

SIGNET, in *Scots Law*. See LAW, Part III. § 17.

SILENE, CATCHFLY, or *Vifcous Campion*, a genus of plants belonging to the clafs *decandria*, and order *trigynia* ; and in the natural fyftem arranged under the 22d order, *caryophylleæ*. See BOTANY *Index*.

SILESIA, a duchy of Germany, bounded on the eaft by Poland ; on the weft, by Bohemia and Lower Lufatia ; on the fouth, by a chain of mountains, and a thicket of confiderable extent which feparates it from Hungary ; and to the north, by the marquifate of Brandenburg and Poland. From north-weft to fouth-eaft it is about 274 miles, and about 100 where broadeft : but it is much contracted at both ends. Upon the frontiers of this country, to the weft and fouth, are very high mountains, and fome likewife in other parts of it. One of the ridges upon the frontiers is ftyled the *Riphæan Mountains*, another the *Moravian*, another the *Bohemian*, and another the *Hungarian*, *Crapack*, or *Carpathian*. A branch of the Bohemian is called the *Giant Mountains*. The winter on thefe hilly tracts is more fevere, fets in fooner, and lafts longer, than in the low lands. The inhabitants ufe a kind of fkates when the fnow is deep, as they do in Carniola. Little or no grain is raifed in the mountains and fome fandy tracts ; but the reft of the country is abundantly fruitful, not only in grain, but fruits, roots, pafture, flax, hops, madder, tobacco, and hemp, yielding alfo fome wine, with confiderable quantities of filk and honey. In many places are great woods of pines, fir, beech, larch, and other trees, affording tar, pitch, rofin, turpentine, lamp-black, and timber for all ufes. In this country alfo is found marble of feveral forts, fome precious ftones, lime-ftone, millftone, pitcoal, turf, vitriol, fome filver ore, copper, lead, iron, and mineral fprings. Great numbers

bers of black cattle and horses are brought hither from Poland and Hungary for sale, those bred in the country not being sufficient; but of sheep, goats, game, and venison, they have great plenty. As for wild beasts, here are lynxes, foxes, weasels, otters, and beavers. The rivers, lakes, and ponds, yield fish of several sorts, particularly sturgeons several ells in length, and salmon. Besides a number of smaller streams to water this country, there is the Oder, which traverses it almost from one end to the other; and the Vistula, which after a pretty long course through it enters Poland. The number of the cities and market-towns is said to be about 200, the county of Glatz included, and that of the villages 5000. The inhabitants, who are computed to be about 1,821,065 are a mixture of Germans, Poles, and Moravians. The language generally spoken is German; but in some places the vulgar tongue is a dialect of the Sclavonic. The states consist of the princes and dukes, and those called *state-lords*, with the nobility, who are immediately subject to the sovereign, and the representatives of the chief cities; but since the country fell under the dominion of the king of Prussia, no diets have been held. The king, however, when he took possession of the country, confirmed all the other privileges of the inhabitants. With respect to religion, not only Protestants, but Papists, Jews, and Greeks, enjoy full liberty of conscience. The greatest part of Silesia lies in the diocese of Breslaw, but some part of it in the Polish dioceses of Posen and Cracow. The bishop of Breslaw stands immediately under the pope with regard to spirituals; but all ecclesiastical benefices, not excepting the see of Breslaw, is in the king's gift. Besides Latin schools, colleges, and seminaries, at Breslaw is an university, and at Lignitz an academy for martial exercises. The principal manufactures here are woollens, linens, and cottons of several sorts, with hats, glass-ware, gunpowder, and iron manufactures. Of these there is a considerable exportation. Accounts are generally kept in rix-dollars, silver groschens, and ducats. With respect to its revolutions and present government, it was long a part of the kingdom of Poland; afterwards it had several dukes and petty princes for its sovereigns, who by degrees became subject to the kings of Bohemia, until at last King Charles IV. incorporated the whole duchy with Bohemia; and thus it continued in the possession of the house of Austria, until the king of Prussia in 1742, taking advantage of the troubles that ensued upon the death of the emperor Charles VI. and pretending a kind of claim, wrested a great part of it, together with the county of Glatz, from his daughter and heiress Maria Theresa, the late empress dowager; so that now only a small part of it is possessed by the house of Austria, and connected with the empire, the rest being governed by the king of Prussia, without acknowledging any sort of dependence on the crown of Bohemia or the empire. For the administration of justice in all civil, criminal, and feudal cases, and such as relate to the revenue, the king of Prussia has established three supreme judicatories, to which an appeal lies from all the inferior ones, and from which, when the sum exceeds 500 rix-dollars, causes may be moved to Berlin. The Lutheran churches and schools are under the inspection of the upper consistories, and those of the Papists under that of the bishop's court at Breslaw; but from both an appeal lies to the tribunal at Berlin. As to the revenue, the excise here is levied only in the walled towns, being on the same footing as in the marquisate of Brandenburg; but in the rest of the country the contributions are fixed, and the same both in peace and war. The several branches of the revenue are under the management of the war and domain offices of Breslaw and Glogau. The whole revenue arising to the king of Prussia from Silesia and the county of Glatz amounts to about four millions of rix-dollars per annum.

Silesia is divided into Upper and Lower, and each of these again into principalities and lordships; of some of which both the property and jurisdiction belong immediately to the sovereign, but of others to his subjects and vassals. In regard to the character of the people, the boors are accounted very dull and stupid; but of those of a higher rank, many have distinguished themselves by their wit and learning, as well as by their military and political talents.

SILESIAN EARTH, in the *Materia Medica*, a fine astringent bole. It is very heavy, of a firm compact texture, and in colour of a brownish yellow. It breaks easily between the fingers, and does not stain the hands; is naturally of a smooth surface, is readily diffusible in water, and melts freely into a butter-like substance in the mouth. It leaves no grittiness between the teeth, and does not ferment with acids. It is found in the perpendicular fissures of rocks near the gold mines in Hungary.

SILICERNIUM, among the Romans, was a feast of a private nature, provided for the dead some time after the funeral. It consisted of beans, lettuces, bread, eggs, &c. These were laid upon the tomb, and they foolishly believed that the dead would come out for the repast. What was left was generally burnt on the stone. The word *silicernium* is derived from *silex* and *cæna*, i. e. "a supper upon a stone." Eating what had thus been provided for the dead, was esteemed a mark of the most miserable poverty. A similar entertainment was made by the Greeks at the tombs of the deceased; but it was usual among them to treat the ghosts with the fragments from the feast of the living. See FUNERAL and INFERIÆ.

SILEX. See FLINT.

SILICEOUS EARTHS. See SILICA, CHEMISTRY *Index*.

SILIUS ITALICUS, CAIUS, an ancient Roman poet, and author of an epic poem in 17 books, which contains an history of the second Punic war, so famous for having decided the empire of the world in favour of the Romans. He was born in the reign of Tiberius, and is supposed to have derived the name of *Italicus* from the place of his birth; but whether he was born at Italica in Spain, or at Corfinium in Italy, which, according to Strabo, had the name of *Italica* given it during the Social war, is a point which cannot be known; though, if his birth had happened at either of these places, the grammarians would tell us, that he should have been called *Italicensis*, and not *Italicus*. When he came to Rome, he applied himself to the bar; and, by a close imitation of Cicero, succeeded so well, that he became a celebrated advocate and most accomplished orator. His merit and character recommended him to the highest offices in the republic, even to the consulship, of which he was possessed when Nero died. He is said to

Silius, Silk. have been aiding and affifting in accufing perfons of high rank and fortune, whom that wicked emperor had devoted to deftruction: but he retrieved his character afterwards by a long and uniform courfe of virtuous behaviour. Vefpafian fent him as proconful into Afia, where he behaved with clean hands and unblemifhed reputation. After having thus fpent the beft part of his life in the fervice of his country, he bade adieu to public affairs, refolving to confecrate the remainder to polite retirement and the mufes. He had feveral fine villas in the country: one at Tufculum, celebrated for having been Cicero's; and a farm near Naples, faid to have been Virgil's, at which was his tomb, which Silius often vifited. Thus Martial compliments him on both thefe accounts:

Silius hæc magni celebrat monumenta Maronis,
Jugera facundi qui Ciceronis habet.
Hæredem Dominumque fui tumulique larifque
Non alium mallet nec Maro nec Cicero.
Epigr. 49. lib. xi.

Of Tully's feat my Silius is poffefs'd,
And his the tomb where Virgil's afhes reft.
Could thofe great fhades return to choofe their heir,
The prefent owner they would both prefer.

In thefe retirements he applied himfelf to poetry: led not fo much by any great force of genius, which would certainly not have fuffered him to ftay till life was in the wane and his imagination growing cold, as by his exceeding great love of Virgil, to whofe memory he paid the higheft veneration. He has imitated him in his poem; and though he falls infinitely fhort of him, yet he has difcovered a great and univerfal genius, which would have enabled him to fucceed in fome degree in whatever he undertook.

Having been for fome time afflicted with an impofthume, which was deemed incurable, he grew weary of life, to which, in the language of Pliny, he put an end with determined courage.

There have been many editions of Silius Italicus. A neat and correct one was publifhed at Leipfic in 1696, in 8vo, with fhort and ufeful notes by Cellarius: but the beft is that *cum notis integris variorum et Arnoldi Drakenborch.* Traject. ad Rhen. 1717, in 4to.

SILK, a very foft, fine, bright thread, the work of an infect called *bombyx*, or the filk worm.

As the filk worm is a native of China, the culture of filk in ancient times was entirely confined to that country. We are told that the empreffes, furrounded by their women, fpent their leifure hours in hatching and rearing filk worms, and in weaving tiffues and filk veils. That this example was foon imitated by perfons of all ranks, we have reafon to conclude; for we are informed that the Chinefe, who were formerly clothed in fkins, in a fhort time after were dreffed in veftments of filk. Till the reign of Juftinian, the filk worm was unknown beyond the territories of China, but filk was introduced into Perfia long before that period. After the conqueft of the Perfian empire by Alexander the Great, this valuable commodity was brought into Greece, and thence conveyed to Rome. The firft of the Roman writers extant by whom filk is mentioned, are Virgil and Horace; but it is probable that neither of them knew from what country it was obtained, nor how it was produced. By fome of the ancients it was fuppofed to be a fine down adhering to the leaves of certain trees or flowers. Others imagined it to be a delicate fpecies of wool or cotton; and even thofe who had learned that it was the work of an infect, fhow by their defcriptions that they had no diftinct idea of the manner in which it was formed. Among the Romans, filk was deemed a drefs too expenfive and too delicate for men, and was appropriated wholly to women of eminent rank and opulence. Elagabulus is faid to have been the firft man among the Romans who wore a garment of fine filk: Aurelian complained that a pound of filk was fold at Rome for 12 ounces of gold; and it is faid he refufed to give his wife permiffion to wear it on account of its exorbitant price.

1 Opinions of the ancients concerning the nature of filk.

2 Brought from China by the Perfians till the time of Juftinian.

For feveral centuries the Perfians fupplied the Roman empire with the filks of China. Caravans traverfed the whole latitude of Afia, in 243 days, from the Chinefe ocean to the fea-coaft of Syria, carrying this commodity. Sometimes it was conveyed to the ports of Guzerat and Malabar, and thence tranfported by fea to the Perfian gulf. The Perfians, with the ufual rapacity of monopolifts, raifed the price of filk to fuch an exorbitant height, that Juftinian, eager not only to obtain a full and certain fupply of a commodity which was become of indifpenfable ufe, but folicitous to deliver the commerce of his fubjects from the exactions of his enemies, endeavoured, by means of his ally, the Chriftian monarch of Abyffinia, to wreft fome portion of the filk trade from the Perfians. In this attempt he failed; but when he leaft expected it, he, by an unforefeen event, attained, in fome meafure, the object which he had in view. Two Perfian monks having been employed as miffionaries in fome of the Chriftian churches, which were eftablifhed (as we are informed by Cofmas) in different parts of India, had penetrated into the country of the Seres, or China. There they obferved the labours of the filk worm, and became acquainted with all the arts of man in working up its productions into fuch a variety of elegant fabrics. The profpect of gain, or perhaps an indignant zeal, excited by feeing this lucrative branch of commerce engroffed by unbelieving nations, prompted them to repair to Conftantinople. There they explained to the emperor the origin of filk, as well as the various modes of preparing and manufacturing it, myfteries hitherto unknown, or very imperfectly underftood in Europe; and encouraged by his liberal promifes, they undertook to bring to the capital a fufficient number of thofe wonderful infects, to whofe labours man is fo much indebted. This they accomplifhed, by conveying the eggs of the filk worm in a hollow cane. They were hatched by the heat of a dunghill, fed with the leaves of a wild mulberry tree, and they multiplied and worked in the fame manner as in thofe climates where they firft became objects of human attention and care. Vaft numbers of thefe infects were foon reared in different parts of Greece, particularly in the Peloponnefus. Sicily afterwards undertook to breed filk worms with equal fuccefs, and was imitated, from time to time, in feveral towns of Italy. In all thefe places extenfive manufactures were eftablifhed and carried on with filk of domeftic production. The demand for filk from the eaft diminifhed of courfe, the fubjects of the Greek emperors were no longer obliged to have recourfe to the Perfians for a fupply of it, and a confiderable change took place in

Robertfon's Difquifition concerning India, p. 58.

3 Silk worms introduced into Europe by two monks.

in the nature of the commercial intercourfe between Europe and India.

As filk is the production of a worm, it will be firft neceffary to give a defcription of its nature and mode of manufacturing. But before we give any account of the moft approved methods of managing filk worms in Europe, it will be proper to prefent a fhort defcription of the methods practifed in China, the original country of the filk worm. Thefe are two: they either permit them to remain at liberty on mulberry trees, or keep them in rooms. As the fineft filk is produced by worms confined in rooms, and as the firft method is very fimple, it will fuffice to defcribe the fecond.

4 Method of rearing filk worms in China.

To begin with the eggs, which are laid on large fheets of paper, to which they firmly adhere. The fheets are hung up on a beam of the room, with the eggs inward, and the windows are opened in the front to admit the wind; but no hempen ropes muft ever come near the worms or their eggs. After fome days the fheets are taken down, rolled up loofely with the eggs inward, and then hung up again, during the fummer and autumn. At the end of December, or the beginning of January, the eggs are put into cold water, with a little falt diffolved in it. Two days after they take them out, hang them up again, and when dry roll them a little tighter, and enclofe each feparately, ftanding on one end in an earthen veffel. Some put them into a lye made of mulberry tree afhes, and then lay them fome moments in fnow-water, or elfe hang them up three nights on a mulberry tree to receive the fnow or rain, if not too violent. The time of hatching them is when the leaves of the mulberry trees begin to open, for they are haftened or impeded according to the different degrees of heat or cold to which they are expofed. When they are ready to come forth, the eggs fwell, and become a little pointed.

The third day before they are hatched, the rolls of paper are taken out of the veffel, ftretched out, and hung up with their backs toward the fun, till they receive a kindly warmth; and then being rolled up clofe, they are fet upright in a veffel in a warm place. This is repeated the next day, and the eggs change to an afh-gray. They then put two fheets together, and rolling them clofe tie the ends.

The third day, towards night, the fheets are unrolled and ftretched on a fine mat, when the eggs appear blackifh. They then roll three fheets together, and carry them into a pretty warm place, fheltered from the fouth wind. The next day the people taking out the rolls, and opening them, find them full of worms like fmall black ants.

The apartment chofen for filk worms is on a dry ground, in a pure air, and free from noife. The rooms are fquare, and very clofe, for the fake of warmth; the door faces the fouth, and is covered with a double mat, to keep out the cold; yet there fhould be a window on every fide, that when it is thought neceffary the air may have a free paffage. In opening a window to let in a refrefhing breeze, care muft be taken to keep out the gnats and flies. The room muft be furnifhed with nine or ten rows of frames, about nine inches one above the other. On thefe they place rufh hurdles, upon which the worms are fed till they are ready to fpin; and, to preferve a regular heat, ftove fires are placed at the corners of the room, or elfe a warming pan is carried up and down it; but it muft not have the leaft flame or fmoke. Cow-dung dried in the fun is efteemed the moft proper fuel.

The worms eat equally day and night. The Chinefe give them on the firft day forty-eight meals, that is, one every half hour; the next thirty; the third day they have ftill lefs. As cloudy and rainy weather takes away their ftomach, juft before their repaft a wifp of very dry ftraw, the flame of which muft be all alike, is held over the worms to free them from the cold and moifture that benumbs them, or elfe the blinds are taken from the windows to let in the full day-light.

Eating fo often haftens their growth, on which the chief profit of the filk worm depends. If they come to maturity in 23 or 25 days, a large fheet of paper covered with worms, which at their firft coming from the eggs weigh little more than a drachm, will produce 25 ounces of filk; but if not till 28 days, they then yield only 20 ounces; and if they are a month or 40 days in growing, they then produce but ten.

They are kept extremely clean, and are often removed; and when they are pretty well grown, the worms belonging to one hurdle are divided into three, afterwards they are placed on fix, and fo on to the number of 20 or more; for being full of humours, they muft be kept at a due diftance from each other. The critical moment for removing them is when they are of a bright yellow and ready to fpin; they muft be furrounded with mats at a fmall diftance, which muft cover the top of the place to keep off the outward air; and becaufe they love to work in the dark. However, after the third day's labour, the mats are taken away from one o'clock till three, but the rays of the fun muft not fhine upon them. They are at this time covered with the fheets of paper that were ufed on the hurdles.

The cocoons are completed in feven days, after which the worm is metamorphofed into a chryfalis; the cocoons are then gathered, and laid in heaps, having firft fet apart thofe defigned for propagation upon a hurdle, in a cool airy place. The next care is to kill the moths in thofe cones which are not to be bored. The beft way of doing this is to fill large earthen veffels with cones in layers of ten pounds each, throwing in four ounces of falt with every layer, and covering it with large dry leaves like thofe of the water-lily, and clofely ftopping the mouth of the veffels. But in laying the cones into the veffels, they feparate the long, white, and glittering ones, which yield a very fine filk, from thofe that are thick, dark, and of the colour of the fkin of an onion, which produce a coarfer filk.

5 Defcription and hiftory of the filk worm.

The filk worm is a fpecies of caterpillar, which, like all others of the fame clafs, undergoes a variety of changes, that, to perfons who are not acquainted with objects of this kind, will appear to be not a little furprifing.

It is produced from a yellowifh-coloured egg, about the fize of a fmall pin-head, which has been laid by a kind of grayifh-coloured moth, which the vulgar confound with the butterfly. *The Bee*, N° 72.

Thefe eggs, in the temperature of this climate, if kept beyond the reach of the fire and funfhine, may be preferved during the whole of the winter and fpring months without danger of hatching: and even in fummer they may eafily be prevented from hatching if they be kept in a cool place; but in warmer climates it is

Silk.

scarcely possible to preserve them from hatching, even for a few days, or from drying so much as to destroy them. Hence it is easy for a native of Britain to keep the eggs till the food on which the worm is to feed be ready for that purpose. When this food is in perfection, the eggs need only be exposed to the sun for a day or two, when they will be hatched with great facility.

When the animal is first protruded from the egg, it is a small black worm, which is active, and naturally ascends to the top of the heap in search of food. At this stage of his growth the silk worm requires to be fed with the youngest and most tender leaves. On these leaves, if good, he will feed very freely for about eight days, during which period he increases in size to about a quarter of an inch in length. He is then attacked with his first sickness, which consists in a kind of lethargic sleep for about three days continuance; during which time he refuses to eat, and changes his skin, preserving the same bulk. This sleep being over, he begins to eat again, during five days, at which term he is grown to the size of full half an inch in length; after which follows a second sickness in every respect like the former.

He then feeds for other five days; during which time he will have increased to about three quarters of an inch in length, when he is attacked with his third sickness. This being over, he begins to eat again, and continues to do so for five days more, when he is attacked by his fourth sickness, at which time he is arrived at his full growth. When he recovers this sickness, he feeds once more during five days with a most voracious appetite; after which he disdains his food, becomes transparent, a little on the yellowish cast, and leaves his silky traces on the leaves where he passes. These signs denote that he is ready to begin his cocoon, and will eat no more.

Thus it appears that the whole duration of the life of the worm, in this state of its existence, in our climate, is usually about 46 days; 28 of which days he takes food, and remains in his sick or torpid state 18; but it is to be observed, that during warm weather the periods of sickness are shortened, and in cold weather lengthened, above the terms here specified. In very hot climates it may be said to live faster, and sooner to attain maturity, than in those that are colder. Dr Anderson informs us, that at Madras the worm undergoes its whole evolutions in the space of 22 days. It appears, however, that it feeds fully as many days in India as in Europe, the difference being entirely occasioned by shortening the period of sickness. The longest sickness he had seen them experience there did not exceed two days; and during summer it only lasts a few hours.

When the worm has attained its full growth, it searches about for a convenient place for forming its cocoon, and mounts upon any branches or twigs that are put in its way for that purpose. After about two days spent in this manner, it settles in its place, and forms the cocoon, by winding the silk which it draws from its bowels round itself into an oblong roundish ball.

During this operation it gradually loses the appearance of a worm; its length is much contracted, and its thickness augmented. By the time the web is finished, it is found to be transformed into an oblong roundish ball, covered with a smooth shelly skin, and appears to be perfectly dead. In this state of existence it is called an *aurelia*. Many animals in this state may be often seen sticking on the walls of out-houses, somewhat resembling a small bean.

In this state it remains for several days entirely motionless in the heart of the cocoon, after which it bursts like an egg hatching, and from that comes forth a heavy dull-looking moth with wings; but these wings it never uses for flying; it only crawls slowly about in the place it has been hatched. This creature forces its way through the silk covering which the worm had woven, goes immediately in quest of its mate, after which the female lays her eggs; and both male and female, without tasting food in this stage of their existence, die in a very short time.

The silk worm, when at its full size, is from an inch and a quarter to an inch and a half in length, and about half an inch in circumference. He is either of a milk or pearl colour, or blackish; these last are esteemed the best. His body is divided into seven rings, to each of which are joined two very short feet. He has a small point like a thorn exactly above the anus. The substance which forms the silk is in his stomach, which is very long, wound up, as it were, upon two spindles, as some say, and surrounded with a gum, commonly yellowish, sometimes white, but seldom greenish. When the worm spins his cocoon, he winds off a thread from each of his spindles, and joins them afterwards by means of two hooks which are placed in his mouth, so that the cocoon is formed of a double thread. Having opened a silk worm, you may take out the spindles, which are folded up in three plaits, and, on stretching them out, and drawing each extremity, you may extend them to near two ells in length. If you then scrape the thread so stretched out with your nail, you scrape off the gum, which is very like bees wax, and performs the same office to the silk it covers as gold leaf does to the ingot of silver it surrounds, when drawn out by the wire drawer. This thread, which is extremely strong and even, is about the thickness of a middling pin.

6
Particular attention ought to be paid to the breed of silk worms.

Of silk worms, as of most other animals, there is a considerable variety of breeds, some of which are much more hardy, and possess qualities considerably different from others. This is a particular of much importance to be adverted to at the time of beginning to breed these creatures in any place; for it will make a great difference in the profit on the whole to the undertaker if he rears a good or a bad sort (A). This is a department in respect to the economy of animals that has been in every

(A) As the success of the silk manufacture must depend on the breed of worms, it is of great consequence to bring them from those countries where they are reckoned best.

Mr Andrew Wright, an ingenious silk manufacturer of Paisley, has given the following directions for conveying the eggs of the silk worm from distant countries by sea: As soon as the moth has laid her eggs, dry them immediately, and put them into glass phials; seal them so close that damp air or water will not penetrate into them. Put these phials that contain the eggs into earthen pots filled with cold water; and as often as the water becomes warm

Silk. every cafe much lefs adverted to than it deferves; and in particular with regard to the filk worm it has been almoft entirely overlooked. A few eggs of the filk worm can be eafily tranfported by poft in a letter from any part of Europe to another, efpecially during the winter feafon. It would therefore be an eafy matter for any patriotic fociety, fuch as the Society of Arts in London, to obtain a fpecimen of the eggs from every country in which filk is now reared, to put thefe under the care of a perfon who could be depended upon, and who underftood the management of them, with orders to keep each kind diftinct from another, and advert to every particular that occurred in their management, fo as to make a fair eftimate of their refpective merits. By thefe means the beft might be felected, and thofe of inferior value rejected. Forty or fifty of each fort might be enough for the experiment; but it ought to be repeated feveral times before conclufions could be drawn from it that might be altogether relied upon; for it is well known that a variation of circumftances will make a change in the refult; and it is by no means certain that the fame particular would affect thofe of one breed exactly in the fame manner as it would do thofe of a different breed. One may be more hardy with regard to cold, another more delicate in refpect to food, and fo on. It is experience alone that can afcertain the circumftances here inquired for.

7 The management of filk worms muft be different in different climates;

From the above-mentioned particulars, it is evident, that the management of filk worms muft be very different in hot climates from what is required in thofe that are colder. At Madras, it appears from Dr Anderfon's experiments that it is very difficult to prevent the eggs from hatching for a very few days, fo that many generations of them muft be propagated in one year. "In this hotteft feafon," fays he, in a letter to Sir Jofeph Banks, dated July 6. 1791, "the fhorteft time I have been able to remark for the whole evolutions of the filk worm is 40 days; that is to fay, fix days an egg, 22 a worm, 11 a grub in the cocoon, and one a moth or butterfly." Fortunately, where the climate forces forward their production fo rapidly, nature hath been equally provident of food for their fubfiftence; for in thefe regions the mulberry continues to grow and pufh out leaves throughout the whole year.

8 but may be eafily reared in temperate climes.

Though the filk worm be a native of China, there is no doubt but it might eafily be propagated perhaps in moft parts of the temperate zones. The eggs of this infect, indeed, require a confiderable degree of warmth to hatch them, but they can alfo endure a fevere froft. No lefs than 5400lbs of filk were raifed in 1789 in the cold, fandy territories of Pruffia. In the province of Pekin, in China, where great quantities of filk are fabricated, the winter is much colder than even in Scotland. From the information of fome Ruffians who were fent thither to learn the Chinefe language, we find that Reaumur's thermometer was obferved from 10 to 15, and even 20 degrees below the freezing point. Nor is it difficult to rear the food of the filk worm in a temperate clime. The mulberry-tree is a hardy vegetable, which bears, without injury, the winters of Sweden, and even of Siberia. Of the feven fpecies of the mulberry (fee MORUS) enumerated by Linnæus, four of thefe (viz. the white, red, black, and Tartarian), there is every reafon to believe could be reared both in Britain and Ireland. The *white* grows in Sweden; the *red* is abundant round Quebec; the *black* delights in bleak fituations, expofed to wind on the fea fhore; and the *Tartarian* mulberry is reprefented as growing in the chilly regions of Siberia.

Bee, N° 156.

9 Whether any fpecies of mulberry tree be fuperior to others.

As to the fuperior qualities of the different fpecies, probably there is very little to be pointed out amongft the four juft mentioned with regard to nourifhment, except what may be drawn from the following fact: that if the firft three are laid down together, the filk worm will firft eat the white, then the red, and next the black, in the order of the tendernefs of the leaves. The Tartarian feems to hold as high a place in its efteem as either the red or black; but all muft yield to the white, which feems to be its natural food.

In Calabria the red mulberry is ufed; in Valencia the white; and in Granada, where excellent filk is produced, the mulberries are all black. The white feems to profper very well in a moift ftiff foil: the black agrees well with a dry, fandy, or gravelly foil; and the white is moft luxuriant in a moift rich loam.

10 Britain poffeffes fome advantages over warmer countries for raifing filk.

It may juftly be afferted, that Britain poffeffes fome advantages in the raifing of raw filk which are not enjoyed by warmer countries. Even in the fouth of France, Mr Arthur Young informs us, the mulberry leaves are often nipped by froft in the bud; but this is fcarcely ever the cafe with us. It is well known that thunder and lightning are hurtful to the filk worm. Now our climate can boaft that it is almoft wholly exempted from thofe dreadful ftorms of thunder and lightning which prevail fo much in hot climates. Nature has then furnifhed us with every thing requifite for the filk manufacture; it remains only for us to improve the advantages which we poffefs. Let mulberry trees be planted by proprietors of lands, and let a few perfons of fkill and attention devote their time to the raifing of filk worms. This is an employment that will not interfere with any manufacture already eftablifhed; on the contrary, it would afford a refpectable, a lucrative, and agreeable employment to ladies, or to females in general, who have at prefent too few profeffions to which they can apply. The fociety inftituted at London for the encouragement of arts, manufactures, and commerce, much to their honour, have offered premiums to thofe who fhall plant a certain number of mulberry trees.

11 Method of raifing mulberry-trees in the fouth of France.

The following method of raifing mulberry trees from feed is practifed in the fouth of France, and has been repeated with fuccefs in the Eaft Indies by Dr Anderfon of Madras. "Take the ripe berries of the mulberry when it is full of juice and of feeds. Next take a rough horfe-hair line or rope, fuch as we dry linen on, and with a good handful of ripe mulberries run your hand along the line bruifing the berries and mafhing them

Letters on the Culture of Raw Silk on the Coaft of Coromandel.

---

warm renew it. Place the earthen veffels in the coldeft place of the fhip, and let them remain until the end of the voyage. It muft be obferved, that the fhip chofen for this purpofe ought to be one that would arrive in Britain in the months of June or July.

them as much as poffible as your hand runs along, fo that the pulp and feeds of the berries may adhere in great abundance to the rope or hair line. Next dig a trench in the ground where you wifh to plant them, much like what is practifed in kitchen gardens in England for crops of various kinds. Next cut the rope or hair line into lengths according to the length of the trench you think fit to make, and plunge the line full of mafhed berries into the trench, and then cover it over well with earth, always remembering afterwards to water it well, which is effential to the fuccefs. The feeds of the berries thus fown will grow, and foon fhoot out young fuckers, which will bear young leaves, which are the beft food for the filk worm.

"The facility and rapidity with which young leaves may by this means be produced is evident, for as many rows of trenches may thus be filled as can be wifhed; and it can never be neceffary to have mulberry trees higher than our rafpberries, currants, or goofeberry bufhes. Whenever they get beyond that, they lofe their value; and if thefe trenches fucceed, you may have a fupply coming frefh up day after day, or any quantity you pleafe." Thus abundance of thefe trees might be reared. But as mulberry trees are not yet found in abundance in this country, it were to be wifhed that fome other food could be fubftituted in their place: attempts have accordingly been made by thofe who have reared filk worms, and it has been found poffible to fupport the filk worm upon lettuce (B).

Bee, N° 70.

12 Mifs Rhodes fed filk worms on lettuce for fome time.

Mifs Henrietta Rhodes, a lady who has made fome fuccefsful experiments on raifing filk worms in England, had found that the filk worm could with fafety be kept on lettuce for fome time. This is pretty generally known by ladies who have turned their attention to this fubject; but fhe found that in general they could not with fafety be kept upon that food above three weeks. If longer fed upon that plant, the worms for the moft part die without fpinning a web at all. She found, however, that they did not always die, but that in fome cafes they produced very good cocoons, even when fed entirely on lettuce. She therefore with reafon fufpected that the death of the animal muft be occafioned by fome extraneous circumftance, and not from the poifonous quality of the food itfelf; the circumftance fhe fufpected, from fome incidental obfervations, was the coldnefs of that food; and therefore fhe thought it was not impoffible, but if they were kept in a very warm place, while fed on lettuce, they might attain, in all cafes, a due perfection.

13 General Mordaunt ftill more fuccefsful.

General Mordaunt having been informed of this conjecture, refolved to try the experiment. He got fome filk worms eggs, had them hatched in his hot-houfe, and caufed them to be all fed upon lettuce and nothing elfe. They profpered as well as any worms could do, few or none of them died; and they afforded as fine cocoons as if they had been fed upon mulberry leaves. As far as one experiment can go, this affords a very exhilarating profpect in many points of view. If one kind of food has been noxious, merely on account of an improper temperature, others may be found which have been hurtful only from a fimilar caufe; fo that it is not impoffible but we may at laft find that this delicate creature may be fupported by a variety of kinds of food. Few, however, could be more eafily obtained than lettuce; and this plant, when cabbaged (the cofs, or ice lettuce efpecially), would poffefs one quality that the mulberry leaf never can poffefs, from the want of which many millions of worms die in thofe countries where filk is now reared; for it is obferved, that when the leaves are gathered wet, it is fcarcely poffible to preferve the worms alive for any length of time; fo that during a continuance of rainy weather many of them are unavoidably cut off; but a lettuce, when cabbaged, refifts moifture. If gathered, even during rain, the heart of it is dry; fo that if the outer leaves be thrown afide at that time, the worms would be continued in perfect health. The expence, too, of cultivating and gathering lettuce, would be fo much lefs than that of gathering mulberry leaves, as to occafion a faving that would be much more than fufficient to counterbalance the expence of heating the confervatory, as a little reflection will fhow.

But the great point to be now afcertained is, whether it is a fact that worms fed on lettuce, if kept in a due temperature, will continue in good health, in general, till they fhall have perfected their cocoon? One experiment is too little to eftablifh this fact with perfect certainty. It would therefore be neceffary that more experiments fhould be made on this fubject.

14 Silk worms faid to be fed on dried mulberry leaves.

It is faid that Dr Lodovico Bellardi, a learned and ingenious botanift of Turin, has, after a number of experiments, difcovered a new method of feeding filk worms, when they are hatched before the mulberry trees have produced leaves, or when it happens that the froft deftroys the tender branches. This new method confifts in giving the worms dried leaves of the mulberry-tree, One would think that this dry nourifhment would not be much relifhed by thefe infects; but repeated experiments made by our author, prove that they prefer it to any other, and eat it with the greateft avidity. The mulberry leaves muft be gathered about the end of autumn, before the frofts commence, in dry weather, and at times when the heat is greateft. They muft be dried afterwards in the fun, by fpreading them upon large cloths, and laid up in a dry place after they have been reduced to powder. When it is neceffary to give this powder to the worms, it fhould be gently moiftened with a little water, and a thin coat of it muft be placed around the young worms, which will immediately begin to feed upon it.

15 Proper experiments ought to be made on various vegetables.

We have mentioned all the different kinds of food, which, as far as we have heard, have been tried with any fuccefs to nourifh the filk worm; not, however, with great confidence, but as experiments which it might be worth while carefully to confider and perform. We muft not omit to mention that one perfon, who has had much

(B) It is not improbable, fays Dr Anderfon, to whofe valuable work entitled the *Bee*, we have been much indebted in the drawing up of this article, that other kinds of food may be found which will anfwer the fame purpofe. The chicorium intybus and common endive might be tried, as they have the fame lactefcent quality with the lettuce.

Silk. much experience in the managing of silk worms, assures us, that the silk produced from any other food than mulberry leaves is of an inferior quality, and that the worms are sickly. We think, however, that there is reason to suspect that the experiment has not been skilfully performed; and therefore, before every other food except mulberry leaves is discarded, the experiment ought to be performed with more attention and care. We know that many animals in a domestic state can live upon food very different from that which supported them when running wild in the fields. Certain it is, however, that every animal, in its state of nature, partakes of a food peculiar to itself, which is rejected by other animals as if it were of a poisonous quality; and it may be mentioned as a curious fact, as well as an admirable instance of the care of that Being who feeds the fowls of heaven, that notwithstanding the numberless insects that prey upon animals and vegetables, the mulberry tree is left untouched by them all, as the exclusive property of the silk worm, the chief of the insect tribe, which toils and spins for the use of man.

16 What situation and apartments proper for these insects.

Having now considered the food proper for the silk worm, we shall next consider what situation is most favourable to them. In the opinion of some persons in this country who have been in the practice of rearing silk worms, they ought always to be kept in a dry place, well sheltered, and possessing a considerable degree of warmth, and which is not exposed to sudden transitions from heat to cold. If the weather be too cold, a small fire must be made: this is of most importance when the worms are ready for spinning. A southern exposure is therefore preferable. Some think light is of great utility to silk worms, others think that they thrive better in the dark. As to what apartments are best accommodated for promoting the health of silk worms, and most convenient for those who have the care of them, they may be various according to the extent of the manufacture or the wealth of the proprietors. Silk worms may be kept in boxes or in shelves. When shelves are to be used, they may be constructed in the following manner: The shelves may be of wicker, ranged at the distance of a foot and a half, and fixed in the middle of the room: their breadth ought to be such, that any person can easily reach to the middle from either side. This is perhaps the simplest and cheapest apparatus for rearing silk worms; but there is another apparatus which may be recommended to those who are anxious to unite some degree of elegance with convenience. This apparatus is the invention of the Rev. George Swayne of Puckle-church, a gentleman who has studied this subject much, in order to find out the way for promoting the culture of silk among the poor. This apparatus, with the description of it, may be found in the Transactions of the Society for encouraging Arts, Manufactures, and Commerce, vol. vii. p. 148.

17 Mr Swayne's apparatus described.

The apparatus consists of a wooden frame four feet two inches high, each side 16 inches and a half wide, divided into eight partitions by small pieces of wood which form grooves, into which the slides run, and are thus easily thrust into or drawn out of the frame. The upper slide in the model sent to the society by Mr Swayne is of paper only, and designed to receive the worms as soon as hatched; the two next are of catgut, the threads about one-tenth of an inch distant from each other: these are for the insects when a little advanced in size: the five lower ones are of wicker work; but, as Mr Swayne afterwards found, netting may be substituted with advantage instead of wicker bottoms. Under each of these, as well as under those of catgut, are sliders made of paper, to prevent the dung of the worms from falling on those feeding below them.

18 Proper time for hatching silk worms.

The management of silk worms is next to be attended to. The proper time for hatching them is when the leaves of the mulberry are full grown, or nearly so; that as soon as these insects are capable of receiving food they may obtain it in abundance. To attempt to hatch them sooner would be hurtful, as the weather would not be sufficiently warm. Besides, as leaves are necessary to the life of a vegetable, if the young leaves of the mulberry tree are cropped as soon as they are unfolded, the tree will be so much weakened as to be incapable of producing so many leaves as it would otherwise have done; and if this practice be frequently repeated, will inevitably be destroyed.

19 How they ought to be hatched and fed.

When the proper season is arrived, the eggs may be hatched either by the heat of the sun, when it happens to be strong enough, or by placing them in a small room moderately heated by a stove or fire; and after being exposed for six or seven days to a gentle heat, the silk worm issues from the egg in the form of a small black hairy caterpillar. When Mr Swayne's apparatus is used, the worms are to be kept on the drawers with paper bottoms till they are grown so large as not readily to creep through the gauze-bottomed drawers: they are then to be placed on those drawers, where they are to remain till their excrements are so large as not readily to fall through; when this is the case, they must be removed to the drawers with the wicker or netting bottoms, and fed thereon, till they show symptoms of being about to spin. It is scarcely necessary to mention, that the paper slides beneath the gauze and wicker drawers are intended to receive the dung, which should be emptied as often as the worms are fed, at least once a-day; or to direct, that when the worms are fed, the slides are to be first drawn out a considerable way, and the drawers to rest upon them.

20 Wet or damp food produces contagious diseases.

It has been already mentioned, that wet or damp food is exceedingly prejudicial to those insects. It produces contagious and fatal diseases. To prevent the necessity of giving them wet or damp food, attention ought to be paid to the weather, so that when there is an immediate prospect of rain, a sufficient quantity of leaves may be gathered to serve the worms two or three days. In this country, the leaves of the black or red mulberry tree may be preserved good for food, although kept four or five days, by the following method: When new gathered, lay them loosely in glazed earthen vessels, place these in a cold place, well aired, not exposed to drought.

21 Ought to be kept as clean as possible.

The utmost attention must be paid to preserve the place where silk worms are kept as clean as possible: the house or room must be well ventilated, that no noxious vapours be accumulated. By some experiments of M. Faujas de St Fond, which are recorded in his history of Languedoc, it appears that the silk worm is much injured by foul air. All decayed leaves must be removed from them, as it is now well known that they emit bad air in great abundance

One of the most difficult branches of the management of silk worms has hitherto been the cleaning without bruising

Silk.

Bee, N° 95.

bruifing them. To avoid this inconvenience, the peafants in France and Italy frequently allow the whole litter to remain without ever cleaning them, which is the caufe of that unwholefome ftench that has been fo often remarked by thofe who vifit the places for rearing filk worms in thefe countries.

22 How they may be cleaned without bruifing them.

This difficulty may be effectually removed by providing a net, or, what would be ftill better, a wire-bottomed frame, wrought into large mefhes like a riddle. Have that made of a fize exactly fufficient to cover the wooden box in which the worms are kept. When you mean to fhift them, fpread frefh leaves into the wire bafket; and let it down gently over the worms till it comes within their reach. They no fooner perceive the frefh food than they abandon the rubbifh below, and creep through the mefhes, fo as to fix themfelves upon the leaves; then by gently raifing the frefh bafket, and drawing out the board below (which ought to be made to flip out like the flip-bottom of a bird's cage), you get off all the excrements and decayed leaves, without incommoding the worms in the fmalleft degree; and along with the litter you will draw off an inch or two in depth of the fouleft mephitic vapours. To get entirely rid of thefe, the board, when thus taken out, fhould be carried without doors, and there cleaned; and the flip-board immediately replaced to receive all the excrements and offals. After it is replaced, the wire frame that had been elevated a little, may be allowed to defcend to a convenient diftance above the board without touching it. Thus will there be left a vacant fpace for the mephitic air to fall below the worms, fo as to allow them to inhabit a wholefome region of the atmofphere.

When a frefh fupply of food is to be given before cleaning, the wire frame ought to be let down as clofe to the board as can be fafely done, and another wire-bottomed frame put over it, with frefh leaves, as before defcribed. When the worms have abandoned that in their turn, let the flip-board, together with the lower wire frame, be drawn out and removed, and fo on as often as neceffary. To admit of this alternate change, every table, confifting of one flip-board, ought to have two fets of wire-bottomed frames of the fame fize; the flip-board to be always put into its place immediately after it is cleaned, and the wire frames referved to be afterwards placed over the other. By this mode of management, it is probable that the worms would be faved from the difeafes engendered by the mephitic air, and the numerous deaths that are the confequence of it avoided.

23 Quicklime would abforb all the bad air which furrounds them.

Dr Anderfon, to whom we have already acknowledged our obligations, and to whom this country has been much indebted for valuable works on agriculture, the fifheries, &c. advifes thofe who have the management of filk worms to ftrew a thin ftratum of frefh flaked quicklime upon the flip-board each time it is cleaned, immediately before it is put into its place. This would abforb the mephitic gas, for as foon as it is generated it would defcend upon the furface of the quicklime. Thus would the worms be kept continually in an atmofphere of pure air (c). Were the walls of the apartments to be frequently wafhed with quicklime and water, it would tend much to promote cleanlinefs at a fmall expence, and augment the healthinefs of the worms as well as that of the perfons who attend them.

24 Mr Swayne's receptacle for the worms, when going to fpin.

Tranfactions of the Society for the Encouragement of Arts, vol. viii. p. 123.

When the filk worm refufes its food, and leaves filky traces on the leaves over which it paffes, it is a proof that it is ready to begin its cocoon. It is now neceffary to form a new receptacle, which is commonly done by pinning together papers in the fhape of inverted cones with broad bafes. "This method (fays Mr Swayne), where there are many worms, is exceedingly tedious, waftes much paper, and ufes a large number of pins; befides, as the filk worm always weaves an outer covering or defenfive web before it begins the cocoon or oval ball, I apprehended that it caufed a needlefs wafte of filk in forming the broad web at the top. The method I make ufe of is, to roll a fmall piece of paper (an uncut octavo leaf, fuch as that of an old magazine, is fufficient for three), round my fore-finger, and to give it a twift at the bottom; which is done with the utmoft expedition, and gives no occafion for the ufe of pins. Thefe rolled paper-cafes being likewife of a form more nearly refembling that of a cocoon, with a much narrower opening on the top than the others, takes away the neceffity of wafting much filk in the outer web, and confequently leaves more to be employed in forming the ball. The filk is readily taken out of thefe cafes by untwifting the bottom; and if this be done with moderate care, and the papers are preferved, they will ferve feveral times for the like purpofe."

25 Others recommend bufhes of heath.

Others advife, that when the filk worms are preparing to fpin, little bufhes of heath, broom, or twigs, fhould be

(c) To put this queftion beyond a doubt, Mr Blancard made the following comparative experiments, which were feveral times repeated. "I procured (fays he) four glafs jars nine inches high and five in diameter, clofing the mouth with cork ftoppers. After which I placed in each of them, in their fecond life (fo *mue* may be tranflated, which means the ftage between the different fickneffes), twelve filk worms, which were fed four times a-day; and which I confined in this kind of prifon all their life, without taking away either their dead companions or their ordure or litter. I fprinkled with chalk the worms of only two of thefe jars, and kept the two others to compare with them.

"In thofe without lime, I never obtained either more or lefs than three fmall and imperfect cocoons (*chiques ou bouffard*), and in the two that were fprinkled with lime, I had very often twelve, and never lefs than nine fine full-fized firm cocoons."

This experiment affords the moft fatisfactory proof of the utility of this procefs. From a number of trials he found, that even when the worms were covered with a large proportion of lime, they never were in any way incommoded by it.

Silk.

be ſtuck upright near the ſhelf or box in which they are incloſed: the worms mount theſe, and attach their web to them.

26
How ſilk worms may be revived when affected by thunder.
Tranſactions of the American Philoſophical Society, vol. ii.

When the worms are ready to mount, in order to ſpin, if the weather be hot, attended with thunder, you will ſee them in a languiſhing condition; your care muſt then be to revive them, which is effected thus: Take a few eggs and onions, and fry them in a pan with ſome ſtale hog's lard, the ranker the better, and make pancake; which done, carry it ſmoaking hot into the room where they are kept, and go round the chamber with it. You will be ſurpriſed to ſee how the ſmell revives them, excites thoſe to eat who have not done feeding, and makes the others that are ready to ſpin climb up the twigs.

27
Different kinds of cocoons.

In about ten or twelve days, according to the accounts which we have received from Mr Andrew Wright of Paiſley, it may be ſafely concluded, that if the worms have finiſhed their work, the cocoons may be collected.

We ſhall now diſtinguiſh the cocoons from one another according to their value or their uſe, and conſider the method of managing each. They may be diſtinguiſhed into the good and bad. The good cocoons may be known by theſe marks: they are little, ſtrong, and firm; have a fine grain, both ends are round, and they are free from ſpots. Among the good cocoons alſo may be arranged thoſe which are called *calcined* cocoons, in which the worm, in conſequence of ſickneſs, is petrified or reduced to a fine powder. Theſe cocoons produce more ſilk than others, and are ſold in Piedmont at half as much again. They may be diſtinguiſhed by the noiſe which the worm makes when the cocoon is ſhaken. Of the bad cocoons there are ſix ſpecies: 1. The *pointed cocoons*, one extremity of which ends in a point; the ſilk which covers the point is weak, and ſoon breaks or tears. 2. The *cocalons*, which are bigger, but the contexture is weak. 3. The *dupions*, or double cocoons, which have been formed by the joint labour of two and ſometimes of three worms. 4. The *ſoufflons*, which have a looſe contexture, ſometimes ſo looſe that they are tranſparent. 5. The *perforated cocoons*, which have a hole at one end. 6. The *bad choquette*, which is compoſed of defective cocoons, ſpotted or rotten. Beſides theſe there is the *good choquette*, which does not properly belong to either of theſe two claſſes: it is formed of thoſe cocoons in which the worm dies before the ſilk is brought to perfection. The worms adhere to one ſide of the cocoon, and therefore when the cocoon is ſhaken will not rattle: the ſilk is as fine, but is not of ſo bright a colour, nor is ſo ſtrong and nervous, as that which is obtained from good cocoons.

28
Mr Wright's inſtructions for ſelecting and preſerving the royal cocoons.

The cocoons which are kept for breeding are called *royal* cocoons. For ſelecting and preſerving theſe, we have been favoured with ſome valuable inſtructions by Mr Wright of Paiſley, which we ſhall preſent to our readers.—The largeſt and beſt cocoons ought to be kept for breed, about an equal number of males and females; the cocoons that contain the former are ſharper pointed at the ends than thoſe that contain the latter. Although it ſhould happen that there are more females than males, little inconvenience or ill conſequences can ariſe from it, as one male will ſerve two or three females, if the time of their coming out of the cocoons anſwer. About 12 or 15 days after they begin to ſpin, the cocoons for breed may be laid on ſheets of white paper; about this time the moth opens for itſelf a paſſage through the end of its cocoon, and iſſues out. When the female has laid her eggs, which on an average may amount to 250, they are ſpread upon ſheets of paper and hung up to dry in ſome place where they may not be expoſed to the heat of the ſun: after being dried they muſt be kept in a cool well-aired place, where neither vapours nor moiſture can reach them. That they may be preſerved from external accidents, as inſects of different kinds will deſtroy them, and mice is their enemy in all the ſtages of their exiſtence, they ſhould be kept in ſtone pots or glaſs bottles with their mouths ſtopped, and there remain until brought out next ſeaſon to be hatched.

29
How to prepare the cocoons for being wound.
Tranſactions of the American Philoſophical Society, vol. ii.

The cocoons from which the ſilk is to be immediately wound muſt be expoſed to the heat of an oven, in order to kill the chryſalis or aurelia, which would otherwiſe eat its way through the cocoon, and render it uſeleſs. The following directions are given for managing this proceſs by one of the firſt ſilk manufactures in Italy.

Put your cocoons in long ſhallow baſkets, and fill them within an inch of the top. You then cover them up with paper, and put a wrapper over that. Theſe baſkets are to be diſpoſed in an oven, whoſe heat is as near as can be that of an oven from which the bread is juſt drawn after being baked. When your cocoons have remained therein near an hour, you muſt draw them out; and to ſee whether all the worms are dead, draw out a dupion from the middle of your baſket and open it: if the worm be dead, you may conclude all the reſt are ſo; becauſe the contexture of the dupion being ſtronger than that of the other cocoons, it is conſequently leſs eaſy to be penetrated by the heat. You muſt obſerve to take it from the middle of the baſket, becauſe in that part the heat is leaſt perceptible. After you have drawn your baſkets from the oven, you muſt firſt cover each of them with a woollen blanket or rug, leaving the wrapper beſides, and then you pile them above one another. If your baking has ſucceeded, your woollen cover will be all over wet with a kind of dew, the thickneſs of your little finger. If there be leſs, it is a ſign your cocoons have been too much or too little baked. If too much baked, the worm, being over-dried, cannot tranſpire a humour he no longer contains, and your cocoon is then burnt. If not enough baked, the worm has not been ſufficiently penetrated by the heat to diſtil the liquor he contains, and in that caſe is not dead.

You muſt let your baſkets ſtand thus covered five or ſix hours if poſſible, in order to keep in the heat, as this makes an end of ſtifling thoſe worms which might have avoided the firſt impreſſion of the fire. You are likewiſe to take great care to let your cocoons ſtand in the oven the time that is neceſſary; for if they do not ſtand long enough, your worms are only ſtunned for a time and will afterwards be revived. If, on the other hand, you leave them too long in the oven, you burn them many inſtances of theſe two caſes are frequently to be met with. It is a good ſign when you ſee ſome of the butterflies flying out from the cocoons which have been baked, becauſe you may be certain they are not burnt. For if you would kill them all to the laſt worm, you would burn many cocoons which might be more expoſed to the heat than that particular worm.

The next operation is the winding of the ſilk. Before you begin to wind, you muſt prepare your cocoons as follows:

50 How the ſilk is to be wound from the cocoons.

1. In ſtripping them of that waſte ſilk that ſurrounds them, and which ſerved to faſten them to the twigs. This burr is proper to ſtuff quilts, or other ſuch uſes; you may likewiſe ſpin it to make ſtockings, but they will be coarſe and ordinary.

2. You muſt ſort your cocoons, ſeparating them into different claſſes in order to wind them apart. Theſe claſſes are, the good white cocoons; the good cocoons of all the other colours; the dupions; the cocalons, among which are included the weak cocoons; the good choquette; and, laſtly, the bad choquette. In ſorting the cocoons, you will always find ſome perforated cocoons amongſt them, whoſe worm is already born; thoſe you muſt ſet apart for fleuret. You will likewiſe find ſome ſoufflons, but very few; for which reaſon you may put them among the bad choquette, and they run up into waſte.

The good cocoons, as well white as yellow, are the eaſieſt to wind; thoſe which require the greateſt care and pains are the cocalons; you muſt wind them in cooler water than the others, and if you take care to give them to a good windſter, you will have as good ſilk from them as the reſt. You muſt likewiſe have careful windſters for the dupions and choquettes. Theſe two ſpecies require hotter water than the common cocoons.

The good cocoons are to be wound in the following manner: Firſt, chooſe an open convenient place for your filature, the longer the better, if you intend to have many furnaces and coppers. The building ſhould be high and open on one ſide, and walled on the other, as well to ſcreen you from the cold winds and receive the ſun, as to give a free paſſage to the ſteam of your baſons or coppers.

Theſe coppers or baſons are to be diſpoſed (when the building will admit of it) in a row on each ſide of the filature, as being the moſt convenient method of placing them, for by that means in walking up and down you ſee what every one is about. And theſe baſons ſhould be two and two together, with a chimney between every couple.

Having prepared your reels (which are turned by hands, and require a quick eye), and your fire being a light one under every baſon, your windſter muſt ſtay till the water is as hot as it can be without boiling. When every thing is ready, you throw into your baſons two or three handfuls of cacoons, which you gently bruſh over with a wiſk about ſix inches long, cut ſtumpy like a broom worn out: by theſe means the threads of the cocoons ſtick to the wiſk. You muſt diſengage theſe threads from the wiſk, and purge them by drawing theſe ends with your fingers till they come off entirely clean. This operation is called *la Battue.*

When the threads are quite clear, you muſt paſs four of them (if you will wind fine ſilk) through each of the holes in a thin iron bar that is placed horizontally at the edge of your baſon; afterwards you twiſt the two ends (which conſiſt of four cocoons each) twenty or twenty-five times, that the four ends in each thread may the better join together in croſſing each other, and that your ſilk may be plump, which otherwiſe would be flat.

Your windſter muſt always have a bowl of cold water by her, to dip her fingers in, and to ſprinkle very often the ſaid bar, that the heat may not burn the thread.

Your threads, when thus twiſted, go upon two iron hooks called rampins, which are placed higher, and from thence they go upon the reel. At one end of the axis of the reel is a cog-wheel, which catching in the teeth of the poſt-rampin, moves it from the right to the left, and conſequently the thread that is upon it; ſo that your ſilk is wound on the reel croſsways, and your threads form two hanks of about four fingers broad.

As often as the cocoons you wind are done, or break or diminiſh only, you muſt join freſh ones to keep up the number requiſite, or the proportion; becauſe, as the cocoons wind off, the thread being finer, you muſt join two cocoons half wound to replace a new one: Thus you may wind three new ones and two half wound, and your ſilk is from four to five cocoons.

When you would join a freſh thread, you muſt lay one end on your finger, which you throw lightly on the other threads that are winding, and it joins them immediately, and continues to go up with the reſt. You muſt not wind off your cocoons too bare or to the laſt, becauſe when they are near at an end, the *bairré*, that is, the huſk, joins in with the other threads, and makes the ſilk foul and gouty.

When you have finiſhed your firſt parcel, you muſt clean your baſons, taking out all the ſtriped worms, as well as the cocoons, on which there is a little ſilk, which you firſt open and take out the worm, and then throw them into a baſket by you, into which you likewiſe caſt the looſe ſilk that comes off in making the battue.

You then proceed as before with other two or three handfuls of cocoons; you make a new battue; you purge them, and continue to wind the ſame number of cocoons or their equivalent, and ſo to the end.

As was already mentioned, the windſter muſt always have a bowl of cold water by her, to ſprinkle the bar, to cool her fingers every time ſhe dips them in the hot water, and to pour into her baſon when neceſſary, that is, when her water begins to boil. You muſt be very careful to twiſt your threads a ſufficient number of times, about 25, otherwiſe your ſilk remains flat, inſtead of being round and full; beſides, when the ſilk is not well croſſed, it never can be clean, becauſe a gout or nub that comes from a cocoon will paſs through a ſmall number of theſe twiſts, though a greater will ſtop it. Your thread then breaks, and you paſs what foulneſs there may be in the middle of your reel between the two hanks, which ſerves for a head-band to tie them.

You muſt obſerve that your water be juſt in a proper degree of heat. When it is too hot, the thread is dead, and has no body; when it is too cold, the ends which form the thread do not join well, and form a harſh ill-qualified ſilk.

You muſt change the water in your baſon four times a day for your dupions and choquette, and twice only for good cocoons when you wind fine ſilk; but if you wind coarſe ſilk, it is neceſſary to change it three or four times. For if you were not to change the water, the ſilk would not be ſo bright and gloſſy, becauſe the worm contained

contained in the cocoons foul it very confiderably. You muft endeavour to wind as much as poffible with clear water, for if there are too many worms in it, your filk is covered with a kind of duft which attracts the moth, and deftroys your filk.

You may wind your filk of what fize you pleafe, from one cocoon to 1000; but it is difficult to wind more than 30 in a thread. The nicety, and that in which confifts the greateft difficulty, is to wind even; becaufe as the cocoon winds off the end is finer, and you muft then join other cocoons to keep up the fame fize. This difficulty of keeping the filk always even is fo great, that (excepting a thread of two cocoons, which we call fuch) we do not fay a filk of three, of four, or fix cocoons; but a filk of three to four, of four to five, of fix to feven cocoons. If you proceed to a coarfer filk, you cannot calculate fo nicely as to one cocoon more or lefs. We fay, for example, from 12 to 15, from 15 to 20, and fo on.

31 What number of worms produce a certain quantity of filk.

What number of worms are neceffary to produce a certain quantity of filk has not been afcertained. And as different perfons who wifhed to determine this point have had different refults, the truth feems to be, that from various circumftances the fame number of worms may produce more filk at one time than at another. It is related in the fecond volume of the Tranfactions of the Society for encouraging Arts, &c. that Mrs Williams obtained nearly an ounce and a half of filk from 244 cocoons. Mr Swayne from 50 cocoons procured 100 grains. Mifs Rhodes obtained, from 250 of the largeft cocoons, three quarters of an ounce and a dram. From a paper in the fecond volume of the American Tranfactions, which we have before referred to in the courfe of this article, we are informed that 150 ounces of good cocoons yield about 11 ounces of filk from five to fix cocoons: if you wind coarfer, fomething more. But what appears aftonifhing, Mr Salvatore Bertezen, an Italian, to whom the Society for encouraging Arts, &c adjudged their gold medal, raifed five pounds of excellent filk from 12,000 worms.

32 Length of the threads.

The cocoons produce a thread of very unequal length; you may meet with fome that yield 1200 ells, whilft others will fcarcely afford 200 ells. In general, you may calculate the production of a cocoon from 500 to 600 ells in length.

SILK-Loom. See WEAVING.

SILK Worm. See SILK.

SILLA, a large town on the Niger, by which the travels of Mr Park were bounded towards the eaft. He gives no particular defcription of the place, which his health and fpirits permitted him not to furvey, but affigns the reafons by which he was induced to proceed no farther. On his arrival, he was allowed to remain under a tree, till it was quite dark, furrounded by hundreds of people. But their language was extremely different from the other parts of Bambarra; and he was given to underftand, that in his progrefs eaftward, the Bambarra tongue was very little underftood; and that, on his reaching Jenné, he would find the greater part of the inhabitants accuftomed to fpeak a different language. He had now become the prey of ficknefs, exhaufted with hunger and fatigue, half naked, and without any article of value, to procure for himfelf provifions, clothes, or lodging, on which account he refolved to return, finding that to profecute his journey further in that direction was wholly impracticable. Silla, according to the lateft map of Africa, is in 14° 48′ N. Lat. and 1° 24′ W. Long.

SILPHA, CARRION-BEETLE, a genus of infects belonging to the order *coleoptera*. See ENTOMOLOGY *Index*.

SILPHIUM, a genus of plants belonging to the clafs of fyngenefia, and to the order of polygamia neceffaria; and in the natural fyftem arranged under the 49th order, *compofitæ*. See BOTANY *Index*.

SILVER, a well known metallic fubftance. For an account of its properties, fee CHEMISTRY *Index*.

SILVER, Ores of. See MINERALOGY *Index*.

Shell-SILVER, is prepared of the fhreds of filver leaf, or of the leaves themfelves, for the ufe of painters, after the fame manner as fhell gold. See *Shell GOLD*.

SILVERING, the covering of any thing with filver. It is ufual to filver metals, wood, paper, &c. which is performed either with fire, oil, or fize. Metal-gilders filver by the fire; painter gilders all the other ways. See GILDING.

To filver copper or brafs. 1. Cleanfe the metal with aquafortis, by wafhing it lightly, and immediately throwing it into pure water; or by heating it red-hot, and fcouring it with falt and tartar, and pure water, with a fmall wire brufh. 2. Diffolve fome filver in aquafortis, in a broad-bottomed glafs veffel, or of glazed earth; then evaporate away the aquafortis over a chaffing difh of coals. 3. Put five or fix times its quantity of water, or as much as will be neceffary to diffolve it perfectly, on the remaining dry calx; evaporate this water with the like heat; then put more frefh water, and evaporate again; and, if need be, the third time, making the fire towards the latter end fo ftrong as to leave the calx perfectly dry, which, if your filver is good, will be of a pure white. 4. Take of this calx, common falt, cryftals of tartar, of each a like quantity or bulk, and mixing well the whole compofition, put the metal into pure water, and take of the faid powder with your wet fingers, and rub it well on, till you find every little cavity of the metal fufficiently filvered over. 5. If you would have it richly done, you muft rub on more of the powder; and, in the laft place, wafh the filvered metal in pure water, and rub it hard with a dry cloth.

SILVERING of Glaffes. See *FOLIATING of Looking-glaffes*.

SILURIS, a genus of fifhes belonging to the order abdominales. See ICHTHYOLOGY *Index*.

SIMANCAS, a village on the eaftern boundary of the kingdom of Leon in Spain, fix miles below Valladolid, on the river Gifnerga. Dr Robertfon, in the introduction to his Hiftory of America, makes mention of it, and it is remarkable for the archives of the kingdoms of Leon and Caftile, kept in the caftle. This collection was begun when the kings often refided at Valladolid, in which city is ftill the civil and military tribunal for almoft the whole of Spain to the north of the Tagus. It was thought proper to have thofe papers kept in the vicinity of that court, for which purpofe this caftle was peculiarly fitted, being entirely erected of ftone. At one period there were two large halls in this office filled with papers refpecting the firft fettlement of the Spaniards in South America. There was likewife in the room called the *ancient royal patronage*, a box containing

containing treaties with England, in which are many letters and treaties between the kings of England and Spain, from the year 1400 to 1600. There was alfo a ftrong box in the fame archives, with five locks, which, we are told, has not been opened fince the time of Philip II. and it is fuppofed that it contains the procefs againft Philip's fon Prince Charles. But it appears that fome of the ftate papers have been removed to Madrid.

SIMEON *of Durham*, the cotemporary of William of Malmfbury, took great pains in collecting the monuments of our hiftory, efpecially in the north of England, after they had been fcattered by the Danes. From thefe he compofed a hiftory of the kings of England, from A. D. 616 to 1130; with fome fmaller hiftorical pieces. Simeon both ftudied and taught the fciences, and particularly the mathematics at Oxford; and became precentor of the church at Durham, where he died, probably foon after the conclufion of his hiftory, which was continued by John, prior of Hexham, to A. D. 1156.

SIMIA, the Monkey, a genus of quadrupeds belonging to the clafs of mammalia, and order of primates, in the Linnæean fyftem, but by Mr Pennant arranged under the digitated quadrupeds. See Mammalia *Index*.

SIMILE, or Similitude, in *Rhetoric*, a comparifon of two things, which though different in other refpects, yet agree in fome one. The difference between a fimile and comparifon is faid to confift in this, that the fimile properly belongs to whatever we call the quality of a thing, and the comparifon to the quantity. See Comparison; and Oratory, N° 118.

SIMILOR, a name given to an alloy of red copper and zinc, made in the beft proportions, to imitate filver and gold.

SIMON Maccaceus, a celebrated leader and highprieft of the Jews, who, after rendering the moft important fervices to his country, was at laft treacheroufly flain by his fon-in-law. See *the Hiftory of the Jews*, N° 15.

Simon Magus, or the Sorcerer, was a native of Gitton, a village of Samaria. According to the ufual practice of the Afiatics of that age, he vifited Egypt, and there probably became acquainted with the fublime myfteries taught in the Alexandrian fchool, and learned thofe theurgic or magical operations, by means of which it was believed that men might be delivered from the power of evil demons. Upon his return into his own country, the author of the Clementine Recognitions relates, that he impofed upon his countrymen by high pretenfions to fupernatural powers. And St Luke attefts, that this artful fanatic, ufing forcery, had bewitched the people of Samaria, giving out that he was *fome great one*; and that he obtained fuch general attention and reverence in Samaria, that the people all gave heed to him from the leaft to the greateft, faying, "This man is the great power of God."

Enfield's Hiftory of Philofophy, vol. ii. p. 161.

By the preaching of Philip the Deacon, he was with other Samaritans converted to the Chriftian faith, and admitted into the infant church by the ordinance of baptifm. His converfion, however, feems not to have been real; for, upon feeing the miraculous effects of the laying on of the apoftle's hands, he offered them money, faying, "Give me alfo this power, that on whomfoever I lay hands he may receive the Holy Ghoft." He probably thought Peter and John magicians like himfelf, but better fkilled in the art of deceiving the multitude.

Being fharply reproved for this impiety, he feems by his anfwer to have been made fenfible of his fin; but his repentance, if fincere, was of fhort duration. Returning to his former practices of impofture, he travelled through various provinces of the empire, oppofing the progrefs of the gofpel; and arriving at Rome, he led aftray vaft numbers of people by his pretended miracles. How long he lived in that metropolis of the world, or in what manner he died, we have no accounts that can be fully depended on. The Chriftian writers tell us, that being raifed in the air by two dæmons, he was deprived of their fupport by the prayers of St Peter and St Paul, and falling, broke his legs. By fome he is thought to have been the perfon mentioned by Suetonius, who, undertaking to fly in the prefence of Nero, fell to the ground with fuch violence, that his blood fpurted up to the gallery where the emperor was fitting,

The fum of this impoftor's doctrine, divefted of allegory, was, that from the Divine Being, as a fountain of light, flow various orders of æons, or eternal natures, fubfifting within the plenitude of the divine effence; that beyond thefe, in the order of emanation, are different claffes of intelligences, among the loweft of which are human fouls; that matter is the moft remote production of the emanative power, which, on account of its infinite diftance from the Fountain of Light, poffeffes fluggifh and malignant qualities, which oppofe the divine operations, and are the caufe of evil; that it is the great defign of philofophy to deliver the foul from its imprifonment in matter, and reftore it to that divine light from which it was derived; and that for this purpofe God had fent him one of the firft æons among men. To his wife Helena he alfo afcribed a fimilar kind of divine nature, pretending that a female æon inhabited the body of this woman, to whom he gave the name of Εννοια, *Wifdom*; whence fome Chriftian fathers have faid, that he called her the *Holy Spirit*. He alfo taught the tranfmigration of fouls, and denied the refurrection of the body.

Simon, *Richard*, was born at Dieppe the 15th May 1638. He began his ftudies among the priefts of the Oratory in that city, but quitted their fociety in a fhort time. From Dieppe he went to Paris, where he made great progrefs in the ftudy of the oriental languages. Some time afterwards he joined the fociety of the Oratory again, and became a prieft of it in 1660. In 1670 he publifhed fome pieces of a fmaller kind. In 1678 his Critical Hiftory of the Old Teftament appeared, but was immediately fuppreffed by the intrigues of Meffieurs du Port Royal. It was reprinted the year after, and its excellence foon drew the attention of foreigners; an edition of it was accordingly publifhed at Amfterdam in Latin, and at London in Englifh.

He died at Dieppe in 1712, at the age of 74.

He certainly poffeffed a vaft deal of learning: his criticifm is exact, but not always moderate; and there reigns in his writings a fpirit of novelty and fingularity which raifed him a great many adverfaries. The moft celebrated of thefe were Le Clerc, Voffius, Jurieu, Du Pin, and Boffuet. Simon wrote an anfwer to moft of the

the books that were publifhed againft him, and difplays a pride and obftinacy in his controverfial writings which do him little honour.

He was the author of a great many books. The following are the principal: 1. The Ceremonies of the Jews, tranflated from the Italian of Leo of Modena, with a fupplement concerning the fects of the Carraites and Samaritans. 2. *L'Hiftoire Critique du Vieux Teftament*, "The Critical Hiftory of the Old Teftament." This is a very important work, and deferves the attention of every clergyman. He fometimes, however, deviates from the road of integrity, to ferve the caufe of the church of Rome, particularly in his endeavours to prove the uncertainty of the Hebrew language. Thefe paffages have been very juftly expofed and confuted by Dr Campbell, in his ingenious Preliminary Differtations to his new Tranflation of the Gofpels. 3. Critical Hiftory of the Text of the New Teftament. 4. Critical Hiftory of the Verfions of the New Teftament. 5. Critical Hiftory of the principal Commentators on the New Teftament. 6. Infpiration of the Sacred Books. 7. A tranflation of the New Teftament. This book was cenfured by Cardinal Noailles and Boffuet. 8. The Hiftory of the rife and progrefs of Ecclefiaftical Revenues, which is commended by Voltaire, as is his Critical Hiftory of the Old Teftament. It refulted from a quarrel with a community of Benedictines. 9. A new felect Library, which points out the good books in various kinds of literature, and the ufe to be made of them. 10. Critical Hiftory of the Belief and Cuftoms of the Nations on the Levant. 11. Critical Letters, &c.

SIMONICAL, is applied to any perfon guilty of fimony. See SIMONY.

SIMONIDES, the name of feveral poets celebrated in antiquity; but by the Marbles it appears that the eldeft and moft illuftrious of them was born in the 55th Olympiad, 538 years B. C. and that he died in his 90th year; which nearly agrees with the chronology of Eufebius. He was a native of Ceos, one of the Cyclades, in the neighbourhood of Attica, and the preceptor of Pindar. Both Plato and Cicero give him the character not only of a good poet and mufician, but fpeak of him as a perfon of great virtue and wifdom. Such longevity gave him an opportunity of knowing a great number of the firft characters in antiquity with whom he was in fome meafure connected. It appears in Fabricius, from ancient authority, that Simonides was cotemporary and in friendfhip with Pittacus of Mitylene, Hipparchus tyrant of Athens, Paufanias king of Sparta, Hiero tyrant of Syracufe, with Themiftocles, and with Alevades king of Theffaly. He is mentioned by Herodotus; and Xenophon, in his Dialogue upon Tyranny, makes him one of the interlocutors with Hiero king of Syracufe. Cicero alleges, what has often been quoted in proof of the modefty and wifdom of Simonides, that when Hiero afked him for a definition of God, the poet required a whole day to meditate on fo important a queftion: at the end of which, upon the prince putting the fame queftion to him a fecond time, he afked two days refpite; and in this manner always doubled the delay each time he was required to anfwer it; till at length, to avoid offending his patron by more difappointments, he frankly confeffed that he found the queftion fo difficult, that the more he meditated upon it, the lefs was his hope of being able to folve it.

In his old age, perhaps from feeing the refpect which money procured to fuch as had loft the charms of youth and the power of attaching mankind by other means, he became fomewhat mercenary and avaricious. He was frequently employed by the victors at the games to write panegyrics and odes in their praife, before his pupil Pindar had exercifed his talents in their behalf: but Simonides would never gratify their vanity in this particular, till he had firft tied them down to a ftipulated fum for his trouble; and upon being upbraided for his meannefs, he faid, that he had two coffers, in one of which he had for many years put his pecuniary rewards; the other was for honours, verbal thanks, and promifes; that the firft was pretty well filled, but the laft remained always empty. And he made no fcruple to confefs, in his old age, that of all the enjoyments of life, the love of money was the only one of which time had not deprived him.

He was frequently reproached for this vice; however, he always defended himfelf with good humour. Upon being afked by Hiero's queen, Whether it was moft defirable to be learned or rich? he anfwered, that it was far better to be rich; for the learned were always dependent on the rich, and waiting at their doors; whereas, he never faw rich men at the doors of the learned. When he was accufed of being fo fordid as to fell part of the provifions with which his table was furnifhed by Hiero, he faid he had done it in order "to difplay to the world the magnificence of that prince and his own frugality." To others he faid, that his reafon for accumulating wealth was, that "he would rather leave money to his enemies after death, than be troublefome to his friends while living."

He obtained the prize in poetry at the public games when he was fourfcore years of age. According to Suidas, he added four letters to the Greek alphabet; and Pliny affigns to him the eighth ftring of the lyre; but thefe claims are difputed by the learned.

His poetry was fo tender and plaintive, that he acquired the cognomen of *Melicertes*, "fweet as honey;" and the tearful eye of his mufe was proverbial. Dionyfius places him among thofe polifhed writers who excel in a fmooth volubility, and flow on like plenteous and perennial rivers, in a courfe of even and uninterrupted harmony.

It is to Dionyfius that we are indebted for the prefervation of the following fragment of this poet. Danae being by her mercilefs father inclofed in a cheft, and thrown into the fea with her child, when night comes on, and a ftorm arifes which threatens to overfet the cheft, fhe, weeping and embracing the young Perfeus, cries out:

Sweet child! what anguifh does thy mother know,
Ere cruel grief has taught thy tears to flow!
Amidft the roaring wind's tremendous found,
Which threats deftruction as it howls around;
In balmy fleep thou lieft, as at the breaft,
Without one bitter thought to break thy reft.——
The glimm'ring moon in pity hides her light,
And fhrinks with horror at the ghaftly fight.
Didft thou but know, fweet innocent! our woes,
Not opiate's pow'r thy eyelids now could clofe.

Sleep

Sleep on, ſweet babe! ye waves in ſilence roll;
And lull, O lull, to reſt my tortur'd ſoul!

There is a ſecond great poet of the name of Simonides recorded on the Marbles, ſuppoſed to have been his grandſon, and who gained, in 478 B. C. the prize in the games at Athens.

SIMONY, is the corrupt preſentation of any one to an eccleſiaſtical benefice for money, gift, or reward. It is ſo called from the reſemblance it is ſaid to bear o the ſin of Simon Magus, though the purchaſing of holy orders ſeems to approach nearer to his offence. It was by the canon law a very grievous crime: and is ſo much the more odious, becauſe, as Sir Edward Coke obſerves, it is ever accompanied with perjury; for the preſentee is ſworn to have committed no ſimony. However, it was not an offence puniſhable in a criminal way at the common law: it being thought ſufficient to leave the clerk to eccleſiaſtical cenſures. But as theſe did not affect the ſimoniacal patron, nor were efficacious enough to repel the notorious practice of the thing, divers acts of parliament have been made to reſtrain it by means of civil forfeitures; which the modern prevailing uſage, with regard to ſpiritual preferments, calls aloud to be put in execution. The ſtatute 31 Eliz. c. 6. enacts, that if any patron, for money or any other corrupt conſideration or promiſe, directly or indirectly given, ſhall preſent, admit, inſtitute, induct, inſtall, or collate any perſon to an eccleſiaſtical benefice or dignity, both the giver and taker ſhall forfeit two years value of the benefice or dignity; one moiety to the king, and the other to any one who will ſue for the ſame. If perſons alſo corruptly reſign or exchange their benefices, both the giver and taker ſhall in like manner forfeit double the value of the money or other corrupt conſideration. And perſons who ſhall corruptly ordain or licenſe any miniſter, or procure him to be ordained or licenſed (which is the true idea of ſimony), ſhall incur a like forfeiture of forty pounds; and the miniſter himſelf of ten pounds, beſides an incapacity to hold any eccleſiaſtical preferment for ſeven years afterwards. Corrupt elections and reſignations in colleges, hoſpitals, and other eleemoſynary corporations, are alſo puniſhed, by the ſame ſtatute, with forfeiture of the double value, vacating the place or office, and a devolution of the right of election, for that turn, to the crown.

SIMOOM, a hot wind which blows occaſionally in the deſerts of Africa, and probably in other widely extended countries parched in the ſame manner by a vertical ſun. Its effects on the human body are dreadful. If inhaled in any quantity, it produces inſtant ſuffocation, or at leaſt leaves the unhappy ſufferer oppreſſed with aſthma and lowneſs of ſpirits. The approach of this awful ſcourge of God is indicated by a redneſs in the air, well underſtood by thoſe who are accuſtomed to journey through the deſert; and the only refuge which they have from it, is to fall down with their faces cloſe to the ground, and to continue as long as poſſible without drawing in their breath.

Bruce's Travels, vol. iv. p. 559. Mr Bruce, who, in his journey through the deſert, ſuffered from the ſimoom, gives of it the following graphical deſcription: "At eleven o'clock, while we contemplated with great pleaſure the rugged top of Chiggre, to which we were faſt approaching, and where we were to ſolace ourſelves with plenty of good water, Idris our guide cried out, with a loud voice, Fall upon your faces, for here is the ſimoom. I ſaw from the ſouth-eaſt a haze come, in colour like the purple part of the rainbow, but not ſo compreſſed or thick. It did not occupy twenty yards in breadth, and was about twelve feet high from the ground. It was a kind of bluſh upon the air, and it moved very rapidly; for I ſcarce could turn to fall upon the ground with my head to the northward, when I felt the heat of its current plainly upon my face. We all lay flat on the ground as if dead, till Idris told us it was blown over. The meteor or purple haze which I ſaw was indeed paſſed, but the light air that ſtill blew was of heat to threaten ſuffocation. For my part, I found diſtinctly in my breaſt that I had imbibed a part of it, nor was I free of an aſthmatic ſenſation till I had been ſome months in Italy, at the baths of Poretta, near two years afterwards." Though the ſeverity of this blaſt ſeems to have paſſed over them almoſt inſtantaneouſly, it continued to blow ſo as to exhauſt them till twenty minutes before five in the afternoon, laſting through all its ſtages very near ſix hours, and leaving them in a ſtate of the utmoſt deſpondency.

SIMPLE, ſomething not mixed or compounded; in which ſenſe it ſtands oppoſed to *compound*.

SIMPLE, in the *Materia Medica*, a general name for all herbs or plants, as having each its particular virtue, whereby it becomes a ſimple remedy.

SIMPLICITY IN WRITING. If we examine the writers whoſe compoſitions have ſtood the teſt of ages, and obtained that higheſt honour, "the concurrent approbation of diſtant times and nations," we ſhall find that the character of ſimplicity is the unvarying circumſtance which alone hath been able to gain this univerſal homage from mankind. Among the Greeks, whoſe writers in general are of the ſimple kind, the divineſt poet, the moſt commanding orator, the fineſt hiſtorian, and deepeſt philoſopher, are, above the reſt, conſpicuouſly eminent in this great quality. The Roman writers riſe towards perfection according to that meaſure of ſimplicity which they mingle in their works; indeed they are all inferior to the Greek models. But who will deny that Lucretius, Horace, Virgil, Livy, Terence, Tully, are at once the ſimpleſt and beſt of Roman writers? unleſs we add the noble annaliſt who appeared in after-times; who, notwithſtanding the political turn of his genius, which ſometimes interferes, is admirable in this great quality, and by it far ſuperior to his contemporaries. It is this one circumſtance that hath raiſed the venerable Dante, the father of modern poetry, above the ſucceeding poets of his country, who could never long maintain the local and temporary honours beſtowed upon them; but have fallen under that juſt neglect which time will ever decree to thoſe who deſert a juſt ſimplicity for the florid colourings of ſtyle, contraſted phraſes, affected conceits, the mere trappings of compoſition and Gothic minutiæ. It is this which has given to Boileau the moſt laſting wreath in France, and to Shakeſpeare and Milton in England; eſpecially to the former, whoſe writings contain ſpecimens of perhaps the pureſt and ſimpleſt Engliſh that is anywhere to be found, except in the Bible or Book of Common Prayer. As it appears from theſe inſtances, that ſimplicity is the only univerſal characteriſtic of juſt writing, ſo the ſuperior eminence of the ſacred Scriptures in in this quality hath been generally acknowledged. One of the greateſt critics in antiquity, himſelf conſpicuous in the ſublime and ſimple manner, hath borne this teſtimony to the writings of Moſes and St Paul; and by parity of reaſon we muſt conclude, that had he been converſant with the other ſacred writers, his taſte and candour would have allowed them the ſame encomium.

It hath been often obſerved, even by writers of no mean rank, that the "Scriptures ſuffer in their credit by the diſadvantage of a literal verſion, while other ancient writings enjoy the advantage of a free and embelliſhed tranſlation." But in reality theſe gentlemen's concern is ill placed and groundleſs: for the truth is, "that moſt other writings are impaired by a literal tranſlation; whereas giving only a due regard to the idiom of different languages, the ſacred writings, when literally tranſlated, are then in their full perfection."

Now this is an internal proof, that in all other writings there is a mixture of local, relative, exterior ornament, which is often loſt in the transfuſion from one language to another. But the internal beauties, which depend not on the particular conſtruction of tongues, no change of tongue can deſtroy. Hence the Bible preſerves its native beauty and ſtrength alike in every language, by the ſole energy of unadorned phraſe, natural images, weight of ſentiment, and great ſimplicity.

It is in this reſpect like a rich vein of gold, which, under the ſevereſt trials of heat, cold, and moiſture, retains its original weight and ſplendour, without either loſs or alloy; while baſer metals are corrupted by earth, air, water, fire, and aſſimilated to the various elements through which they paſs.

This circumſtance, then, may be juſtly regarded as ſufficient to vindicate the compoſition of the ſacred Scriptures, as it is at once their chief excellence and greateſt ſecurity. It is their excellence, as it renders them intelligible and uſeful to all; it is their ſecurity, as it prevents their being diſguiſed by the falſe and capricious ornaments of vain or weak tranſlators. We may ſafely appeal to experience and fact for the confirmation of theſe remarks on the ſuperior ſimplicity, utility, and excellence, of the ſtyle of the Holy Scripture. Is there any book in the world ſo perfectly adapted to all capacities? that contains ſuch ſublime and exalted precepts, conveyed in ſuch an artleſs and intelligible ſtrain, that can be read with ſuch pleaſure and advantage by the lettered ſage and the unlettered peaſant?

SIMPLOCE. See Oratory, N° 72.

SIMPSON, Thomas, profeſſor of mathematics at the royal academy at Woolwich, fellow of the Royal Society, and member of the Royal Academy at Stockholm, was born at Market Boſworth in Leiceſterſhire in 1710. His father, a ſtuff-weaver, taught him only to read Engliſh, and brought him up to his own buſineſs; but meeting with a ſcientific pedlar, who likewiſe practiſed fortune-telling, young Simpſon by his aſſiſtance and advice left off weaving, and profeſſed aſtrology. As he improved in knowledge, however, he grew diſguſted with his pretended art; and renouncing it, was driven to ſuch difficulties for the ſubſiſtence of his family, that he came up to London, where he worked as a weaver, and taught mathematics at his ſpare hours. As his ſcholars increaſed, his abilities became better known, and he publiſhed his Treatiſe on Fluxions, by ſubſcription, in 1737: in 1740, he publiſhed his Treatiſe on the Nature and Laws of Chance; and Eſſays in Speculative and Mixed Mathematics. After theſe appeared his Doctrine of Annuities and Reverſions; Mathematical Diſſertations; Treatiſe on Algebra; Elements of Geometry; Trigonometry, Plane and Spherical; Select Exerciſes; and his Doctrine and Application of Fluxions, which he profeſſes to be rather a new work, than a ſecond edition of his former publication on fluxions. In 1743, he obtained the mathematical profeſſorſhip at Woolwich academy; and ſoon after was choſen a member of the Royal Society, when the preſident and council, in conſideration of his moderate circumſtances, were pleaſed to excuſe his admiſſion-fees, and his giving bonds for the ſettled future payments. At the academy he exerted all his abilities in inſtructing the pupils who were the immediate objects of his duty, as well as others whom the ſuperior officers of the ordnance permitted to be boarded and lodged in his houſe. In his manner of teaching he had a peculiar and happy addreſs, a certain dignity and perſpicuity, tempered with ſuch a degree of mildneſs, as engaged the attention, eſteem, and friendſhip, of his ſcholars. He therefore acquired great applauſe from his ſuperiors in the diſcharge of his duty. His application and cloſe confinement, however, injured his health. Exerciſe and a proper regimen were preſcribed to him, but to little purpoſe: for his ſpirits ſunk gradually, till he became incapable of performing his duty, or even of reading the letters of his friends. The effects of this decay of nature were greatly increaſed by vexation of mind, owing to the haughty and inſulting behaviour of his ſuperior the firſt profeſſor of mathematics. This perſon, greatly his inferior in mathematical accompliſhments, did what he could to make his ſituation uneaſy, and even to depreciate him in the public opinion: but it was a vain endeavour, and only ſerved to depreſs himſelf. At length his phyſicians adviſed his native air for his recovery, and he ſet out in February 1761; but was ſo fatigued by his journey, that upon his arrival at Boſworth, he betook himſelf to his chamber, and grew continually worſe till the day of his death, which happened on the 14th of May, in the 51ſt year of his age.

SIMSON, Dr Robert, profeſſor of mathematics in the univerſity of Glaſgow, was born in the year 1687 of a reſpectable family, which had held a ſmall eſtate in the county of Lanark for ſome generations. He was, we think, the ſecond ſon of the family. A younger brother was profeſſor of medicine in the univerſity of St Andrew's, and is known by ſome works of reputation, particularly a Diſſertation on the Nervous Syſtem, occaſioned by the Diſſection of a Brain completely Oſſified.

Dr Simſon was educated in the univerſity of Glaſgow under the eye of ſome of his relations who were profeſſors. Eager after knowledge, he made great progreſs in all his ſtudies; and, as his mind did not, at the very firſt openings of ſcience, ſtrike into that path which afterwards ſo ſtrongly attracted him, and in which he proceeded ſo far almoſt without a companion, he acquired in every walk of ſcience a ſtock of information, which, though it had never been much augmented afterwards, would have done credit to a profeſſional man in in any of his ftudies. He became, at a very early period, an adept in the philofophy and theology of the fchools, was able to fupply the place of a fick relation in the clafs of oriental languages, was noted for hiftorical knowledge, and one of the moft knowing botanifts of his time.

It was during his theological ftudies, as preparatory for his entering into orders, that mathematics took hold of his fancy. He ufed to tell in his convivial moments how he amufed himfelf when preparing his exercifes for the divinity hall. When tired with vague fpeculation, in which he did not meet with certainty to reward his labours, he turned up a book of oriental philology, in which he found fomething which he could difcover to be true or to be falfe, without going out of the line of ftudy which was to be of ultimate ufe to him. Sometimes even this could not relieve his fatigue. He then had recourfe to mathematics, which never failed to fatisfy and refrefh him. For a long while he reftricted himfelf to a very moderate ufe of the cordial, fearing that he would foon exhauft the fmall ftock which fo limited and abftract a fcience could yield; till at laft he found, that the more he learned, a wider field opened to his view, and fcenes that were inexhauftible. Becoming acquainted with fubjects far beyond the elements of the fcience, and with numbers of names celebrated during that period of ardent refearch all over Europe, he found it to be a manly and important ftudy, by which he was as likely to acquire reputation as by any other. About this time, too, a profpect began to open of making mathematics his profeffion for life. He then gave himfelf up to it without referve.

His original incitement to this ftudy as a treat, as fomething to pleafe and refrefh his mind in the midft of feverer tafks, gave a particular turn to his mathematical ftudies, from which he never could afterwards deviate. Perfpicuity and elegance are more attainable, and more difcernible, in pure geometry, than in any other parts of the fcience of meafure. To this therefore he chiefly devoted himfelf. For the fame reafon he preferred the ancient method of ftudying pure geometry, and even felt a diflike to the Cartefian method of fubftituting fymbols for operations of the mind, and ftill more was he difgufted with the fubftitution of fymbols for the very objects of difcuffion, for lines, furfaces, folids, and their affections. He was rather difpofed in the folution of an algebraical problem, where quantity alone was confidered, to fubftitute figure and its affections for the algebraical fymbols, and to convert the algebraic formula into an analogous geometrical theorem. And he came at laft to confider algebraic analyfis as little better than a kind of mechanical knack, in which we proceed without ideas of any kind, and obtain a refult without meaning, and without being confcious of any procefs of reafoning, and therefore without any conviction of its truth. And there is no denying, that if genuine unfophifticated tafte alone is to be confulted, Dr Simfon was in the right: for though it muft alfo be acknowledged, that the reafoning in algebra is as ftrict as in the pureft geometry of Euclid or Apollonius, the *expert* analyft has little perception of it as he goes on, and his final equation is not felt by himfelf as the refult of ratiocination, any more than if he had obtained it by Pafcal's arithmetical mill. This does not in the leaft diminifh our admiration of the algebraic analyfis; for its almoft boundlefs grafp, its rapid and certain procedure, and the delicate metaphyfics and great addrefs which may be difplayed in conducting it. Such, however, was the ground of the ftrong bias of Dr Simfon's mind to the analyfis of the ancient geometers. It increafed as he went forwards; and his veneration (we may call it his *love* or *affection*) for the ancient geometry was carried to a degree of idolatry. His chief labours were exerted in efforts to reftore the works of the ancient geometers; and he has nowhere beftowed much pains in advancing the modern difcoveries in mathematics. The noble inventions, for example, of fluxions and of logarithms, by which our progrefs in mathematical knowledge, and in the ufeful application of this knowledge, is fo much promoted, attracted the notice of Dr Simfon; but he has contented himfelf with demonftrating their truth on the genuine principles of the ancient geometry. Yet was he very thoroughly acquainted with all the modern difcoveries; and there are to be feen among his papers difcuffions and inveftigations in the Cartefian method, which fhow him thoroughly acquainted with all the principles, and even expert in the *tours de main*, of the moft refined fymbolical analyfis (A).

About the age of 25 Dr Simfon was chofen profeffor of mathematics in the univerfity of Glafgow. He went to London immediately after his appointment, and there formed an acquaintance with the moft eminent men of that bright era of Britifh fcience. Among thefe he always mentioned Captain Halley (the celebrated Dr Edmund Halley) with particular refpect; faying, that he had the moft acute penetration, and the moft juft tafte in that fcience, of any man he had ever known. And, indeed, Dr Halley has ftrongly exemplified both of thefe in his divination of the work of *Apollonius de Sectione Spatii*, and the 8th book of his *Conics*, and in fome of the moft beautiful theorems in Sir Ifaac Newton's *Principia*. Dr Simfon alfo admired the wide and mafterly fteps which Newton was accuftomed to take in his inveftigations, and his manner of fubftituting geometrical figures for the quantities which are obferved in the phenomena of nature. It was from Dr Simfon that the writer of this article had the remark which has been oftener than once repeated in the courfe of this Work, "That the 39th propofition of the firft book of the *Principia* was the moft important propofition

(A) In 1752 the writer of this article being then his fcholar, requefted him to examine an account which he gave him of what he thought a new curve (a conchoid having a circle for its bafe). Dr Simfon returned it next day with a regular lift of its leading properties, and the inveftigation of fuch as he thought his fcholar would not fo eafily trace. In this hafty fcrawl the lines related to the circle were familiarly confidered as arithmetical fractions of the radius confidered as unity. This was before Euler publifhed his Arithmetic of the Sines and Tangents, now in univerfal ufe.

poſition that had ever been exhibited to the phyſico-mathematical philoſopher;" and he uſed always to illuſtrate to his more advanced ſcholars the ſuperiority of the geometrical over the algebraic analyſis, by comparing the ſolution given by Newton of the inverſe problem of centripetal forces, in the 42d propoſition of that book, with the one given by John Bernoulli in the Memoirs of the Academy of Sciences at Paris for 1713. We have heard him ſay, that to his own knowledge Newton frequently inveſtigated his propoſitions in the ſymbolical way, and that it was owing chiefly to Dr Halley that they did not finally appear in that dreſs. But if Dr Simſon was well informed, we think it a great argument in favour of the ſymbolic analyſis, when this moſt ſucceſsful *practical artiſt* (for ſo we muſt call Newton when engaged in a taſk of diſcovery) found it conducive either to diſpatch or perhaps to his very progreſs.

Returning to his academical chair, Dr Simſon diſcharged the duties of a profeſſor for more than 50 years with great honour to the univerſity and to himſelf.

It is almoſt needleſs to ſay, that in his prelections he followed ſtrictly the Euclidian method in elementary geometry. He made uſe of Theodoſius as an introduction to ſpherical trigonometry. In the higher geometry he prelected from his own Conics; and he gave a ſmall ſpecimen of the *linear problems* of the ancients, by explaining the properties, ſometimes of the conchoid, ſometimes of the ciſſoid, with their application to the ſolution of ſuch problems. In the more advanced claſs he was accuſtomed to give Napier's mode of conceiving logarithms, i. e. quantities as generated by motion; and Mr Cotes's view of them, as the ſums of ratiunculæ; and to demonſtrate Newton's lemmas concerning the limits of ratios; and then to give the elements of the fluxionary calculus; and to finiſh his courſe with a ſelect ſet of propoſitions in optics, gnomonics, and central forces. His method of teaching was ſimple and perſpicuous, his elocution clear, and his manner eaſy and impreſſive. He had the reſpect, and ſtill more the affection, of his ſcholars.

With reſpect to his ſtudies, we have already informed the reader that they got an early bias to pure geometry, and to the elegant but ſcrupulous methods of the ancients.

We have heard Dr Simſon ſay, that it was in a great meaſure owing to Dr Halley that he ſo early directed his efforts to the reſtoration of the ancient geometers. He had recommended this to him, as the moſt certain way for him, then a very young man, both to acquire reputation, and to improve his own knowledge and taſte, and he preſented him with a copy of Pappus's Mathematical Collections, enriched with ſome of his own notes. The perſpicuity of the ancient geometrical analyſis, and a certain elegance in the nature of the ſolutions which it affords, eſpecially by means of the local theorems, ſoon took firm hold of his fancy, and made him, with the ſanguine expectation of a young man, direct his very firſt efforts to the recovery of this *in toto*; and the reſtoration of Euclid's Poriſms was the firſt taſk which he ſet himſelf. The accompliſhed geometer knows what a deſperate taſk this was, from the ſcanty and mutilated account which we have of this work in a ſingle paſſage of Pappus. It was an ambition which nothing but ſucceſs could juſtify in ſo young an adventurer. He ſucceeded; and ſo early as 1718 ſeemed to have been in complete poſſeſſion of this method of inveſtigation, which was conſidered by the eminent geometers of antiquity as their ſureſt guide through the labyrinths of the higher geometry. Dr Simſon gave a ſpecimen of his diſcovery in 1723 in the Philoſophical Tranſactions. And after this time he ceaſed not from his endeavours to recover that choice collection of Poriſms which Euclid had collected, as of the moſt general uſe in the ſolution of difficult queſtions. What ſome of theſe muſt have been was pointed out to Dr Simſon by the very nature of the general propoſition of Pappus, which he has reſtored. Others were pointed out by the lemmas which Pappus has given as helps to the young mathematician towards their demonſtration. And, being thus in poſſeſſion of a conſiderable number, their mutual relations pointed out a ſort of ſyſtem, of which theſe made a part, and of which the blanks now remained to be filled up.

Dr Simſon, having thus gained his favourite point, had leiſure to turn his attention to the other works of the ancient geometers; and the poriſms of Euclid now had only an occaſional ſhare. The *loci plani* of Apollonius was another taſk which he very early engaged in, and completed about the year 1738. But, after it was printed, he imagined that he had not given the *ipſiſſimæ propoſitiones* of Apollonius, and in the preciſe ſpirit and order of that author. The impreſſion lay by him for ſome years; and it was with great reluctance that he yielded to the intreaties of his mathematical friends, and publiſhed the work, in 1746, with ſome emendations, where he thought he had deviated fartheſt from his author. He quickly repented of this ſcanty conceſſion, and recalled what he could of the ſmall number of copies which he had given to the bookſellers, and the impreſſion again lay by him for years. He afterwards recorrected the work, and ſtill with ſome reluctance allowed it to come abroad as the Reſtitution of Apollonius. The public, however, had not been ſo faſtidious as Dr Simſon, and the work had acquired great celebrity, and he was now conſidered as one of the firſt and the moſt elegant geometers of the age: for, in the mean time, he had publiſhed his Conic Sections, a work of uncommon merit, whether we conſider it as equivalent to a complete reſtitution of the celebrated work of Apollonius Pergæus, or as an excellent ſyſtem of this important part of mathematics. It is marked with the ſame features as the *loci plani*, the moſt anxious ſolicitude to exhibit the very text of Apollonius, even in the propoſitions belonging to the books which had been completely loſt. Theſe could be recovered in no other way but by a thorough knowledge of the preciſe plan propoſed by the author, and by taking it for granted that the author had accurately accompliſhed this plan. In this manner did Viviani proceed in the firſt attempt which was made to reſtore the conics of Apollonius; and he has given us a detail of the proceſs of his conjectures, by which we may form an opinion of its juſtneſs, and of the probability how far he has attained the deſired object. Dr Simſon's view in his performance was ſomething different, deviating a little in this one caſe from his general track. He was not altogether pleaſed with the work of Viviani, even as augmented by the eighth book added by Halley, and his wiſh was to reſtore the ancient original. But, in the mean time, an

Simson. academical text book for conic sections was much wanted. He was much dissatisfied with those in common use; and he was not insensible of the advantage resulting from the consideration of these sections, independent of the cone first introduced by Dr Wallis. He therefore composed this excellent treatise as an elementary book, not to supersede, but to prepare for the study of Apollonius; and accordingly accommodates it to this purpose, and gives several important propositions in their proper places, *expressly as restitutions of Apollonius*, whom he keeps constantly in view through the whole work.

Much about this time Dr Simson seriously began to prepare a perfect edition of Euclid's Elements. The intimate acquaintance which he had by this time acquired with all the original works of the ancient geometers, and their ancient commentators and critics, encouraged him to hope that he could restore to his original lustre this leader in mathematical science; and the errors which had crept into this celebrated work, and which still remained in it, appeared of magnitude sufficient to merit the most careful efforts for their removal. The DATA also, which were in like manner the introduction to the whole art of geometrical investigation, seemed to call more loudly for his amending hand. For it appears that the Saracens, who have preserved to us the writings of the ancients, have contented themselves with admiring these celebrated works, and have availed themselves of the knowledge which they contain; but they have shown no inclination to add to the stock, or to promote the sciences which they had received. They could not do any thing without the synthetical books of the geometers; but, not meaning to go beyond the discoveries which they had made, they neglected all the books which related to the analytic art alone, and the greatest part of them (about 25 out of 30) have irrecoverably perished. The data of Euclid have fortunately been preserved, but the book was neglected, and the only ancient copies, which are but three or four, are miserably erroneous and mutilated. Fortunately, it is no very arduous matter to reinstate this work in its original perfection. The plan is precise, both in its extent and its method. It had been restored, therefore, with success by more than one author. But Dr Simson's comprehensive view of the whole analytical system pointed out to him many occasions for amendment. He therefore made its institution a joint task with that of the elements. All the lovers of true geometry will acknowledge their obligations to him for the edition of the Elements and data which he published about 1758. The text is corrected with the most judicious and scrupulous care, and the notes are inestimable, both for their information, and for the tendency which they must have to form the mind of the student to a true judgement and taste in mathematical subjects. The more accomplished reader will perhaps be sometimes disposed to smile at the axiom which seems to pervade the notes, "that a work of Euclid must be supposed without error or defect." If this was not the case, Euclid has been obliged to his editor in more instances than one. Nor should his greatest admirers think it impossible that in the progress of human improvement, a geometrical truth should occur to one of these latter days, which escaped the notice of even the Lincean Euclid. Such merit, however, Dr Simson nowhere claims, but lays every blame of error, omission, or obscurity, to the charge of Proclus, Theon, and other editors and commentators of the renowned Grecian. Simson.

There is another work of Apollonius on which Dr Simson has bestowed great pains, and has restored, as we imagine, *omnibus numeris perfectum*, viz. the SECTIO DETERMINATA; one of those performances which are of indispensable use in the application of the ancient analysis. This also seems to have been an early task, though we do not know the date of his labours on it. It did not appear till after his death, being then published along with the great work, the Porisms of Euclid, at the expence of the late Earl Stanhope, a nobleman intimately conversant with the ancient geometry, and zealous for its reception among the mathematicians of the present age. He had kept up a constant correspondence with Dr Simson on mathematical subjects; and at his death in 1768, engaged Mr Clow professor of logic in the university of Glasgow, to whose care the Doctor had left all his valuable papers, to make a selection of such as would serve to support and increase his well-earned reputation as THE RESTORER of ANCIENT GEOMETRY.

We have been thus particular in our account of Dr Simson's labours in these works, because his manner of execution, while it does honour to his inventive powers, and shows his just taste in mathematical composition, also confirms our former assertion, that he carried his respect for the ancient geometers to a degree of superstitious idolatry, and that his fancy, unchecked, viewed them as incapable of error or imperfection. This is distinctly to be seen in the emendations which he has given of the texts, particularly in his editions of Euclid. Not only every imperfection of the reading is ascribed to the ignorance of copyists, and every indistinctness in the conception, inconclusiveness in the reasoning, and defect in the method, is ascribed to the ignorance or mistake of the commentators; but it is all along assumed that the work was perfect in its kind; and that by exhibiting a perfect work, we restore the genuine original. This is surely gratuitous; and it is very possible that it has, in some instances, made Dr Simson fail of his anxious purpose, and give us even a better than the original. It has undoubtedly made him fail in what *should have been* his great purpose, viz. to give the world a connected system of the ancient geometrical analysis; such as would, in the first place, exhibit it in its most engaging form, elegant, perspicuous, and comprehensive; and, in the next place, such as should engage the mathematicians of the present age to adopt it as the most certain and successful conductor in those laborious and difficult researches in which the demands of modern science continually engage them. And this might have been expected, in the province of speculative geometry at least, from a person of such extensive knowledge of the properties of figure, and who had so eminently succeeded in the many trials which he had made of its powers. We might have expected that he would at least have exhibited in one systematic point of view, what the ancients had done in several detached branches of the science, and how far they had proceeded in the solution of the several successive classes of problems; and we might have hoped, that he would have instructed us in what manner we should apply that method to the solution of problems of a more elevated kind, daily presented

Simfon.

fented to us in the queftions of phyfico-mathematical fcience. By this he would have acquired diftinguifhed honour, and fcience would have received the moft valuable improvement. But Dr Simfon has done little of all this; and we cannot fay that great helps have been derived from his labours by the eminent mathematicians of this age, who are fuccefsfully occupied in advancing our knowledge of nature, or in improving the arts of life. He has indeed contributed greatly to the entertainment of the fpeculative mathematician, who is more delighted with the confcious exercife of his own reafoning powers, than with the final refult of his refearches. Yet we are not even certain that Dr Simfon has done this to the extent he wifhed and hoped. He has not engaged the liking of mathematicians to this analyfis, by prefenting it in the moft agreeable form. His own extreme anxiety to tread in the very footfteps of the original authors, has, in a thoufand inftances, precluded him from ufing his own extenfive knowledge, that he might not employ principles which were not of a clafs inferior to that of the queftion in hand. Thus, of neceffity, did the method appear trammelled. We are deterred from employing a procefs which appears to reftrain us in the application of the knowledge which we have already acquired; and, difgufted with the tedious, and perhaps indirect path, by which we muft arrive at an object which we fee clearly over the hedge, and which we could reach by a few fteps, of the fecurity of which we are otherwife perfectly affured. Thefe prepoffeffions are indeed founded on miftake; but the miftake is fuch, that all fall into it, till experience has enlarged their views. This circumftance alone has hitherto prevented mathematicians from acquiring that knowledge of the ancient analyfis which would enable them to proceed in their refearches with certainty, difpatch, and delight. It is therefore deeply to be regretted, that this eminent genius has occupied, in this fuperftitious palæology, a long and bufy life, which might have been employed in original works of infinite advantage to the world, and honour to himfelf.

Our readers will, it is hoped, confider thefe obfervations as of general fcientific importance, and as intimately connected with the hiftory of mathematics; and therefore as not improperly introduced in the biographical account of one of the moft eminent writers on this fcience. Dr Simfon claimed our notice as a mathematician; and his affectionate admiration of the ancient analyfis is the prominent feature of his literary character. By this he is known all over Europe; and his name is never mentioned by any foreign author without fome very honourable allufion to his diftinguifhed geometrical elegance and fkill. Dr James Moor, profeffor of Greek in the univerfity of Glafgow, no lefs eminent for his knowledge in ancient geometry than for his profeffional talents, put the following appofite infcription below a portrait of Dr Simfon:

GEOMETRIAM, SUB TYRANNO BARBARO SÆVA
SERVITUTE DIU SQUALENTEM, IN LIBERTATEM
ET DECUS ANTIQUUM VINDICAVIT
UNUS.

Yet it muft not be underftood that Dr Simfon's predilection for the geometrical analyfis of the ancients did fo far miflead him as to make him neglect the fymbolical analyfis of the prefent times; on the contrary, he was completely mafter of it, as has been already obferved, and frequently employed it. In his academical lectures to the ftudents of his upper claffes, he ufed to point out its proper province (which he by no means limited by a fcanty boundary), and in what cafes it might be applied with fafety and advantage even to queftions of pure geometry. He once honoured the writer of this article with the fight of a very fhort differtation on this fubject (perhaps the one referred to in the preface to his Conic Sections). In this piece he was perhaps more liberal than the moft zealous partifans of the fymbolical analyfis could defire, admitting as a fufficient equation of the Conic Sections $L = \frac{p^2 c}{x^2}$, where L is the *latus rectum*, x is the diftance of any point of the curve from the focus, p is the perpendicular drawn from the focus to the tangent in the given point, and c is the chord of the equicurve circle drawn through the focus. Unfortunately this differtation was not found among his papers. He fpoke in high terms of the Analytical Works of Mr Cotes, and of the two Bernoullis. He was confulted by Mr M'Laurin during the progrefs of his ineftimable Treatife of Fluxions, and contributed not a little to the reputation of that work. The fpirit of that moft ingenious algebraic demonftration of the fluxions of a rectangle, and the very procefs of the argument, is the fame with Dr Simfon's in his differtation on the limits of quantities. It was therefore from a thorough acquaintance with the fubject, and by a juft tafte, that he was induced to prefer his favourite analyfis, or, to fpeak more properly, to exhort mathematicians to employ it in its own fphere, and not to become ignorant of geometry, while he fuccefsfully employed the fymbolical analyfis in cafes which did not require it, and which fuffered by its admiffion. It muft be acknowledged, however, that in his later years, the difguft which he felt at the artificial and flovenly employment on fubjects of pure geometry, fometimes hindered him from even looking at the moft refined and ingenious improvements of the algebraic analyfis which occur in the writings of Euler, D'Alembert, and other eminent mafters. But, when properly informed of them, he never failed to give them their due praife; and we remember him fpeaking, in terms of great fatisfaction, of an improvement of the infinitefimal calculus, by D'Alembert and De la Grange, in their refearches concerning the propagation of found, and the vibrations of mufical cords.

And that Dr Simfon not only was mafter of this calculus and the fymbolical calculus in general, but held them in proper efteem, appears from two valuable differtations to be found in his pofthumous works; the one on logarithms, and the other on the limits of ratios. The laft, in particular, fhows how completely he was fatisfied with refpect to the folid foundation of the method of fluxions; and it contains an elegant and ftrict demonftration of all the applications which have been made of the method by its illuftrious author to the objects of pure geometry.

We hoped to have given a much more complete and inftructive account of this eminent geometer and his works, by the aid of a perfon fully acquainted with both, and able to appreciate their value; but an accident has deprived us of this affiftance, when it was too late to procure an equivalent: and we muft requeft our readers to accept of this very imperfect account, fince we cannot do juftice to Dr Simfon's merit, unlefs almoft

equally

equally converfant in all the geometry of the ancient Greeks.

The life of a literary man rarely teems with anecdote; and a mathematician, devoted to his ftudies, is perhaps more abftracted than any other perfon from the ordinary occurrences of life, and even the ordinary topics of converfation. Dr Simfon was of this clafs; and, having never married, lived entirely a college life. Having no occafion for the commodious houfe to which his place in the univerfity entitled him, he contented himfelf with chambers, good indeed, and fpacious enough for his fober accommodation, and for receiving his choice collection of mathematical writers, but without any decoration or commodious furniture. His official fervant fufficed for valet, footman, and chambermaid. As this retirement was entirely devoted to ftudy, he entertained no company in his chambers, but in a neighbouring houfe, where his apartment was facred to him and his guefts.

Having in early life devoted himfelf to the reftoration of the works of the ancient geometers, he ftudied them with unremitting attention; and, retiring from the promifcuous intercourfe of the world, he contented himfelf with a fmall fociety of intimate friends, with whom he could lay afide every reftraint of ceremony or referve, and indulge in all the innocent frivolities of life. Every Friday evening was fpent in a party at whift, in which he excelled, and took delight in inftructing others, till increafing years made him lefs patient with the dulnefs of a fcholar. The card-party was followed by an hour or two dedicated folely to playful converfation. In like manner, every Saturday he had a lefs felect party to dinner at a houfe about a mile from town. The Doctor's long life gave him occafion to fee the *dramatis perfonæ* of this little theatre feveral times completely changed, while he continued to give it a perfonal identity: fo that, without any defign or wifh of his own, it became, as it were, his own houfe and his own family, and went by his name. In this ftate did the prefent writer firft fee it, with Dr Simfon as its father and head, refpected and beloved by every branch; for, as it was for relaxation, and not for the enjoyment of his acknowledged fuperiority, that he continued this habit of his early youth; and as his notions "of a fine talk" did not confift in the pleafure of having "toffed and gored a good many to-day," his companions were as much at their eafe as he wifhed to be himfelf; and it was no fmall part of their entertainment (and of his too), to fmile at thofe innocent deviations from common forms, and thofe miftakes with refpect to life and manners, which an almoft total retirement from the world, and inceffant occupation in an abftract fcience, caufed this venerable prefident frequently to exhibit. Thefe are remembered with a more affecting regret, that they are now "with the days that are paft," than the moft pithy apophthegms, ufhered in with an emphatical, "Why, Sir!" or "No, Sir!" which precludes all reply. Dr Simfon never exerted his prefidial authority, unlefs it were to check fome infringement of good breeding, or any thing that appeared unfriendly to religion or purity of manners; for thefe he had the higheft reverence. We have twice heard him fing (he had a fine voice and moft accurate ear) fome lines of a Latin hymn to the Divine Geometer, and each time the rapturous tear ftood in his eye.

But we afk the reader's pardon for this digreffion; it is not however ufelefs, fince it paints the man as much as any recital of his ftudies; and to his acquaintances we are certain that it will be an acceptable memorandum. To them it was often matter of regret, that a perfon of fuch eminent talents, which would have made him fhine equally in any line of life, fhould have allowed himfelf to be fo completely devoted to a ftudy which abftracted him from the ordinary purfuits of men, unfitted him for the active enjoyment of life, and kept him out of thofe walks which they frequented, and where they would have rejoiced to meet him.

Dr Simfon was of an advantageous ftature, with a fine countenance; and even in his old age had a graceful carriage and manner, and always, except when in mourning, dreffed in white cloth. He was of a cheerful difpofition; and though he did not make the firft advances to acquaintance, had the moft affable manner, and ftrangers were at perfect eafe in his company. He enjoyed a long courfe of uninterrupted health; but towards the clofe of life fuffered from an acute difeafe, and was obliged to employ an affiftant in his profeffional labours for a few years preceding his death, which happened in 1768, at the age of 81. He left to the univerfity his valuable library, which is now arranged apart from the reft of the books, and the public ufe of it is limited by particular rules. It is confidered as the moft choice collection of mathematical books and manufcripts in the kingdom, and many of them are rendered doubly valuable by Dr Simfon's notes.

SIN, a breach or tranfgreffion of fome divine law or command.

SINAI, or SINA, a famous mountain of Arabia Petræa, upon which God gave the law to Mofes. It ftands in a kind of peninfula, formed by the two arms of the Red fea, one of which ftretches out towards the north, and is called the *gulf of Kolfum;* the other extends towards the eaft, and is called the *gulf of Elan*, or the *Elanitifh fea*. At this day the Arabians call Mount Sinai by the name of *Tor*, that is, the "mountain," by way of excellence; or *Gibel* or *Jibel Moufa*, "the mountain of Mofes." It is 260 miles from Cairo, and generally it requires a journey of ten days to travel thither. The wildernefs of Sinai, where the Ifraelites continued encamped for almoft a year, and where Mofes erected the tabernacle of the covenant, is confiderably elevated above the reft of the country; and the afcent to it is by a very craggy way, the greateft part of which is cut out of the rock; then one comes to a large fpace of ground, which is a plain furrounded on all fides by rocks and eminences, whofe length is nearly 12 miles. Towards the extremity of this plain, on the north fide, two high mountains fhow themfelves, the higheft of which is called *Sinai* and the other *Horeb*. The tops of Horeb and Sinai have a very fteep afcent, and do not ftand upon much ground, in comparifon to their extraordinary height: that of Sinai is at leaft one-third part higher than the other, and its afcent is more upright and difficult.

Two German miles and a half up the mountain ftands the convent of St Catharine. The body of this monaftery is a building 120 feet in length and almoft as many in breadth. Before it ftands another fmall building, in which is the only gate of the convent, which remains always fhut, except when the bifhop is here.

Niebuhr's Travels, vol i. p. 192.

here. At other times, whatever is introduced within the convent, whether men or provisions, is drawn up by the roof in a basket, and with a cord and a pulley. The whole building is of hewn stone; which, in such a desert, must have cost prodigious expence and pains. Near this chapel issues a fountain of very good fresh water; it is looked upon as miraculous by some who cannot conceive how water can flow from the brow of so fresh and barren a mountain. Five or six paces from it they show a stone, the height of which is four or five feet, and breadth about three, which, they say, is the very stone whence Moses caused the water to gush out. Its colour is of a spotted gray, and it is as it were set in a kind of earth, where no other rock appears. The stone has 12 holes or channels, which are about a foot wide, whence it is thought the water came forth for the Israelites to drink.

Much has been said of the writings to be seen at Sinai and in the plain about it; and such were the hopes of discoveries respecting the wanderings of the Israelites from these writings, that Dr Clayton bishop of Clogher offered 500l. sterling to defray the expences of journey to any man of letters who would undertake to copy them. No man, we believe, undertook this task: and the accurate Danish traveller Niebuhr found no writings there, but the names of persons who had visited the place from curiosity, and of Egyptians who had chosen to be buried in that region.

SINAPIS, MUSTARD, a genus of plants belonging to the class *tetradynamia*, and to the order *siliquosa*; and in the natural system ranged under the 39th order, *Siliquosæ*. See BOTANY *Index*.

SINAPISM, in *Pharmacy*, an external medicine, in form of a cataplasm, composed chiefly of mustard-seed pulverized, and other ingredients mentioned in the preceding article.

SINCERITY, honesty of intention, freedom from hypocrisy. See MORAL PHILOSOPHY, N° 157.

SINCIPUT, in *Anatomy*, the forepart of the head, reaching from the forehead to the coronal suture.

SINDY, a province of Hindostan Proper, bounded on the west by Makran, a province of Persia; on the north by the territories of the king of Candahar; on the north-east by those of the Seiks; on the east by a sandy desert; and on the south-east by Cutch. It extends along the course of the river Sinde or Indus from its mouth to Behker or Bhakor, on the frontiers of Moultan. Reckoned that way, it is 300 miles long; and its breadth, in its widest part, is about 160. In many particulars of soil and climate, and in the general appearance of the surface, Sindy resembles Egypt; the lower part of it being composed of rich vegetable mould, and extended into a wide dell; while the upper part of it is a narrow slip of country, confined on one side by a ridge of mountains, and on the other by a sandy desert, the river Indus, equal at least to the Nile, winding through the midst of this level valley, and annually overflowing it. During great part of the south-west monsoon, or at least in the months of July, August, and part of September, which is the rainy season in most other parts of India, the atmosphere is here generally clouded; but no rain falls except very near the sea. Indeed, very few showers fall during the whole year; owing to which, and the neighbourhood of the sandy deserts, which bound it on the east and on the north-west, the heats are so violent, and the winds from those quarters so pernicious, that the houses are contrived so as to be occasionally ventilated by means of apertures on the tops of them, resembling the funnels of small chimneys. When the hot winds prevail, the windows are closely shut; and the lowest part of the current of air, which is always the hottest, being thus excluded, a cooler, because more elevated, part descends into the house through the funnels. By this contrivance also vast clouds of dust are excluded; the entrance of which would alone be sufficient to render the house uninhabitable. The roofs are composed of thick layers of earth instead of terraces. Few countries are more unwholesome to European constitutions, particularly the lower part of the Delta. The prince of this province is a Mahometan, tributary to the king of Candahar. He resides at Hydrabad, although Tatta is the capital. The Hindoos, who were the original inhabitants of Sindy, are by their Mahometan governors treated with great rigour, and denied the public exercise of their religion; and this severity drives vast numbers of them into other countries. The inland parts of Sindy produce saltpetre, sal-ammoniac, borax, bezoar, lapis lazuli, and raw silk. They have also manufactories of cotton and silk of various kinds; and they make fine cabinets, inlaid with ivory, and finely lackered. They also export great quantities of butter, clarified and wrapt up in duppas, made of the hides of cattle. The ladies wear hoops of ivory on both their arms and legs, which when they die are burnt with them. They have large black cattle, excellent mutton, and small hardy horses. Their wild game are deer, hares, antelopes, and foxes, which they hunt with dogs, leopards, and a small fierce creature called a shiahgush.

SINE, or *Right SINE of an Arch*, in *Trigonometry*, is a right line drawn from one end of that arch, perpendicular to the radius drawn to the other end of the arch; being always equal to half the cord of twice the arch. See TRIGONOMETRY and GEOMETRY.

SINECURE, a nominal office, which has a revenue without any employment.

SINEW, a tendon, that which unites the muscles to the bones.

SINGING, the action of making divers inflections of the voice, agreeable to the ear, and correspondent to the notes of a song or piece of melody. See MELODY.

The first thing to be done in learning to sing, is to raise a scale of notes by tones and semitones to an octave, and descend by the same notes; and then to rise and fall by greater intervals, as a third, fourth, fifth, &c. and to do all this by notes of different pitch. Then these notes are represented by lines and spaces, to which the syllables *fa*, *sol*, *la*, *mi*, are applied, and the pupil taught to name each line and space thereby; whence this practice is called *sol-faing*, the nature, reason, effects, &c. whereof, see under the article SOLFAING.

SINGING of Birds. It is worthy of observation, that the female of no species of birds ever sings: with birds it is the reverse of what occurs in human kind. Among the feathered tribe, all the cares of life fall to the lot of the tender sex; theirs is the fatigue of incubation; and the principal share in nursing the helpless brood: to alleviate these fatigues, and to support her under them, nature hath given to the male the song, with all the little

little blandiſhments and ſoothing arts; theſe he fondly exerts (even after courtſhip) on ſome ſpray contiguous to the neſt, during the time his mate is performing her parental duties. But that ſhe ſhould be ſilent is alſo another wiſe proviſion of nature, for her ſong would diſcover her neſt; as would a gaudineſs of plumage, which, for the ſame reaſon, ſeems to have been denied her.

On the ſong of birds ſeveral curious experiments and obſervations have been made by the Hon. Daines Barrington. See *Phil. Tranſ.* vol. lxiii.

SINGULAR NUMBER, in *Grammar*, that number of nouns and verbs which ſtands oppoſed to plural. See GRAMMAR, N° 14.

SINISTER, ſomething on or towards the left hand. Hence ſome derive the word *ſiniſter à ſinendo;* becauſe the gods, by ſuch auguries, permit us to proceed in our deſigns.

SINISTER, is ordinarily uſed among us for unlucky; though, in the ſacred rites of divination, the Romans uſed it in an oppoſite ſenſe. Thus *avis ſiniſtra*, or a bird on the left hand, was eſteemed a happy omen: whence, in the law of the 12 tables, *Ave ſiniſtra populi magiſter eſto*.

SINISTER, in *Heraldry*. The ſiniſter ſide of an eſcutcheon is the left-hand ſide; the ſiniſter chief, the left angle of the chief; the ſiniſter baſe, the left-hand part of the baſe.

SINISTER Aſpect, among aſtrologers, is an appearance of two planets happening according to the ſucceſſion of the ſigns; as Saturn in Aries, and Mars in the ſame degree of Gemini.

SINISTRI, a ſet of ancient heretics, thus called becauſe they held the left hand in abhorrence, and made it a point of religion not to receive any thing therewith.

SINKING FUND, a proviſion made by parliament, conſiſting of the ſurpluſage of other funds, intended to be appropriated to the payment of the national debt; on the credit of which very large ſums have been borrowed for public uſes.

As the funding ſyſtem had been adopted in other countries long before it was reſorted to in Great Britain, a proviſion of this kind had appeared neceſſary at a much earlier period, and had been eſtabliſhed in Holland in 1655, and in the eccleſiaſtical ſtates in 1685. Theſe funds were both formed by the reduction of the intereſt on the public debts, and by appropriating the annual ſum thus ſaved to the gradual diſcharge of the principal.

In the reign of King William, when the mode of providing for extraordinary expences was firſt adopted in this country, the particular tax on which money was borrowed, generally produced much more than was ſufficient to pay the annual intereſt, and the ſurplus was applied in ſinking the principal, which was generally effected in a few years. Had this plan been purſued, there never could have been any great accumulation of public debts; but, as the expenditure increaſed, and the neceſſity of loans of ſtill greater amount became more frequent, it was found difficult to provide for the annual intereſt of the ſums thus borrowed; and the repayment of the principal was either put off to a diſtant period, or left without any proviſion to the chance of more flouriſhing times.

Some of the effects of an accumulating public debt ſoon became evident in the diſcount at which all government ſecurities ſold, and in the difficulties experienced in providing for the annual expenditure; the propriety of reducing, and even of wholly diſcharging, the debt, was generally acknowledged; and the plan of a ſinking fund was recommended in a pamphlet publiſhed in 1701. In 1713 Mr Archibald Hutchiſon preſented to George I. a plan for payment of the public debts. In 1715 different projects for this purpoſe were publiſhed by Edward Leigh, Mr Aſgill, and others. And in 1717 a plan for the gradual diſcharge of the debt was actually adopted, which was afterwards generally known by the name of the ſinking fund.

For a few years the fund was ſtrictly applied to the purpoſes for which it was eſtabliſhed; and ſo well were its nature and importance then underſtood, that money was at the ſame time borrowed for extraordinary expences. In 1724, the ſum of 15,144l. 19s. was taken from the fund, to make good the loſs to the treaſury from the reduction of the value of gold coin; and within 12 years from its eſtabliſhment it was charged with the intereſt of new loans. In 1733, the groſs ſum of half a million was taken from it towards the ſupplies, at which time the medium annual produce of the fund for five years had been 1,212,000l. This amount would have fully diſcharged the debt which then exiſted, but the alienation of it was continued.

This was ſucceeded by the conſolidated fund, one object of which was, to lay the foundation of a new ſinking fund, and conſiſting, like the old one, in the application of the principle of compound intereſt. On this occaſion Mr Pitt conſulted the late Dr Price, who communicated three plans, one of which was afterwards adopted, but with ſuch alterations as greatly affected its efficacy, and which it has been ſince found neceſſary to correct. By the act paſſed for carrying this ſcheme into execution, the annual ſum of 1,000,000l. was placed in the hands of commiſſioners, to be iſſued in four equal quarterly payments, and to be applied either in paying off ſuch redeemable annuities as were at or above par, or in the purchaſe of annuities below par, at the market-price.

On the 17th of February, 1792, Mr Pitt propoſed that the ſum of 400,000l. ſhould be iſſued in addition to the million, for the purpoſe of accelerating the operation of the fund: and ſtated that it might be expected that 25 millions of 3 per cents would be paid off by the year 1800; and that in the year 1808, the fund would amount to 4,000,000l. per annum, the ſum to which it was then reſtricted. The injudicious reſtriction of the fund to 4,000,000l. per annum, was done away by an act paſſed in 1802, which directed that the produce of the two funds ſhould continue to accumulate, without any limitation as to its amount, and be from time to time applied, according to the former proviſions, in the redemption or purchaſe of ſtock, until the whole of the perpetual redeemable annuities, exiſting at the time of paſſing the act, ſhall have been completely paid off. At the ſame time, the annual grant of 200,000l. in aid of the fund, was made a permanent charge, to be iſſued in quarterly payments from the conſolidated fund, in the ſame manner as the original million per annum. In conſequence of theſe improvements, the increaſe of the fund has been much greater than it was originally

originally estimated; and on the 1st of February, 1806, was as follows:

Annual charge by act of 26 Geo. III. - -	L. 1,000,000 0 0
Ditto 42 Geo. III. -	200,000 0 0
Annuities for 99 and 96 years, expired 1792 -	54,880 14 6
Short annuities, expired 1787	25,000 0 0
Life annuities, unclaimed and expired - -	50,308 5 7
Dividend on 98,386,402l. at 3 per cent. - -	2,951,592 1 2
Ditto on 2,617,400l. at 4 per cent.	104,696 0 0
Ditto on 142,000l. at 5 per cent.	7,100 0 0
One per cent. on capitals erected since 1723 -	3,202,672 1 10
Total,	L. 7,596,249 3 1

This sum is exclusive of the fund for the reduction of the public debt of Ireland, which at the above period amounted to 479,537l. 8s. and of the fund for reduction of the imperial debt, which amounted to 56,960l. 9s. 4d.

The progress of the fund from the commencement of its operation on 1st August 1786, to the 1st February 1806, will appear from the following statement of the total amount of the stock redeemed by the commissioners up to the latter period.

Consolidated 3 per cent. annuities	L. 39,922,421
Reduced 3 per cent. annuities	51,493,981
Old South sea annuities	3,492,000
New South sea annuities	2,783,000
Three per cents 1751 -	695,000
Consolidated 4 per cent. annuities	2,617,400
Navy 5 per cent. annuities	142,000
Total,	L. 101,145,802

The total sum which had been paid for this amount of stock was, 62,842,782l. 7s. 10d. the consolidated 3 per cents having been bought up on an average at 61l. per cent. and the reduced at somewhat less.

The progress already made by the fund, and the important effect it has had in supporting the value of the government securities at a time when it has been necessary to borrow unprecedented sums in almost every year, sufficiently demonstrate the great utility of this measure. As its increase will be continually augmenting, it will, if steadily persevered in, and faithfully applied, become ultimately capable of discharging a debt of any amount with which it is possible to suppose the country will ever be encumbered.

SINOPLE, in *Heraldry*, denotes vert, or green colour in armories.—Sinople is used to signify love, youth, beauty, rejoicing, and liberty; whence it is that letters of grace, ambition, legitimation, &c. are always sealed with green wax.

SINUOSITY, a series of bends and turns in arches or other irregular figures, sometimes jutting out and sometimes falling in.

SINUS, in *Anatomy*, denotes a cavity in certain bones and other parts, the entrance whereof is very narrow, and the bottom wider and more spacious.

Sinus, in *Surgery*, a little cavity or sacculus, frequently formed by a wound or ulcer, wherein pus is collected.

SIPHON. See Hydrodynamics.

SIPHONANTHUS, a genus of plants belonging to the class of tetrandria and order of monogynia. See Botany *Index*.

SIPONTUM, Sepuntum, or *Sipus*, in *Ancient Geography*, a town of Apulia, so denominated (according to Strabo) from the great quantity of *sepiæ* or cuttlefish that are thrown upon the coast. Diomede is supposed by the same author to have been the founder of this place; which appears from Livy to have become a colony of Roman citizens. In the early ages of Christian hierarchy, a bishop was fixed in this church; but, under the Lombards, his see was united to that of Beneventum. Being again separated, Sipontum became an archiepiscopal diocese in 1094, about which time it was so ill treated by the Barbarians, that it never recovered its splendour, but sunk into such misery, that in 1260 it was a mere desert, from the want of inhabitants, the decay of commerce, and the insalubrity of the air. Manfred having taken these circumstances into consideration, began in 1261 to build a new city on the sea-shore, to which he removed the few remaining Sipontines. (See the article Manfredonia). Sipontum was situated at the distance of a mile from the shore. Excepting a part of its Gothic cathedral, scarce one stone of the ancient city now remains upon another.

SIPUNCULUS, in *Natural History*, a genus of the class of vermes, and order intestina. See Helminthology *Index*.

SIR, the title of a knight or baronet, which, for distinction's sake, as it is now given indiscriminately to all men, is always prefixed to the knight's Christian name, either in speaking or writing to them.

SIRCAR, any office under the government in Hindostan. It is sometimes used for the state of government itself. Likewise a province, or any number of pergunnahs placed under one head in the government books, for conveniency in keeping accounts. In common usage in Bengal, the under banyans of European gentleman are called *sircars*.

SIRE, a title of honour formerly given to the king of France as a mark of sovereignty.

Sire, was likewise anciently used in the same sense with *sieur* and *seigneur*, and applied to barons, gentlemen, and citizens.

SIRENS, in fabulous history, certain celebrated songstresses who were ranked among the demigods of antiquity. Hyginus places their birth among the consequences of the rape of Proserpine. Others make them daughters of the river Acheloüs and one of the muses*. The number of the Sirens was three, and their names were *Parthenope*, *Lygea*, and *Leucosia*. Some make them half women and half fish; others, half women and half birds. There are antique representations of them still subsisting under both these forms. Pausanias tells us, that the Sirens, by the persuasion of Juno, challenged the Muses to a trial of skill in singing; and these having vanquished them, plucked the golden feathers from the wings of the Sirens, and formed them into crowns,

* Ovid Met. lib. iv.

crowns, with which they adorned their own heads. The Argonauts are ſaid to have been diverted from the enchantment of their ſongs by the ſuperior ſtrains of Orpheus: Ulyſſes, however, had great difficulty in ſecuring himſelf from ſeduction. See *Odyſ.* lib. xii.

Pope, in his notes to the twelfth book of the Odyſſey, obſerves, the critics have greatly laboured to explain what was the foundation of this fiction of the Sirens. We are told by ſome, that the Sirens were queens of certain ſmall iſlands named *Sirenuſæ*, that lie near Capræa in Italy, and chiefly inhabited the promontory of Minerva, upon the top of which that goddeſs had a temple, as ſome affirm, built by Ulyſſes. Here there was a renowned academy, in the reign of the Sirens, famous for eloquence and the liberal ſciences, which gave occaſion to the invention of this fable of the ſweetneſs of the voice and attracting ſongs of the Sirens. But why then are they fabled to be deſtroyers, and painted in ſuch dreadful colours? We are told, that at laſt the ſtudents abuſed their knowledge, to the colouring of wrong, the corruption of manners, and the ſubverſion of government: that is, in the language of poetry, they were feigned to be transformed into monſters, and with their muſic to have enticed paſſengers to their ruin, who there conſumed their patrimonies, and poiſoned their virtues with riot and effeminacy. The place is now called *Maſſa*. Some writers tell us of a certain bay, contracted within winding ſtraits and broken cliffs, which, by the ſinging of the winds and beating of the waters, returns a delightful harmony, that allures the paſſenger to approach, who is immediately thrown againſt the rocks, and ſwallowed up the violent eddies. Thus Horace, moraliſing, calls idleneſs a *Siren*.

> ——*Vitanda eſt improba Siren*
> *Deſidia.*——

But the fable may be applied to all pleaſures in general, which, if too eagerly purſued, betray the incautious into ruin; while wiſe men, like Ulyſſes, making uſe of their reaſon, ſtop their ears againſt their inſinuations.

The learned Mr Bryant ſays, that the Sirens were Cuthite and Canaanitiſh prieſts, who had founded temples in Sicily, which were rendered infamous on account of the women who officiated. They were much addicted to cruel rites, ſo that the ſhores upon which they reſided are deſcribed as covered with the bones of men deſtroyed by their artifice. *Virgil. Æneid.* lib. v. ver. 864.

All ancient authors agree in telling us, that Sirens inhabited the coaſt of Sicily. The name, according to Bochart, who derives it from the Phœnician language, implies a ſongſtreſs. Hence it is probable, ſays Dr Burney, that in ancient times there may have been excellent ſingers, but of corrupt morals, on the coaſt of Sicily, who, by ſeducing voyagers, gave riſe to this fable. And if this conjecture be well founded, he obſerves, the Muſes are not the only pagan divinities who preſerved their influence over mankind in modern times; for every age has its Sirens, and every Siren her votaries; when beauty and talents, doth powerful in themſelves, are united, they become ſtill more attractive.

SIREN, in *Zoology*, a genus of animals belonging to the claſs of *amphibia* and the order of *meantes*. It is a biped, naked, and furniſhed with a tail; the feet are brachiated with claws. This animal was diſcovered by Dr Garden in Carolina; it is found in ſwampy and muddy places, by the ſides of pools, under the trunks of old trees that hang over the water. The natives call it by the name of *mud-inguana*. Linnæus firſt apprehended, that it was the larva of a kind of lizard; but as its fingers are furniſhed with claws, and it makes a croaking noiſe, he concluded from theſe properties, as well as from the ſituation of the anus, that it could not be the larva of the lizard, and therefore formed of it a new genus under the name of *ſiren*. He was alſo obliged to eſtabliſh for this uncommon animal a new order called *meantes* or *gliders*; the animals of which are amphibious, breathing by means of gills and lungs, and furniſhed with arms and claws.

Phil. Tranſ. vol. lvi. p. 189.

SIREX, a genus of inſects belonging to the order of *hymenopteræ*. See ENTOMOLOGY *Index*.

SIRIUM, a genus of plants belonging to the claſs of tetrandria and order of monogynia. See BOTANY *Index*.

SIRIUS, in *Aſtronomy*, a bright ſtar in the conſtellation Canis. See ASTRONOMY, N° 403, &c.

SIRLET, FLAVIUS, an eminent Roman engraver on precious ſtones: his Laocoon, and repreſentations in miniature of antique ſtatues at Rome, are very valuable and ſcarce. He died in 1737.

SIROCCO, a periodical wind which generally blows in Italy and Dalmatia every year about Eaſter. It blows from the ſouth-eaſt by ſouth: it is attended with heat, but not rain; its ordinary period is twenty days, and it uſually ceaſes at ſunſet. When the ſirocco does not blow in this manner, the ſummer is almoſt free from weſterly winds, whirlwinds, and ſtorms. This wind is prejudicial to plants, drying and burning up the buds; though it hurts not men any otherwiſe than by cauſing an extraordinary weakneſs and laſſitude; inconveniences that are fully compenſated by a plentiful fiſhing, and a good crop of corn on the mountains. In the ſummer time, when the weſterly wind ceaſes for a day, it is a ſign that the ſirocco will blow the day following, which uſually begins with a ſort of whirlwind.

Fortis's Travels into Dalmatia, p. 277.

SISKIN. See FRINGILLA, ORNITHOLOGY *Index*.

SISON, BASTARD STONE PARSLEY, a genus of plants belonging to the claſs of pentandria, and to the order of digynia; and in the natural ſyſtem arranged under the 45th order, *umbellatæ*. See BOTANY *Index*.

SISTRUM, or CISTRUM, a kind of ancient muſical inſtrument uſed by the prieſts of Iſis and Oſiris. It is deſcribed by Spon as of an oval form, in manner of a racket, with three ſticks traverſing it breadthwiſe; which playing freely by the agitation of the whole inſtrument, yielded a kind of ſound which to them ſeemed melodious. Mr Malcom takes the ſiſtrum to be no better than a kind of rattle. Oiſelius obſerves, that the ſiſtrum is found repreſented on ſeveral medals, and on taliſmans.

SISYMBRIUM, WATER-CRESES, a genus of plants belonging to the claſs of *tetradynamia*, and to the order of *ſiliquoſa*; and in the natural ſyſtem ranged under the 39th order, *Siliquoſæ*. See BOTANY *Index*.

SISYPHUS, in fabulous hiſtory, one of the deſcendents of Eolus, married Merope, one of the Pleiades, who bore him Glaucus. He reſided at Epyra in Peloponneſus, and was a very crafty man. Others ſay, that he was a Trojan ſecretary, who was puniſhed for diſco-

vering

vering secrets of state; and others again, that he was a notorious robber, killed by Theseus. However, all the poets agree that he was punished in Tartarus for his crimes, by rolling a great stone to the top of a hill, which constantly recoiled, and, rolling down incessantly, renewed his labour.

SISYRINCHIUM, a genus of plants belonging to the class of *gynandria*, and order of *triandria*; and in the natural system ranged under the 5th order, *Ensatæ*. See BOTANY *Index*.

SITE, denotes the situation of an house, &c. and sometimes the ground-plot or spot of earth on which it stands.

SITTA, NUTHATCH, a genus of birds belonging to the order of *picæ*. See ORNITHOLOGY *Index*.

SITOPHYLAX, Σιτοφυλαξ, formed from σιτος "corn," and φυλαξ, "keeper," in antiquity, an Athenian magistrate, who had the superintendence of the corn, and was to take care that nobody bought more than was necessary for the provision of his family. By the Attic laws, particular persons were prohibited from buying more than fifty measures of wheat a man; and that such persons might not purchase more, the sitophylax was appointed to see the laws properly executed. It was a capital crime to prevaricate in it. There were 15 of these *sitophylaces*, ten for the city, and five for the Piræus.

SITUS, in *Algebra* and *Geometry*, denotes the situation of lines, surfaces, &c. Worfius delivers some things in geometry, which are not deduced from common analysis, particularly matters depending on the *situs* of lines and figures. Leibnitz has even founded a particular kind of analysis upon it, called *calculus situs*.

SIVA, a name given by the Hindoos to the Supreme Being, when considered as the avenger or destroyer. Sir William Jones has shown that in several respects the character of Jupiter and Siva are the same. As Jupiter overthrew the Titans and giants, so did Siva overthrow the Daityas, or children of Diti, who frequently rebelled against Heaven; and as during the contest the god of Olympus was furnished with lightning and thunderbolts by an eagle, so Brahma, who is sometimes represented riding on the Garuda, or eagle, presented the god of destruction with fiery shafts. Siva also corresponds with the Stygian Jove, or Pluto; for, if we can rely on a Persian translation of the Bhágavat, the sovereign of Pátála, or the infernal regions, is the king of serpents, named *Seshanaga*, who is exhibited in painting and sculpture, with a diadem and sceptre, in the same manner as Pluto. There is yet another attribute of Siva, or Mahádéva, by which he is visibly distinguished in the drawings and temples of Bengal. To destroy, according to the Vedantis of India, the Sufis of Persia, and many philosophers of our European schools, is only to generate and reproduce in another form. Hence the god of destruction is holden in this country to preside over generation, as a symbol of which he rides on a white bull. Can we doubt that the loves and feats of Jupiter Genitor (not forgetting the white bull of Europa), and his extraordinary title of Lapis, for which no satisfactory reason is commonly given, have a connection with the Indian philosophy and mythology?

Asiatic Researches.

SIUM, WATER PARSNEP, a genus of plants belonging to the class of *pentandria*, and order of *digynia*, and in the natural system ranging under the 44th order, *Umbellatæ*. See BOTANY *Index*.

SIWA, or SIWAH, a town in Egypt to the westward of Alexandria, built on a small fertile spot, surrounded on all sides by desert land. A considerable portion of this space is filled with date trees, but there are also plantains, pomegranates, figs, apricots, and olives; and the gardens are in a very flourishing condition. The people cultivate rice, which is of a reddish colour, and different from that of the delta. The rest of the land furnishes abundance of wheat for the consumption of the inhabitants.

The greatest curiosity about Siwa is a ruin of undoubted antiquity, measuring 32 feet in length, 18 in height, and 15 in breadth, which does not appear ever to have been much larger. Mr Horneman estimates the dimensions of it at 36 feet long, 24 feet wide, and 27 high, which agrees with no other traveller whatever; and indeed Mr Horneman himself allows that the jealousy of the natives prevented him from pursuing any plan of accurate examination or admeasurement. The people of Siwa have no tradition respecting this edifice, nor attribute any quality to it, but that of concealing treasures, and as the haunt of demons. It has, however, been supposed, that Siwa is the *Siropum* of Pliny, and that this building was coeval with the temple of Jupiter Ammon, and a dependency on it; yet neither the natives of Siwa, nor the various tribes of Arabs who frequent that place, know any thing of the ruins of that temple, about which Mr Browne made every possible enquiry.

The complexion of the people of Siwa is generally darker than that of the Egyptians, and their dialect is also different. They do not habitually make use of snuff or tobacco. Their sect is that of Malik. The dress of the lower class is very simple, as they are almost naked; among those whose costume was discernible, it approaches nearer to that of the Arabs of the desert than the Egyptians or Moors. Their clothing consists of a shirt of white cotton, with large sleeves reaching to the feet, a red cap without a turban, and shoes of the same colour. Some earthen ware made by themselves, and a few mats, form the chief part of their household furniture, none but the higher ranks being possessed of copper utensils. They sometimes purchase a few slaves from the Mourzouk caravan. The rest of their wants are supplied from Cairo or Alexandria, whither their dates are transported, both in a dry state, and beaten into mash, which, when good, greatly resembles a sweetmeat. They do not eat large quantities of animal food, and bread known to us is uncommon. They drink plentifully of the liquor extracted from the date tree, which they call *date-tree water*, though it has frequently the power of inebriating in the state in which they drink it. Their animals are the hairy sheep and goat of Egypt, the ass, and a very small number of oxen and camels. The women wear veils as in Egypt. After the rains, the ground in the vicinity of Siwa is covered with salt for many weeks.

Siwa has sometimes been compared to a bee-hive, which it very much resembles, whether in respect to the general appearance of the eminence covered with buildings, the swarm of its people crowded together, or the confused noise, or hum and buzz from its narrow passages and streets, and which reach the ear at a considerable distance. North-west of the town there is a stratum of salt extending a full mile, and near it salt is found on the surface. There are numerous springs, and frequently a spring of water perfectly sweet is found within a few paces of one that is salt. The people, according to Horneman, are obtrusive and thievish. Siwa is situated in 29° 12′ N. Lat. and 44° 54′ E. Long.

SIX-CLERKS, officers in chancery of great account, next in degree below the twelve masters, whose business it is to enrol commissions, pardons, patents, warrants, &c. which pass the great seal, and to transact and file all proceedings by bill, answer, &c. They were anciently *clerici*, and forfeited their places, if they married; but when the constitution of the court began to alter, a law was made to permit them to marry, Stat. 14. and 15. Hen. VIII. cap. 8. They are also solicitors for parties in suits depending in the court of chancery. Under them are six deputies and 60 clerks, who, with the under clerks, do the business of the office.

SIX NATIONS. See NIAGARA.

SIXTH, in *Music*, one of the simple original concords, or harmonical intervals. See INTERVAL.

SIXTUS V. POPE, was born the 13th December, 1521, in La Marca, a village in the seigniory of Montalto. His father, Francis Peretti, was a gardener, and his mother a servant maid. He was their eldest child, and was called Felix. At the age of nine he was hired out to an inhabitant of the village to keep sheep; but disobliging his master, he was soon after degraded to be keeper of the hogs. He was engaged in this employment when Father Michael Angelo Selleri, a Franciscan friar, asked the road to Ascoli, where he was going to preach. Young Felix conducted him thither, and struck the father so much with his conversation and eagerness for knowledge, that he recommended him to the fraternity to which he had come. Accordingly he was received among them, invested with the habit of a lay brother, and placed under the sacristan, to assist in sweeping the church, lighting the candles, and other offices of that nature; for which he was to be taught the responses, and the rudiments of grammar. His progress in learning was so surprising, that at the age of 14 he was thought qualified to begin his noviciate, and was admitted the year following to make his profession.

He pursued his studies with such unwearied assiduity, that he was soon reckoned equal to the best disputants. He was ordained priest in 1545, when he assumed the name of Father Montalto; soon after he took his doctor's degree, and was appointed professor of theology at Sienna. It was then that he so effectually recommended himself to Cardinal di Carpi, and his secretary Bossius, that they ever remained his steady friends. Meanwhile the severity and obstinacy of his temper incessantly engaged him in disputes with his monastic brethren. His reputation for eloquence, which was now spread over Italy, about this time gained him some new friends. Among these were the Colonna family, and Father Ghisilieri, by whose recommendation he was appointed inquisitor-general at Venice: but he exercised that office with so much severity, that he was obliged to flee precipitately from that city. Upon this he went to Rome, where he was made procurator-general of his order, and soon after accompanied Cardinal Buon Compagnon into Spain, as a chaplain and consultor to the inquisition. There he was treated with great respect, and liberal offers were made him to induce him to continue in Spain, which, however, he could not be prevailed on to accept.

In the mean time, news were brought to Madrid that Pius IV. was dead. and that Father Ghisilieri, who had been made Cardinal Alexandrino by Paul IV. had succeeded him under the name of Pius V. These tidings filled Montalto with joy, and not without reason, for he was immediately invested by the pontiff with new dignities. He was made general of his order, bishop of St Agatha, was soon after raised to the dignity of cardinal, and received a pension. About this time he was employed by the pope to draw up the bill of excommunication against Queen Elizabeth.

He began now to cast his eyes upon the papacy; and, in order to obtain it, formed and executed a plan of hypocrisy with unparalleled constancy and success. He became humble, patient, and affable. He changed his dress, his air, his words, and his actions, so completely, that his most intimate friends declared him a new man. Never was there such an absolute victory gained over the passions; never was a fictitious character so long maintained, nor the foibles of human nature so artfully concealed. He courted the ambassadors of every foreign power, but attached himself to the interests of none; nor did he accept a single favour that would have laid him under any peculiar obligation. He had formerly treated his relations with the greatest tenderness, but he now changed his behaviour altogether. When his brother Anthony came to visit him, he lodged him in an inn, and sent him home next day, charging him to inform his family that he was now dead to his relations and the world.

When Pius V. died in 1572, he entered the conclave with the other cardinals, but seemed altogether indifferent about the election, and never left his apartment except to his devotion. When solicited to join any party, he declined it, declaring that he was of no consequence, and that he would leave the choice of a pope entirely to persons of greater knowledge and experience. When Cardinal Buon Compagnon, who assumed the name of Gregory XIII. was elected, Montalto assured him that he never wished for any thing so much in his life, and that he would always remember his goodness, and the favours he had conferred on him in Spain. But the new pope treated him with the greatest contempt, and deprived him of his pension. The cardinals also, deceived by his artifices, paid him no greater respect, and used to call him, by way of ridicule, the Roman beast; the ass of La Marca.

He now assumed all the infirmities of old age; his head hung down upon his shoulders; he tottered as he walked, and supported himself on a staff. His voice became feeble, and was often interrupted by a cough so exceedingly severe, that it seemed every moment to threaten his dissolution. He interfered in no public transactions, but spent his whole time in acts of devotion and benevolence. Mean time he constantly employed the ablest spies, who brought him intelligence of every particular.

When Gregory XIII. died in 1585, he entered the conclave with the greatest reluctance, and immediately shut himself up in his chamber, and was no more thought of than if he had not existed. When he went to

Sixtus. to mafs, for which purpofe alone he left his apartment, he appeared perfectly indifferent about the event of the election. He joined no party, yet flattered all.

He knew early that there would be great divifions in the conclave, and he was aware that when the leaders of the different parties were difappointed in their own views, they all frequently agreed in the election of fome old and infirm cardinal, the length of whofe life would merely enable them to prepare themfelves fufficiently for the next vacancy. Thefe views directed his conduct, nor was he miftaken in his hopes of fuccefs.

Three cardinals, the leaders of oppofite factions, being unable to procure the election which each of them wifhed, unanimoufly agreed to make choice of Montalto. When they came to acquaint him with their intention, he fell into fuch a violent fit of coughing that every perfon thought he would expire on the fpot. He told them that his reign would laft but a few days; that, befides a continual difficulty of breathing, he wanted ftrength to fupport fuch a weight, and that his fmall experience rendered him very unfit for fo important a charge. He conjured them all three not to abandon him, but to take the whole weight of affairs upon their own fhoulders; and declared that he would never accept the mitre upon any other terms: "If you are refolved," added he, "to make me pope, it will only be placing yourfelves on the throne. For my part, I fhall be fatisfied with the bare title. Let the world call me pope, and I make you heartily welcome to the power and authority. The cardinals fwallowed the bait, and exerted themfelves fo effectually that Montalto was elected. He now pulled off the mafk which he had worn for 14 years. No fooner was his election fecured, than he ftarted from his feat, flung down his ftaff in the middle of the hall, and appeared almoft a foot taller than he had done for feveral years.

When he was afked, according to cuftom, if he would accept of the papacy, he replied, "It is trifling to afk whether I will accept what I have already accepted.— However, to fatisfy any fcruple that may arife, I tell you that I accept it with great pleafure, and would accept another if I could get it; for I find myfelf able, by the Divine affiftance, to manage two papacies." His former complaifance and humility difappeared, together with his infirmities, and he now treated all around him with referve and haughtinefs. The firft care of Sixtus V. the name which Montalto affumed, was to correct the abufes, and put a ftop to the enormities, which were daily committed in every part of the ecclefiaftical ftate. The lenity of Gregory's government had introduced a general licentioufnefs of manners, which burft forth with great violence, after that pontiff's death. It had been ufual with former popes to releafe delinquents on the day of their coronation, who were therefore accuftomed to furrender themfelves voluntary prifoners immediately after the election of the pope. At prefent, however, they were fatally difappointed.— When the governor of Rome and the keeper of St Angelo waited on his Holinefs, to know his intention in this particular, he replied, "What have you to do with pardons, and releafing of prifoners? Is it not fufficient that our predeceffor has fuffered the judges to remain unemployed thefe 13 years? Shall we alfo ftain our pontificate with the fame neglect of juftice? We have too long feen, with inexpreffible concern, the prodigious degree of wickednefs that reigns in the ftate, to think of granting pardons. Let the prifoners be brought to a fpeedy trial, and punifhed as they deferve, to fhow the world that Divine Providence has called us to the chair of St Peter, to reward the good, and chaftife the wicked: that we bear not the fword in vain, but are the minifters of God, and a revenger to execute wrath on them that do evil."

He appointed commiffioners to infpect the conduct of the judges, difplaced thofe who were inclined to lenity, and put others of fevere difpofitions in their room. He offered rewards to any perfon who could convict them of corruption or partiality. He ordered the fyndics of all the towns and figniories to make out a complete lift of the diforderly perfons within their diftricts, and threatened the ftrapado for the fmalleft omiffion. In confequence of this edict, the fyndic of Albino was fcourged in the market place, becaufe he had left his nephew, an incorrigible libertine, out of his lift.

He made very fevere laws againft robbers and affaffins. Adulterers, when difcovered, fuffered death; and they who willingly fubmitted to the proftitution of their wives, a cuftom then common in Rome, received the fame punifhment. He was particularly careful of the purity of the female fex, and never forgave thofe who attempted to debauch them.

His execution of juftice was as prompt as his edicts were rigorous. A Swifs happening to give a Spanifh gentleman a blow with his halberd, was ftruck by him fo rudely with a pilgrim's ftaff that he expired on the fpot. Sixtus informed the governor of Rome that he was to dine early, and that juftice muft be executed on the criminal before he fat down to table. The Spanifh ambaffador and four cardinals intreated him not to difgrace the gentleman by fuffering him to die on a gibbet, but to order him to be beheaded. "He fhall be hanged (replied Sixtus), but I will alleviate his difgrace by doing him the honour to affift perfonally at his death." He ordered a gibbet to be erected before his own windows, where he continued fitting during the whole execution. He then called to his fervants to bring in dinner, declaring that the act of juftice which he had juft feen had increafed his appetite. When he rofe from table, he exclaimed, "God be praifed for the good appetite with which I have dined!"

When Sixtus afcended the throne, the whole ecclefiaftical ftate was infefted with bands of robbers, who from their numbers and outrages, were exceedingly formidable; by his prudent and vigorous conduct, however, he in a fhort time extirpated the whole of thefe banditti.

Nor was the vigour of his conduct lefs confpicuous in his tranfactions with foreign nations. Before he had been pope two months he quarrelled with Philip II. of Spain, Henry III. of France, and Henry king of Navarre. His intrigues indeed in fome meafure influenced all the councils of Europe.

After his acceffion to the pontificate he fent for his family to Rome, with exprefs orders that they fhould appear in a decent and modeft manner. Accordingly, his fifter Camilla came thither, accompanied by her daughter and two grandchildren. Some cardinals, in order to pay court to the pope, went out to meet her, and introduced her in a very magnificent drefs. Sixtus pretended not to know her, and afked two or three times

Sixtus.

times who she was: Upon this one of the cardinals said, "It is your sister, holy father." "I have but one sister (replied Sixtus with a frown), and she is a poor woman at Le Grotte; if you have introduced her in this disguise, I declare I do not know her; yet I think I would know her again, if I saw her in the clothes she used to wear."

Her conductors at last found it necessary to carry her to an inn, and strip her of her finery. When Camilla was introduced a second time, Sixtus embraced her tenderly, and said, "Now we know indeed that it is our sister: nobody shall make a princess of you but ourselves." He stipulated with his sister, that she should neither ask any favour in matters of government, nor intercede for criminals, nor interfere in the administration of justice; declaring that every request of that kind would meet with a certain refusal. These terms being agreed to, and punctually observed, he made the most ample provision not only for Camilla but for his whole relations.

This great man was also an encourager of learning. He caused an Italian translation of the Bible to be published, which raised a good deal of discontent among the Catholics. When some cardinals reproached him for his conduct in this respect, he replied, "It was published for the benefit of you cardinals who cannot read Latin."

Sixtus died in 1590, after having reigned little more than five years. His death was ascribed to poison, said to have been administered by the Spaniards; but the story seems rather improbable.

It was to the indulgence of a disposition naturally formed for severity, that all the defects of this wonderful man are to be ascribed. Clemency was a stranger to his bosom; his punishments were often too cruel, and seemed sometimes to border on revenge. Pasquin was dressed one morning in a very nasty shirt, and being asked by Marforio why he wore such dirty linen? replied, that he could get no other, for the pope had made his washerwoman a princess, alluding to Camilla, who had formerly been a laundress. The pope ordered strict search to be made for the author of this lampoon, and offered him his life and a thousand pistoles if he would discover himself. The author was simple enough to make his appearance and claim the reward. "It is true (said the pope) we made such a promise, and we shall keep it; your life shall be spared, and you shall receive the money presently: but we have reserved to ourselves the power of cutting off your hands and boring your tongue through, to prevent your being so witty for the future." It is needless to add, that the sentence was immediately executed. This, however, is the only instance of his resenting the many severe satires that were published against him.

But though the conduct of Sixtus seldom excites love, it generally commands our esteem, and sometimes our admiration. He strenuously defended the cause of the poor, the widow, and the orphan: he never refused audience to the injured, however wretched or forlorn their appearance was. He never forgave those magistrates who were capable of partiality or corruption; nor suffered crimes to pass unpunished, whether committed by the rich or the poor. He was frugal, temperate, sober, and never neglected to reward the smallest favour which had been conferred on him before his exaltation.

Sixtus, Sizar.

When he mounted the throne, the treasury was not only exhausted, but in debt: at his death it contained five millions of gold.

Rome was indebted to him for several of her greatest embellishments, particularly the Vatican library: it was by him, too, that trade was first introduced into the Ecclesiastical State.

SIYA-GHUSH, the caracal of Buffon, an animal of the cat kind. See FELIS, MAMMALIA *Index*.

SIZAR, or SIZER, in Latin *Sizator*, an appellation by which the lowest order of students in the universities of Cambridge and Dublin are distinguished, is derived from the word *size*, which in Cambridge, and probably in Dublin likewise, has a peculiar meaning. To *size*, in the language of the university, is to get any sort of victuals from the kitchens, which the students may want in their own rooms, or in addition to their commons in the hall, and for which they pay the cooks or butchers at the end of each quarter. A size of any thing is the smallest quantity of that thing which can be thus bought: two sizes, or a part of beef, being nearly equal to what a young person will eat of that dish to his dinner; and a size of ale or beer being equal to half an English pint.

The sizars are divided into two classes, viz. subsizatores or sizars, and sizatores or proper sizars. The former of these are supplied with commons from the table of the fellows and fellow commoners; and in former times, when these were more scanty than they are now, they were obliged to supply the deficiency by sizing, as is sometimes the case still. The proper sizars had formerly no commons at all, and were therefore obliged to size the whole. In St John's college they have now some commons allowed them for dinner, from a benefaction, but they are still obliged to size their suppers: in the other colleges they are allowed a part of the fellow-commons, but must size the rest; and from being thus obliged to size the whole or part of their victuals, the whole order derived the name of *sizars*.

In Oxford, the order similar to that of sizar is denominated *servitor*, a name evidently derived from the menial duties which they perform. In both universities these orders were formerly distinguished by round caps and gowns of different materials from those of the pensioners or commoners, the order immediately above them. But about 30 years ago the round cap was entirely abolished in both seminaries. There is still, however, in Oxford, we believe, a distinction in the gowns, and there is also a trifling difference in some of the small colleges in Cambridge; but in the largest colleges the dress of the pensioners and sizars is entirely the same.

In Oxford, the servitors are still obliged to wait at table on the fellows and gentlemen-commoners; but much to the credit of the university of Cambridge, this most degrading and disgraceful custom was entirely abolished about 10 or 12 years ago, and of course the sizars of Cambridge are now on a much more respectable footing than the servitors of Oxford.

The sizars are not upon the foundation, and therefore while they continue sizars are not capable of being elected

elected fellows; but they may at any time, if they choose, become pensioners: and they generally sit for scholarships immediately before they take their first degree. If successful, they are then on the foundation, and are entitled to become candidates for fellowships when they have got that degree. In the mean time, while they continue sizars, besides free commons they enjoy many benefactions, which have been made at different times, under the name of *sizar's prætor*, *exhibitions*, &c. and the rate of tuition, the rent of rooms, and other things of that sort within their respective colleges, is less than to the other orders. But though their education is thus obtained at a less expence, they are not now considered as a menial order; for sizars, pensioner-scholars, and even sometimes fellow-commoners, mix together with the utmost cordiality. It is worthy of remark, that at every period this order has supplied the university with its most distinguished officers; and that many of the most illustrious members of the church, many of the most distinguished men in the other liberal professions, have, when under-graduates, been sizars, when that order was on a less respectable footing than it is now.

SIZE, the name of an instrument used for finding the bigness of fine round pearls. It consists of thin pieces or leaves, about two inches long, and half an inch broad, fastened together at one end by a rivet. In each of these are round holes drilled of different diameters. Those in the first leaf serve for measuring pearls from half a grain to seven grains; those of the second, for pearls from eight grains or two carats to five carats, &c.; and those of the third, for pearls from six carats and a half to eight carats and a half.

SIZE, is also a sort of paint, varnish, or glue, used by painters, &c.

The shreds and parings of leather, parchment, or vellum, being boiled in water and strained, make size. This substance is much used in many trades.—The manner of using size is to melt some of it over a gentle fire; and scraping as much whiting into it as will just colour it, let them be well incorporated together; after which you may whiten frames, &c. with it. After it dries, melt the size again, and put more whiting, and whiten the frames, &c. seven or eight times, letting it dry between each time: but before it is quite dry, between each washing with size, you must smooth and wet it over with a clean brush-pencil in fair water.

To make gold-size. Take gum-anime and asphaltum, of each one ounce; minium, litharge of gold, and amber, of each half an ounce: reduce all into a very fine powder, and add to them four ounces of linseed oil, and eight ounces of drying oil: digest them over a gentle fire that does not flame, so that the mixture may only simmer, but not boil; lest it should run over and set the house on fire, stir it constantly with a stick till all the ingredients are dissolved and incorporated, and do not leave off stirring till it becomes thick and ropy; after being sufficiently boiled, let it stand till it is almost cold, and then strain it through a coarse linen cloth, and keep it for use.—To prepare it for working, put what quantity you please in a horse-muscle shell, adding as much oil of turpentine as will dissolve it; and making it as thin as the bottom of your shell-like varnish, hold it over a candle, and then strain it through a linen-rag into another shell; add to these as much vermilion as will make it of a darkish red: if it is too thick for drawing, you may thin it with some oil of turpentine. The chief use of this size is for laying on metals.

The best gold size for burnishing is made as follows: Take fine bole, what quantity you please; grind it finely on a piece of marble, then scrape into it a little beef suet; grind all well together; after which mix in a small proportion of parchment-size with a double proportion of water, and it is done.

To make silver-size. Take tobacco-pipe clay in fine powder, into which scrape some black-lead and a little Genoa soap, and grind them all together with parchment size as already directed.

SKATING, an exercise on ice, both graceful and healthy. Although the ancients were remarkable for their dexterity in most of the athletic sports, yet skating seems to have been unknown to them. It may therefore be considered as a modern invention; and probably it derived its origin in Holland, where it was practised, not only as a graceful and elegant amusement, but as an expeditious mode of travelling when the lakes and canals were frozen up during winter. In Holland long journeys are made upon skates with ease and expedition; but in general less attention is there paid to graceful and elegant movements, than to the expedition and celerity of what is called *journey skating*. It is only in those countries where it is considered as an amusement, that its graceful attitudes and movements can be studied; and there is no exercise whatever better calculated to set off the human figure to advantage. The acquirement of most exercises may be attained at an advanced period of life; but to become an expert skater, it is necessary to begin the practice of the art at a very early age. It is difficult to reduce the art of skating to a system. It is principally by the imitation of a good skater that a young practitioner can form his own practice. The English, though often remarkable for feats of agility upon skates, are very deficient in gracefulness; which is partly owing to the construction of the skates. They are too much curved in the surface which embraces the ice, consequently they involuntarily bring the users of them round on the outside upon a quick and small circle; whereas the skater, by using skates of a different construction, less curved, has the command of his stroke, and can enlarge or diminish the circle according to his own wish and desire. The metropolis of Scotland has produced more instances of elegant skaters than perhaps any other country whatever; and the institution of a skating club about 50 years ago, has contributed not a little to the improvement of this elegant amusement. We are indebted for this article to a gentleman of that club, who has made the practice and improvement of skating his particular study; and as the nature of our work will not permit the insertion of a full treatise on skating, we shall present our readers with a few instructions.

Those who wish to be proficients should begin at an early period of life; and should first endeavour to throw off the fear which always attends the commencement of an apparently hazardous amusement. They will soon acquire a facility of moving on the inside: when they have done this, they must endeavour to acquire the movement on the outside of the skate; which is nothing more than throwing themselves upon the outer edge of the skate, and making the balance of their body tend

towards

towards that ſide, which will neceſſarily enable them to form a ſemicircle. In this, much aſſiſtance may be derived from placing a bag of lead-ſhot in the pocket next to the foot employed in making the outſide ſtroke, which will produce an artificial poiſe of the body, which afterwards will become natural by practice. At the commencement of the outſide ſtroke, the knee of the employed limb ſhould be a little bended, and gradually brought to a rectilineal poſition when the ſtroke is completed. When the practitioner becomes expert in forming the ſemicircle with both feet, he is then to join them together, and proceed progreſſively and alternately with both feet, which will carry him forward with a graceful movement. Care ſhould be taken to uſe very little muſcular exertion, for the impelling motion ſhould proceed from the mechanical impulſe of the body thrown into ſuch a poſition as to regulate the ſtroke. At taking the outſide ſtroke, the body ought to be thrown forward eaſily, the unemployed limb kept in a direct line with the body, and the face and eyes directly looking forward: the unemployed foot ought to be ſtretched towards the ice, with the toes in a direct line with the leg. In the time of making the curve, the body muſt be gradually, and almoſt imperceptibly, raiſed, and the unemployed limb brought in the ſame manner forward; ſo that, at finiſhing the curve, the body will bend a ſmall degree backward, and the unemployed foot will be about two inches before the other, ready to embrace the ice and form a correſpondent curve. The muſcular movement of the whole body muſt correſpond with the movement of the ſkate, and ſhould be regulated ſo as to be almoſt imperceptible to the ſpectators. Particular attention ſhould be paid in carrying round the head and eyes with a regular and imperceptible motion; for nothing ſo much diminiſhes the grace and elegance of ſkating as ſudden jerks and exertions, which are too frequently uſed by the generality of ſkaters. The management of the arms likewiſe deſerves attention. There is no mode of diſpoſing of them more gracefully in ſkating outſide, than folding the hands into each other, or uſing a muff.

There are various feats of activity and manœuvres uſed upon ſkates; but they are ſo various that we cannot pretend to detail them. Moving on the outſide is the primary object for a ſkater to attain; and when he becomes an adept in that, he will eaſily acquire a facility in executing other branches of the art. There are few exerciſes but will afford him hints of elegant and graceful attitudes. For example, nothing can be more beautiful than the attitude of drawing the bow and arrow whilſt the ſkater is making a large circle on the outſide: the manual exerciſe and military ſalutes have likewiſe a pretty effect when uſed by an expert ſkater.

SKELETON, in *Anatomy*, the dried bones of any animal joined together by wires, or by the natural ligament dried, in ſuch a manner as to ſhow their poſition when the creature was alive.

We have, in the Philoſophical Tranſactions, an account of a human ſkeleton, all the bones of which were ſo united, as to make but one articulation from the back to the os ſacrum, and downwards a little way. On ſawing ſome of them, where they were unnaturally joined, they were found not to cohere throughout their whole ſubſtance, but only about a ſixth of an inch deep all round. The figure of the trunk was crooked, the ſpinæ making the convex, and the inſide of the vertebræ the concave part of the ſegment. The whole had been found in a charnel-houſe, and was of the ſize of a full grown perſon.

SKIDS, or SKEEDS, in ſea-language, are long compaſſing pieces of timber, notched below ſo as to fit cloſely upon the wales, extending from the main-wale to the top of the ſide, and retained in this poſition by bolts or ſpike-nails. They are intended for preſerving the planks of the ſide, when any heavy body is hoiſted or lowered.

SKIE, ISLE OF. See SKYE.

SKIFF, a ſmall boat reſembling a yawl, uſually employed for paſſing rivers.

SKIMMER, BLACK. See RHYNCHOPS, ORNITHOLOGY *Index*.

SKIMMIA, a genus of plants belonging to the tetrandria claſs; and in the natural method ranking under the 40th order, *Perſonatæ*. See BOTANY *Index*.

SKIN, in *Anatomy*, the general covering of the body of any animal. See ANATOMY, N° 74.

SKIN, in *Commerce*, is particularly uſed for the membrane ſtripped off the animal to be prepared by the tanner, ſkinner, parchment-maker, &c. and converted into leather, &c. See TANNING.

SKINNER, STEPHEN, an Engliſh antiquarian, was born in 1622. He travelled, and ſtudied in ſeveral foreign univerſities during the civil wars; and in 1654, returned and ſettled at Lincoln, where he practiſed phyſic with ſucceſs until the year 1667, when he died of a malignant fever. His works were collected in folio in 1671, by Mr Henſhaw, under the title of *Etymologicon Linguæ Anglicanæ*, &c.

SKIPPER, or SAURY, a ſpecies of fiſh. See ESOX, ICHTHYOLOGY *Index*.

SKIRMISH, in *War*, a ſlight engagement between ſmall parties, without any regular order; and is therefore eaſily diſtinguiſhed from a *battle*, which is a general engagement between two armies continued for ſome time.

SKIRMISH Bay, the name given by Lieutenant Broughton to a bay in an iſland which was diſcovered by him in latitude 43° 48′ ſouth, and in longitude 183° eaſt. The Chatham armed tender worked up into the bay, and came to anchor about a mile from the ſhore. When the captain and ſome of the people landed, they found the natives ſo extremely inhoſpitable, that ſelf-preſervation made it neceſſary to fire upon them. The land is of conſiderable magnitude, whether iſland or continent, and what they ſaw of it extended nearly 40 miles from eaſt to weſt, and the appearance of the country they regarded as very promiſing. The natives reſemble thoſe of New Zealand, from which they are diſtant about 100 leagues, but their ſkins were deſtitute of any marks, and they ſeemed to be cleanly in their perſons. Their dreſſes were of ſeal ſkin, while ſome had fine mats faſtened round the waiſt. Mr Broughton ſays, "on our firſt landing, their ſurpriſe and exclamations can hardly be imagined; they pointed to the ſun, and then to us, as if to aſk whether we had come from thence?" The arms they made uſe of were clubs, ſpears, and a ſmall weapon reſembling the patoo of New Zealand.

SKULL, in *Anatomy*, the bony caſe in which the brain is encloſed. See ANATOMY, N° 11, &c.

Skull || Skye.

SKULL-Cap. See SCUTELLARIA, BOTANY *Index*.

SKY, the blue expanfe of air or atmofphere. For the reafon of its blue colour and concave figure, fee OPTICS, N° 223.

SKYE, one of the greateft of the Weftern iflands of Scotland, fo called from *Skianach*, which in the Erfe dialect fignifies *winged*, becaufe the two promontories of Valernefs and Toternifh, by which it is bounded on the north-weft and north-eaft, are fuppofed to refemble wings. The ifland lies between the fhire of Rofs and the weftern part of Lewis. According to the computation of Mr Pennant, Dr Johnfon, and Dr Campbell, it is 60 miles in length, and nearly the fame in width where broadeft; according to others it is 50 miles in length, and in fome places 30 broad. The ifland of Skye was formerly divided between two proprietors; the fouthern part belonged to the laird of Macleod, faid to be lineally defcended from Leod fon to the black prince of Man, but part of this divifion has fallen into other hands: the northern diftrict is the property of Lord Macdonald, whofe anceftor was Donald, king or lord of the ifles, and chief of the numerous clan of Macdonalds, who are counted the moft warlike of all the Highlanders. Skye is part of the fhire of Invernefs, and formerly belonged to the diocefe of the Ifles: on the fouth it is parted from the main land by a channel three leagues in breadth; though, at the ferry of Glenelg, it is fo narrow that a man may be heard calling for the boat from one fide to the other. Skye is well provided with a variety of excellent bays and harbours.

The face of the country is roughened with mountains, fome of which are fo high as to be covered with fnow on the top at midfummer; in general, their fides are clothed with heath and grafs, which afford good pafturage for fheep and black cattle. Between the mountains there are fome fertile valleys, and the greater part of the land towards the fea-coaft is plain and arable. The ifland is well watered with a great number of rivers, above 30 of which afford falmon; and fome of them produce black mufcles in which pearls are bred, particularly the rivers Kilmartin and Ord: Martin was affured by the proprietor of the former, that a pearl hath been found in it valued at 20l. Sterling. Here is alfo a confiderable number of frefh-water lakes well ftored with trout and eels. The largeft of thefe lakes takes its denomination from St Columba, to whom is dedicated a chapel that ftands upon a fmall ifle in the middle of the lake. Skye likewife affords feveral cataracts, that roar down the rocks with great impetuofity. That the ifland has been formerly covered with woods, appears from the large trunks of fir and other trees daily dug out of the bogs and peat-marfhes in every part of the country.

Statiftical Account of Scotland, vol. xvi. p. 140.

From the height of the hills, and proximity of the fea, the air feldom continues long of the fame temperature; fometimes it is dry, oftener moift, and in the latter end of winter and beginning of fpring cold and piercing; at an average, three days in twelve throughout the year fcarcely free from rain, far lefs from clouds. Thefe, attracted by the hills, fometimes break in ufeful and refrefhing fhowers; at other times fuddenly burfting, pour down their contents with tremendous noife, in impetuous torrents that deluge the plains below, and render the fmalleft rivulet impaffable; which, together with the ftormy winds fo common in this country in the months of Auguft and September, frequently blaft the hopes, and difappoint the expectations, of the hufbandman. Snow has been often known to lie on the ground from three to feven weeks; and on the higheft hills, even in the middle of June, fome fpots of it are to be feen. To this various temperature of the air, and uncertainty of weather, the fevers and agues, headachs, rheumatifms, colds, and dyfenteries, which are the prevailing diftempers, may be afcribed. That it is far, however, from being unwholefome, is fufficiently evinced by experience; for the inhabitants are, in general, as ftrong and healthy, and arrive at as advanced an age, as thofe who live in milder climates, and under a ferener fky. The gout is fcarcely known in this ifland.

Skye.

The foil is generally black, though it likewife affords clay of different colours; fuch as white, red, and blue, and in fome places fuller's earth. It is, however, much lefs adapted for agriculture than for pafture, and feldom, unlefs, in very good years, fupplies itfelf with a fufficiency of provifions. Yet, though the foil is not very fertile or rich, it might with proper management be made to produce more plentiful crops. But the generality of the farmers are fo prejudiced in favour of old cuftoms, and indeed fo little inclined to induftry, that they will not eafily be prevailed on to change them for better; efpecially if the alteration or amendment propofed be attended with expence. Therefore, with refpect to improvements in agriculture, they are ftill much in the fame ftate as they were 20 or 30 years ago. Ploughs, on a new and improved model, that in comparifon to the advantages derived from them might be had at a moderate expence, have lately been introduced into feveral diftricts around, where their good effects are manifeft in improving the crops and diminifhing the labour of man and beaft; but the laird of Raafay and one other gentleman are the only perfons in Portree that have ufed them. The *cafcroim*, a crooked kind of fpade, is almoft the only inftrument for labouring the ground ufed among the ordinary clafs of tenants. The average crops of corn are 8000 bolls.

When Mr Knox vifited this ifland in 1786, the number of inhabitants amounted to 15,000: but between 1790-98, according to the Statiftical Hiftory of Scotland, the population is only 14,470.

Various minerals are found in Skye, but none have been wrought to any advantage. Near the village of Sartle, the natives find black and white marcafites, and variegated pebbles. The Applefglen, in the neighbourhood of Lochfallart, produces beautiful agates of different colours: ftones of a purple hue are, after great rains, found in the rivulets: cryftal, of different colours and forms, abounds in feveral parts of the ifland, as well as black and white marble, free-ftone, lime-ftone, and talc: fmall red and white coral is found on the fouthern and weftern coafts in great abundance. The fuel confifts chiefly of peat and turf, which are impregnated with iron ore; and coal has been difcovered in feveral diftricts; but it does not appear to be worth working.

The wild birds of all forts moft common in the country, are, folan geefe, gulls, cormorants, cranes, wild geefe, and wild ducks; eagles, crows, ravens, rooks, cuckoos, rails, woodcocks, moor-fowl, partridges, plover, wild pigeons, and blackbirds, owls, hawks, fnipes, and a variety of ſmall birds. In mild ſeaſons, the cuckoo and rail appear in the latter end of April; the former diſappears always before the end of June; the latter ſometimes not till September. The woodcock comes in October, and frequently remains till March. The tame ſorts of fowl are geeſe, ducks, turkeys, cocks, pullets, and tame pigeons.

The black cattle are here expoſed to all the rigours of the ſevere winter, without any other provender than the tops of the heath and the alga marina; ſo that they appear like mere ſkeletons in the ſpring; though, as the graſs grows up, they ſoon become plump and juicy, the beef being ſweet, tender, and finely interlarded.—The amphibious animals are ſeals and otters. Among the reptiles may be reckoned vipers, aſps, frogs, toads, and three different kinds of ſerpents; the firſt ſpotted black and white, and very poiſonous; the ſecond yellow, with brown ſpots; and the third of a brown colour, the ſmalleſt and leaſt poiſonous.

Whales, and cairbans or ſun-fiſh, come in ſometimes to the ſounds after their prey, but are rarely purſued with any ſucceſs. The fiſhes commonly caught on the coaſt are herrings, ling, cod, ſkate, haddock, mackerel, lythe, ſye, and dog-fiſh. The average price of ling at home is 13l. 13s. per ton; when ſold, one by one, if freſh, the price is from 3d. to 5d.; if cured, from 5d. to 7d. The barrel of herrings ſeldom ſells under 19s. which is owing to the great difficulty of procuring ſalt, even ſometimes at any price; and the ſame cauſe prevents many from taking more than are ſufficient for their own uſe.

The kyle of Scalpe teems with oyſters, in ſuch a manner, that after ſome ſpring-tides, 20 horſe-loads of them are left upon the ſands. Near the village of Bernſtill, the beach yields muſcles ſufficient to maintain 60 perſons per day; this providential ſupply helps to ſupport many poor families in times of ſcarcity.

The people are ſtrong, robuſt, healthy, and prolific. They generally profeſs the Proteſtant religion; are honeſt, brave, innocent, and hoſpitable. They ſpeak the language, wear the habit, and obſerve the cuſtoms that are common to all the Hebrides. The meconium in new-born infants is purged away with freſh butter: the children are bathed every morning and evening in water, and grow up ſo ſtrong, that a child of 10 months is able to walk alone: they never wear ſhoes or ſtockings before the age of eight or ten, and night-caps are hardly known; they keep their feet always wet; they lie on beds of ſtraw or heath, which laſt is an excellent reſtorative: they are quick of apprehenſion, ingenious, and very much addicted to muſic and poetry. They eat heartily of fiſh; but ſeldom regale themſelves with fleſh-meat: their ordinary food conſiſts of butter, cheeſe, milk, potatoes, colewort, brochan, and a diſh called *oon*, which indeed is no other than the froth of boiled milk or whey raiſed with a ſtick like that uſed in making chocolate.

A ſort of coarſe woollen cloth called *cloa*, or *caddoes*, the manufacture of their wives, made into ſhort jackets and trouſers, is the common dreſs of the men. The philibeg is rarely worn, except in ſummer and on Sundays; on which days, and ſome other occaſions, thoſe in better circumſtances appear in tartans, a bonnet, and ſhort hoſe, and ſome in a hat, ſhort coat, waiſtcoat, and breeches, of Scotch or Engliſh manufacture. The women are in general very cleanly, and ſo exceſſively fond of dreſs, that many maid-ſervants are often known to lay out their whole wages that way.

There are two fairs held annually at Portree, to which almoſt every part of Sky ſends cattle. The firſt is held in the end of May, and the ſecond in the end of July. The fair commonly continues from Wedneſday till the Saturday following. The commodities which are ſold in theſe are horſes, cows, ſheep, goats, hides, butter, cheeſe, fiſh, and wool. The cattle ſold in theſe fairs ſwim over to the main land through a mile or half a mile of ſea. Thouſands of theſe are yearly exported, at from 2l. to 3l. each. Many of them are driven to England, where they are fatted for the market, and counted delicious eating.

In Skye appear many ruins of Daniſh forts, watch-towers, beacons, temples, and ſepulchral monuments. All the forts are known by the term *Dun;* ſuch as Dun-Skudborg, Dun-Derig, Dun-Skerineſs, Dun-David, &c.

SKY-Colour. To give this colour to glaſs, ſet in the furnace a pot of pure metal of fritt from rochetta or barilla, but the rochetta fritt does beſt; as ſoon as the metal is well purified, take for a pot of twenty pounds of metal ſix ounces of braſs calcined by itſelf; put it by degrees at two or three times into the metal, ſtirring and mixing it well every time, and diligently ſkimming the metal with a ladle: at the end of two hours the whole will be well mixed, and a proof may be taken; if the colour be found right, let the whole ſtand 24 hours longer in the furnace, and it will then be fit to work, and will prove of a moſt beautiful ſky colour.

SLAB, an outſide ſappy plank or board ſawed off from the ſides of a timber-tree. The word is alſo uſed for a flat piece of marble.

SLAB-Line, in ſea-language, a ſmall cord paſſing up behind a ſhip's main-ſail, or fore-ſail, and being reeved through a block attached to the lower part of the yard, is thence tranſmitted in two branches to the foot of the ſail, to which it is faſtened. It is uſed to truſs up the ſail as occaſion requires, and more particularly for the convenience of the pilot or ſteerſman, that they may look forward beneath it as the ſhip advances.

SLACK-WATER, in ſea-language, denotes the interval between the flux and reflux of the tide, or between the laſt of the ebb and the firſt of the flood, during which the current is interrupted, and the water apparently remains in a ſtate of reſt.

SLACKEN, in *Metallurgy*, a term uſed by miners to expreſs a ſpongy and ſemivitrified ſubſtance which is mixed with the ores of metals, to prevent their fuſion. It is the ſcoria or ſcum ſeparated from the ſurface of the former fuſions of metals. To this is frequently added limeſtone, and ſometimes a kind of coarſe iron-ore, in the running of the poorer gold ores.

SLATE, a ſtone of a compact texture and laminated ſtructure, ſplitting into fine plates, ſome varieties of which are employed for covering houſes. See *Clay-Slate*, under MINERALOGY, p. 185. See alſo GEOLOGY.

SLAVE. See SLAVERY.

SLAVERY is a word, of which though generally underſtood, it is not eaſy to give a proper definition. An excellent moral writer has defined it to be "an obligation to labour for the benefit of the maſter, without the contract or conſent of the ſervant." But may not he 1 Slavery defined.

Slavery. be properly called a ſlave who has given up his freedom to diſcharge a debt which he could not otherwiſe pay, or who has thrown it away at a game of hazard? In many nations, debts have been legally diſcharged in this manner; and in ſome ſavage tribes, ſuch is the univerſal ardour for gaming, that it is no uncommon thing for a man, after having loſt at play all his other property, to ſtake, on a ſingle throw of dice, himſelf, his wife, and his children (A). That perſons who have thus loſt their liberty are ſlaves, will hardly be denied; and ſurely the infatuated gameſter is a ſlave by his own contract. The debtor, too, if he was aware of the law, and contracted debts larger than he could reaſonably expect to be able to pay, may juſtly be conſidered as having come under an obligation to labour for the benefit of a maſter *with his own conſent*; for every man is anſwerable for all the known conſequences of his voluntary actions.

This definition of ſlavery ſeems to be defective as well as inaccurate. A man may be under an obligation to labour through life for the benefit of a maſter, and yet that maſter have no right to diſpoſe of him by ſale, or in any other way to make him the property of a third perſon; but the word *ſlave*, as uſed among us, always denotes a perſon who may be bought and ſold like a beaſt in the market (B). In its original ſenſe, indeed, it was of the ſame import with *noble*, *illuſtrious*; but vaſt numbers of the people among whom it had that ſignification being, in the decline of the Roman empire, ſold by their countrymen to the Venetians, and by them diſperſed over all Europe, the word *ſlave* came to denote a perſon in the loweſt ſtate of ſervitude, who was conſidered as the abſolute property of his maſter. See PHILOLOGY, N° 220.

2
Inequalities of rank inevitable. As nothing can be more evident than that all men have, by the law of nature, an equal right to life, liberty, and the produce of their own labour (ſee RIGHT, N° 5.), it is not eaſy to conceive what can have firſt led one part of them to imagine that they had a right to enſlave another. Inequalities of rank are indeed inevitable in civil ſociety; and from them reſults that ſervitude which is founded in contract, and is of temporary duration. (See MORAL PHILOSOPHY, N° 141.) He who has much property has many things to attend to, and muſt be diſpoſed to hire perſons to aſſiſt and ſerve him; while thoſe who have little or no property muſt be equally willing to be hired for that purpoſe. And if the maſter be kind, and the ſervant faithful, they will both be happier in this connection than they could have been out of it. But from a ſtate of ſervitude, where the ſlave is at the abſolute diſpoſal of his maſter in all things, and may be transferred without his own conſent from one proprietor to another, like an ox or an aſs, happineſs muſt be for ever baniſhed. How then came a traffic ſo unnatural and unjuſt as that of ſlaves to be originally introduced into the world? Slavery.

The common anſwer to this queſtion is, that it took its riſe among ſavages, who, in their frequent wars with each other, either maſſacred their captives in cold blood, or condemned them to perpetual ſlavery. In ſupport of this opinion we have heard it obſerved, that the Latin word *ſervus*, which ſignifies not a *hired* ſervant, but a *ſlave*, is derived from *ſervare*, "to preſerve;" and that ſuch men were called *ſervi*, becauſe they were captives, whoſe lives were preſerved on the condition of their becoming the property of the victor.

That ſlavery had its origin from war, we think extremely probable (C), nor are we inclined to controvert this etymology of the word *ſervus*; but the traffic in men prevailed almoſt univerſally long before the Latin language or Roman name was heard of; and there is no good evidence that it began among ſavages. The word עבד, in the Old Teſtament, which in our verſion is rendered *ſervant*, ſignifies literally a *ſlave*, either born in the family or bought with money, in contradiſtinction to שכיר, which denotes a hired ſervant: and as Noah makes uſe of the word עבד in the curſe which he denounces upon Ham and Canaan immediately after the deluge, it would appear that ſlavery had its origin before that event. If ſo, there can be little doubt but that it began among thoſe violent perſons whom our tranſlators have called *giants* *, though the original word נפלים literally ſignifies *aſſaulters of others*. Thoſe wretches ſeem firſt to have ſeized upon women, whom they forcibly compelled to miniſter to their pleaſures; and from this kind of violence the progreſs was natural to that by which they enſlaved their weaker brethren among the men, obliging them to labour for their benefit, without allowing them fee or reward.

3 Origin of ſlavery.

4 Prior to the deluge.

* Gen. vi. 4.

4 Nimrod enſlaved his captives.

After the deluge the firſt dealer in ſlaves ſeems to have been Nimrod. "He began," we are told, "to be a mighty one in the earth, and was a mighty hunter before the Lord." He could not, however, be the firſt hunter of wild beaſts; for that ſpecies of hunting muſt have been practiſed from the beginning; nor is it probable that his dexterity in the chaſe, which was then the univerſal employment, could have been ſo far ſuperior to that of all his contemporaries, as to entitle him to the appellation of the "the mighty hunter before the Lord." Hence moſt commentators have concluded, that he was a hunter of men; an opinion which they think receives ſome countenance from the import of his name, the word *Nimrod* ſignifying a rebel. Whatever be

(A) Aleam (quod mirere) ſobrii inter ſeria exercent, tanta lucrandi perdendive temeritate, ut cum omnia defecerunt, extremo ac noviſſimo jactu de libertate et corpore contendant. Victus voluntariam ſervitutem adit; quamvis junior, quamvis robuſtior, alligari ſe ac venire patitur.—*Tacitus de Mor. Germ.*

The ſavages of North America are equally addicted to gaming with the ancient Germans, and the negroes on the Slave Coaſt of Guinea perhaps ſtill more.

(B) The Roman orator's definition of *ſlavery*, Parad. V. is as accurate as any that we have ſeen. "Servitus eſt obedientia fracti animi et abjecti et arbitrio carentis ſuo;" whether the unhappy perſon fell into that ſtate with or without his own contract or conſent.

(C) In the article SOCIETY, the reader will find another account of the origin of ſlavery, which we think likewiſe probable, though we have not transferred it to this place; as it would, in our opinion, be wrong to give to one writer what we know to belong to another. It may be proper, however, to obſerve here, that between the two articles there is no contradiction, as barbarous wars were certainly *one* ſource of ſlavery.

Slavery.

be in this, there can be little doubt but that he became a mighty one by violence; for being the ſixth ſon of his father, and apparently much younger than the other five, it is not likely that his inheritance exceeded theirs either in extent or in population. He enlarged it, however, by conqueſt; for it appears from Scripture, that he invaded the territories of Aſhur the ſon of Shem, who had ſettled in Shinar; and obliging him to remove into Aſſyria, he ſeized upon Babylon, and made it the capital of the firſt kingdom in the world. As he had great projects in view, it ſeems to be in a high degree probable that he made bond-ſervants of the captives whom he took in his wars, and employed them in building or repairing the metropolis of his kingdom; and hence we think is to be dated the origin of poſtdiluvian ſlavery.

6
Slavery in the days of Abraham.

That it began thus early can hardly be queſtioned; for we know that it prevailed univerſally in the age of Abraham, who was born within ſeventy years after the death of Nimrod. That patriarch had three hundred and eighteen ſervants or ſlaves, born in his own houſe, and trained to arms, with whom he purſued and conquered the four kings who had taken captive his brother's ſon †. And it appears from the converſation which took place between him and the king of Sodom after the battle, that both believed the conqueror had a right to conſider his priſoners as part of his ſpoil. "Give me (ſays the king) the *perſons*, and take the *goods* to thyſelf." It is indeed evident from numberleſs paſſages of ſcripture, that the domeſtics whom our tranſlators call *ſervants* were in thoſe days univerſally conſidered as the moſt valuable part of their maſter's property, and claſſed with his flocks and herds. Thus when the ſacred hiſtorian deſcribes the wealth of Abraham, he ſays, that "he had ſheep and oxen, and he aſſes, and men-ſervants, and maid-ſervants, and ſhe-aſſes, and camels." And when Abimelech wiſhed to make ſome reparation to the patriarch for the unintended injury that he had done him, "he took ſheep and oxen, and men-ſervants, and women-ſervants, and gave them unto Abraham, and reſtored to him Sarah his wife." The riches and power of Iſaac and Jacob are eſtimated in the very ſame manner. Of the former it is ſaid, that "the man waxed great, and went forward and grew, until he became very great: for he had poſſeſſion of flocks, and poſſeſſion of herds, and great ſtore of ſervants, ועבדה of ſlaves; and the Philiſtines envied him." The latter, we are told, "increaſed exceedingly, and had much cattle, and maid-ſervants, and men-ſervants, and camels, and aſſes ‡."

† Gen. xiv.

‡ Gen. xii. 16. xx. 14. xxiv. 35. xxvi. 13, 14. xxx. 43.

That the practice of buying and ſelling ſervants thus early begun among the patriarchs deſcended to their poſterity, is known to every attentive reader of the Bible. It was expreſsly authoriſed by the Jewiſh law, in which are many directions how ſuch ſervants were to be treated. They were to be bought only of the heathen; for if an Iſraelite grew poor and ſold himſelf either to diſcharge a debt, or to procure the means of ſubſiſtence, he was to be treated not as a ſlave עבד, but as a hired ſervant שכיר, and reſtored to freedom at the year of Jubilee. "Both thy bond-men and thy bond maids (ſays Moſes) ſhall be of the heathen that are round about you: of them ſhall ye buy bond men and bond maids. And ye ſhall take them as an inheritance for your children after you, to inherit them for a poſſeſſion; they ſhall be your bond-men for ever ||." Unlimited as the power thus given to the Hebrews over their bond-ſervants of heathen extraction appears to have been, they were ſtrictly prohibited from acquiring ſuch property by any other means than fair purchaſe: "he that *ſtealeth* a man and ſelleth him," ſaid their great lawgiver, "ſhall ſurely be put to death §."

7
Authoriſed by the Mosaic law.

|| Lev. xxv. 39, 40, 44, 46.

§ Lev. xxi. 16.

Whilſt ſlavery, in a mild form, was permitted among the people of God, a much worſe kind of it prevailed among the heathen nations of antiquity. With other abominable cuſtoms, the traffic in men quickly ſpread from Chaldea into Egypt, Arabia, and over all the eaſt, and by degrees found its way into every known region under heaven (D).

8
Spread over the whole world.

Of this hateful commerce we ſhall not attempt to trace the progreſs through every age and country, but ſhall content ourſelves with taking a tranſient view of it among the Greeks and Romans, and a few other nations, in whoſe cuſtoms and manners our readers muſt be intereſted.

9
Slavery among the Greeks and

One can hardly read a book of the Iliad or Odyſſey, without perceiving that, in the age of Homer, all priſoners of war were liable to be treated as ſlaves, and compelled, without regard to their rank, ſex, or years, to labour for their maſters in offices of the vileſt drudgery. So univerſally was this cruel treatment of captives admitted to be the right of the victor, that the poet introduces Hector in the very act of taking a tender and perhaps laſt farewell of his wife, when it was ſurely his buſineſs to afford her every conſolation in his power, telling her, as a thing of courſe which could not be concealed, that, on the conqueſt of Troy, ſhe would be compelled

> To bear the victor's hard commands, or bring
> The weight of water from Hyperia's ſpring (E).
>
> POPE.

At that early period, the Phœnicians, and probably the Greeks themſelves, had ſuch an eſtabliſhed commerce in ſlaves, that, not ſatisfied with reducing to bondage their priſoners of war, they ſcrupled not to kidnap in cold blood

---

(D) If credit be due to a late account of China, the people of that vaſt empire have never made merchandiſe of men or women. The exception, however, is ſo ſingular, that we ſhould be glad to ſee it better authenticated; for it is apparent from works of the moſt undoubted credit, that over all the other eaſtern countries with which we are acquainted ſlavery has prevailed from time immemorial, and that ſome of the Indian nations make long journeys into Africa for the ſole purpoſe of buying ſlaves.

(E) In thoſe early times drawing water was the office of the meaneſt ſlaves. This appears from Joſhua's curſe upon the Gibeonites who had deceived him —"Now therefore ye are curſed, and there ſhall none of you be freed from being bond-men, and hewers of wood, and drawers of water, for the houſe of my God." To this ſtate of bondage Homer makes Hector ſay, that Andromache would *neceſſarily* be brought upon the deſtruction of Troy; κρατερη δ' επικεισετ' αναγκη.—*Iliad.* lib. vi.

Slavery. blood persons who had never kindled their resentment, in order to supply their foreign markets. In the 14th book of the Odyssey, Ulysses represents himself as having narrowly escaped a snare of this kind laid for him by a false Phœnician, who had doomed the hero to Libyan slavery: and as the whole narrative, in which this circumstance is told, is an artful fiction, intended to have the appearance of truth to an Ithacan peasant, the practice of kidnapping slaves could not then have appeared incredible to any inhabitant of that island.

Such were the manners of the Greeks in the heroic age; nor were they much improved in this respect at periods of greater refinement. Philip of Macedon having conquered the Thebans, not only sold his captives, but even took money for permitting the dead to be buried *; and Alexander, who had more generosity than Philip, afterwards razed the city of Thebes, and sold the inhabitants, men, women, and children, for slaves †. This cruel treatment of a brave people may indeed be supposed to have proceeded, in the first instance, from the avarice of the conqueror; and in the second, from the momentary resentment of a man who was savage and generous by turns, and who had no command of his passions. We shall not positively assign it to other causes; but from the manner in which the Spartans behaved to their slaves, there is little reason to imagine that had they received from the Thebans the same provocation with Alexander, they would have treated their captives with greater lenity. "At Sparta (says a humane and elegant writer) slaves were treated with a degree of rigour that is hardly conceivable; although to them, as their husbandmen and artificers, their proud and idle masters were indebted for all the necessaries of life. The Lacedemonian youth, trained up in the practice of deceiving and butchering those poor men, were from time to time let loose upon them, in order to show their proficiency in stratagem and massacre. And once, without any provocation, and merely for their own amusement, we are told that they murdered three thousand in one night, not only with the connivance of law, but by its avowed permission. Such, in promoting the happiness of one part of society and the virtue of another, are the effects of slavery."

* *Justin.* lib. III. cap. 4.

† *Justin et Arrian*

Beattie's Moral Science, vol. II.

It has been said, that in Athens and Rome slaves were better treated than in Sparta: but in the former city their treatment cannot have been good, or their lives comfortable, when the Athenians relished that tragedy of Euripides in which Hecuba, the wife of Priam, is introduced as lamenting that she was chained like a dog at Agamemnon's gate? Of the estimation in which slaves were held in Rome, we may form a tolerable notion from the well-known fact, that one of those unhappy beings was often chained at the gate of a great man's house, to give admittance to the guests invited to a feast *. In the early periods of the commonwealth it was customary, in certain sacred shews exhibited on solemn occasions, to drag through the circus a slave, who had been scourged to death holding in his hand a fork in the form of a gibbet †. But we need not multiply proofs of the cruelty of the Romans to their slaves. If the inhuman combats of the gladiators (see GLADIATORS) admit of any apology on account of the martial spirit with which they were thought to inspire the spectators, the conduct of Vedius Pollio must have proceeded from the most wanton and brutal cruelty. This man, who flourished not in the earliest periods of the republic, when the Romans were little better than a savage banditti, but in the polished age of Augustus, frequently threw such slaves as gave him the slightest offence into his fishponds to fatten his lampreys; and yet he was suffered to die in peace! The emperor, indeed, upon coming to the knowledge of his cruelty, ordered his lampreys to be destroyed, and his ponds to be filled up; but we do not recollect that any other punishment was inflicted on the savage master. Till the reign of the same emperor the depositions of slaves were never admitted in the courts of judicature; and then they were received only when persons were accused of treasonable practices.

10 Romans.

* *Kames's Sketches.*

† *Cicero de Div.* lib. I. cap. 26.

11 Origin of Roman slavery.

The origin of slavery in Rome was the same as in every other country. Prisoners of war were of course reduced to that state, as if they had been criminals. The dictator Camillus, one of the most accomplished generals of the republic, sold his Hetrurian captives to pay the Roman ladies for the jewels which they had presented to Apollo. Fabius, whose cautious conduct saved his country when Hannibal was victorious in Italy, having subdued Tarentum, reduced 30,000 of the citizens to slavery, and sold them to the highest bidder. Coriolanus, when driven from Rome, and fighting for the Volsci, scrupled not to make slaves of his own countrymen; and Julius Cæsar, among whose faults wanton cruelty has never been reckoned, sold at one time fifty-three thousand captives for slaves. Nor did the slaves in Rome consist only of foreigners taken in war. By one of the laws of the twelve tables, creditors were empowered to seize their insolvent debtors, and keep them in their houses till, by their services or labour, they had discharged the sum they owed: and in the beginning of the commonwealth they were authorised to sell such debtors, and even to put them to death (F). The children of slaves were the property not of the commonwealth, or of their own parents, but of their masters; and thus was slavery perpetuated in the families of such unhappy

(F) After a certain number of citations, the law granted to the debtor thirty days of grace to raise the sum for which he was accountable. The words of the law are: "Æris confessi, rebusque jure judicatis, triginti dies justi sunto. Post dein manum endojacito.—Vincito aut nervo, aut compedibus." When the debt is confessed, and the trial passed, let there be thirty days of forbearance; afterwards lay hands on him; bind him either with a cord or fetters." After the thirty days were expired, if the debtor had not discharged the debt, he was led to the prætor, who delivered him over to the mercy of his creditors; these bound him and kept him in chains for the space of sixty days. Afterwards, for three market-days successively, the debtor was brought to the tribunal of the prætor; then a public crier proclaimed in the forum the debt for which the prisoner was detained. It often happened, that rich persons redeemed the prisoner by paying his debts; but if nobody appeared in behalf of the debtor after the third market-day, the creditor had a right to inflict the punishments appointed by the law. "Tertiis nundinis capite unhappy men as fell into that ſtate, whether through the chance of war or the cruelty of a ſordid creditor (G). The conſequence was, that the number of ſlaves belonging to the rich patricians was almoſt incredible. Caius Cæcilius Iſidorus, who died about ſeven years before the Chriſtian era, left to his heirs 4116 ſlaves; and if any one of thoſe wretched creatures made an unſucceſsful attempt to regain his liberty, or was even ſuſpected of ſuch a deſign, he was marked on the forehead with a red-hot iron (H). In Sicily, during the moſt flouriſhing periods of the commonwealth, it ſeems to have been cuſtomary for maſters to mark their ſlaves in this manner; at leaſt we know that ſuch was the practice of Damophilus, who, not ſatisfied with this ſecurity, ſhut up his ſlaves every night in cloſe priſons, and led them out like beaſts in the morning to their daily labour in the field. Hence aroſe the ſervile war in Sicily.

12
Its duration.

Though many laws were enacted by Auguſtus and other patriotic emperors to diminiſh the power of creditors over their inſolvent debtors; though the influence of the mild ſpirit of Chriſtianity tended much to meliorate the condition of ſlaves, even under Pagan maſters; and though the emperor Adrian made it capital to kill a ſlave without a juſt reaſon; yet this infamous commerce prevailed univerſally in the empire for many ages after the converſion of Conſtantine to the religion of Chriſt. It was not indeed completely aboliſhed even in the reign of Juſtinian; and in many countries which had once been provinces of the empire it continued long after the empire itſelf had fallen to pieces.

13
Slavery among the ancient Germans.

It has already been obſerved, that among the ancient Germans it was not uncommon for an ardent gameſter to loſe his perſonal liberty by a throw of the dice. This was indeed a ſtrong proof of ſavage manners; but the general condition of ſlaves among thoſe ſavages ſeems to have been much better than among the poliſhed Greeks and Romans. In Germany the ſlaves were generally attached to the ſoil, and only employed in tending cattle, and carrying on the buſineſs of agriculture; for the menial offices of every great man's houſe were performed by his wife and children. Such ſlaves were ſeldom beaten, or chained, or impriſoned. Sometimes indeed they were killed by their maſters in a fit of ſudden paſſion; but none were conſidered as materials of commerce, except thoſe who had originally been freemen, and loſt their freedom by play. Theſe, indeed, the ſucceſsful gameſter was very ready to ſell, both because he felt them an uſeleſs burden, and becauſe their preſence continually put him in mind of that ſtate to which a throw of the dice might one day reduce himſelf.

Such is the account which Tacitus gives * of ſlavery among the ancient Germans. The Anglo-Saxons, however, after they were ſettled in this iſland ſeem not to to have carried on that traffic ſo honourably. By a ſtatute of Alfred the Great †, the purchaſe of a *man*, a *horſe*, or an *ox*, without a voucher to warrant the ſale, was ſtrictly forbidden. That law was, doubtleſs, enacted to prevent the *ſtealing* of *men* and cattle; but it ſhows us that ſo late as the ninth or tenth century a man, when fairly purchaſed, was, in England, as much the property of the buyer as the horſe on which he rode, or the ox which dragged his plough. In the ſame country, now ſo nobly tenacious of freedom and the rights of man, a ſpecies of ſlavery ſimilar to that which prevailed among the ancient Germans ſubſiſted even to the end of the ſixteenth century. This appears from a commiſſion iſſued by Queen Elizabeth in 1574, for inquiring into the lands and goods of all her *bond-men* and *bond women* in the counties of Cornwall, Devon, Somerſet, and Gloucester, in order to compound with them for their manumiſſion, that they might enjoy their lands and goods as freemen ‡. In Scotland there certainly exiſted an order of ſlaves or bond-men, who tilled the ground, were attached to the ſoil, and with it were transferable from one proprietor to another, at a period ſo late as the thirteenth century; but when or how thoſe villains, as they were called, obtained their freedom, ſeems to be unknown to every lawyer and antiquary of the preſent day. Coalliers and ſalters were, in the ſame country, ſlaves till little more than 30 years ago, that they were manumitted by an act of the Britiſh legiſlature, and reſtored to the rights of freemen and citizens. Before that period the ſons of coalliers could follow no buſineſs but that of their fathers; nor were they at liberty to ſeek employment in any other mines than thoſe to which they were attached by birth, without the conſent of the lord of the manor, who, if he had no uſe for their ſervices himſelf, transferred them by a written deed to ſome neighbouring proprietor.

capite pœnas dato aut trans Tiberim peregre venumduito;" that is, "Let him on the third market-day be puniſhed with death, or ſold beyond the Tiber as a ſlave." If there were ſeveral creditors, they were allowed, in conſequence of this ſevere law, to divide the body of the priſoner into ſeveral parts, and ſhare it among them in proportion to the ſum which they demanded.

(G) This is evident from the ſtory of Appius and Virginia. See ROME, N° 113.

(H) How capriciouſly and unjuſtly this infamous mark was impreſſed, we learn from the ſtory of Reſtio. This man being proſcribed, and a reward offered for his head by the triumvirs Octavianus, Antony, and Lepidus, concealed himſelf from the fury of the tyrants in the beſt way that he could. A ſlave whom he had marked with the hot iron having found out the place of his retreat, conducted him to a cave, and there ſupported him for ſome time with what he earned by his daily labour. At length a company of ſoldiers coming that way, and approaching the cave, the faithful ſlave, alarmed at the danger his maſter was in, followed them cloſe, and falling upon a poor peaſant, killed him in their preſence, and cut off his head, crying out, "I am now revenged on my maſter for the marks with which he has branded me." The ſoldiers, ſeeing the infamous marks on his forehead, and not doubting but he had killed Reſtio, ſnatched the head out of his hand, and returned with it in all haſte to the triumvirs. They were no ſooner gone, than the ſlave conveyed his maſter to the ſea-ſide, where they had the good luck to find one of Sextius Pompeius's veſſels, which tranſported them ſafe into Sicily.

Slavery.

of hiſtory exempted from this opprobrium of our nature which ſpread over all the reſt of the world, the enlightened reader will not ſuppoſe. It is indeed in that vaſt country that ſlavery has in every age appeared in its uglieſt form. We have already obſerved, that about the era of the Trojan war, a commerce in ſlaves was carried on between Phœnicia and Libya: and the Carthaginians, who were a colony of Phœnicians, and revered the cuſtoms, manners, and religion of their parent ſtate, undoubtedly continued the Tyrian traffic in human fleſh with the interior tribes of Africa. Of this we might reſt aſſured, although we had no other evidence of the fact than what reſults from the practice of human ſacrifices ſo prevalent in the republic of Carthage. The genuine inſtincts of nature are often ſubdued by dire ſuperſtition, but they cannot be wholly eradicated; and the rich Carthaginian, when a human victim was demanded from him to the gods, would be ready to ſupply the place of his own child by the ſon of a poor ſtranger, perfidiouſly purchaſed at whatever price. That this was, indeed, a very common practice among them, we learn from the teſtimony of various hiſtorians *, who aſſure us, that when Agathocles the tyrant of Syracuſe had overthrown their generals Hanno and Bomilcar, and threatened Carthage itſelf with a ſiege, the people attributed their misfortunes to the juſt anger of Saturn for having been worſhipped, for ſome years, by the ſacrifices of children meanly born and ſecretly *bought*, inſtead of thoſe of noble extraction. Theſe ſubſtitutions of one offering for another were conſidered as a profane deviation from the religion of their forefathers; and therefore to expiate the guilt of ſo horrid an impiety, a ſacrifice of 200 children of the firſt rank was on that occaſion made to the bloody god. As the Carthaginians were a commercial people, we cannot ſuppoſe that they purchaſed ſlaves only for ſacrifices. They undoubtedly condemned many of their priſoners of war to the ſtate of ſervitude, and either ſold them to foreigners, or diſtributed them among their ſenators and the leaders of their armies. Hanno, who endeavoured to uſurp the ſupreme power in Carthage whilſt that republic was engaged in war with Timoleon in Sicily †, armed 20,000 of his ſlaves in order to carry his nefarious purpoſe into execution; and Hannibal, after his deciſive victory at Cannæ, ſold to the Greeks many of his priſoners whom the Roman ſenate refuſed to redeem ‡. That illuſtrious commander was indeed more humane, as well as more politic, than the generality of his countrymen. Before his days it was cuſtomary with the Carthaginians either to maſſacre their captives in cold blood, that they might never again bear arms againſt them, or to offer them in ſacrifice as a grateful acknowledgement to the gods by whoſe aſſiſtance they believed that they were vanquiſhed; but this was not always done even by their moſt ſuperſtitious or moſt unprincipled leaders. Among other rich ſpoils which Agathocles, after his victory already mentioned, found in the camp of Hanno and Bomilcar, were twenty thouſand pair of fetters and manacles, which thoſe generals had provided for ſuch of the Sicilian priſoners as they intended to preſerve alive and reduce to a ſtate of ſlavery.

And Numidians.

With the ancient ſtate of the other African nations we are but very little acquainted. The Numidians, Mauritanians, Getulians, and Garamantes, are indeed mentioned by the Roman hiſtorians, who give us ample details of the battles which they fought in attempting to preſerve their national independence; but we have no particular account of their different manners and cuſtoms in that age when Rome was diſputing with Carthage the ſovereignty of the world. All the African ſtates of which we know any thing, were in alliance with one or other of thoſe rival republics; and as the people of thoſe ſtates appear to have been leſs enlightened than either the Romans or the Carthaginians, we cannot ſuppoſe that they had purer morals, or a greater regard for the ſacred rights of man, than the powerful nations by whom they were either protected or oppreſſed. They would, indeed, inſenſibly adopt their cuſtoms; and the ready market which Marius found for the priſoners taken in the town Capſa, although Salluſt acknowledges ‡ that the ſale was contrary to the laws of war, ſhows that ſlavery was then no ſtrange thing to the Numidians. It ſeems indeed to have prevailed through all Africa from the very firſt peopling of that unexplored country; and we doubt if in any age of the world the unhappy negro was abſolutely ſecure of his perſonal freedom, or even of not being ſold to a foreign trader.

‡ *Bell. Jug.* cap. 91.

18
Slave-trade with the coaſt of Guinea begun not by the Portugueſe,

It is the common opinion that the practice of making ſlaves of the negroes is of a very modern date; that it owes its origin to the incurſions of the Portugueſe on the weſtern coaſt of Africa; and that but for the cunning or cruelty of Europeans, it would not now exiſt, and would never have exiſted. But all this is a complication of miſtakes. A learned writer has lately proved, with a force of evidence which admits of no reply *, that from the coaſt of Guinea a great trade in ſlaves was carried on by the Arabs ſome hundreds of years before the Portugueſe embarked in that traffic, or had even ſeen a woolly-headed negro. Even the wandering Arabs of the deſert, who never had any friendly correſpondence with the Chriſtians of Europe, have from time immemorial been ſerved by negro ſlaves. "The Arab muſt be poor indeed (ſays M. Saugnier) not to have at leaſt one negro ſlave. His ſole occupation is the care of the herd. They are never employed in war, but they have it in their power to marry. Their wives, who are captive negreſſes, do all the domeſtic work, and are roughly treated by the Arabian women, and by the Arabs themſelves. Their children are ſlaves like them, and put to all kinds of drudgery." Surely no man whoſe judgement is not completely warped by prejudice, will pretend that thoſe roving tribes of ſavages, ſo remarkable for their independent ſpirit and attachment to ancient cuſtoms, learned to enſlave the negroes from the Europeans. In all probability they have, without interruption, continued the practice of ſlavery from the days of their great anceſtor Iſhmael; and it ſeems evident, that *none of the European nations had ever ſeen a woolly headed negro till the year* 1100, when the cruſaders fell in with a ſmall party of them near the town of Hebron in Judea, and were ſo ſtruck with the novelty of their appearance, that the army burſt into a general fit of laughter *. Long before the cruſades, however, we know with certainty that the natives of Guinea had been expoſed to ſale in foreign countries. In 651 the Mahometan Arabs of Egypt ſo haraſſed the king of Nubia or Ethiopia, who was a Chriſtian, that he agreed to ſend them annually, by way of tribute, a *vaſt number of Nubian or Ethiopian*

* *Whitaker's Review of Gibbon's Roman Hiſtory.*

pian ſlaves into Egypt. Such a tribute as this at that time, we are told, was more agreeable to the khalif than any other, as the Arabs then made *no ſmall account of thoſe ſlaves* *.

* *Modern Univerſal Hiſtory*, vol. i. 525.

The very propoſal of ſuch a tribute, and the eſtimation in which black ſlaves were held in Egypt, ſhows that a commerce in bond-ſervants could not then be a new branch of trade either to the Arabs or the Ethiopians; but the vaſt number which the Ethiopian monarch was now compelled to furniſh every year, induced him to feed this great drain upon his ſubjects from the natives of the neighbouring countries. "He ranged accordingly into all that vaſt *blank of geography* upon the map of the world, the ſpreading boſom of the African continent; and even puſhed through it to its fartheſt extremities in the weſt. He thus brought the blacks of Guinea, for the firſt time, into the ſervice and families of the eaſt; and the ſlaves which he paid in tribute to the Arabs, whether derived from the nearer neighbourhood of Ethiopia, fetched from the mediterranean regions of Africa, or brought from the diſtant ſhores of the Atlantic, were all denominated *Ethiopians*, from the country by which they were conveyed into Egypt †. "At this time, therefore, according to Mr Whitaker, began that kind of traffic in human fleſh

† *Whitaker's Review.*

"Which ſpoils unhappy Guinea of its ſons."

There are not many authors from whom, in queſtions of antiquity, we differ with greater heſitation; but, as we meet with a female Ethiopian ſlave in the Eunuch of Terence, we cannot help ſuſpecting that Guinea was occaſionally "ſpoiled of its ſons" at a much earlier period. At any rate, from the obſervations made by the European travellers who firſt penetrated into that continent, it appears undeniable that ſlavery muſt have prevailed from time immemorial among ſuch of the tribes as had never carried on any commerce with foreign nations. When Battel firſt viſited the Giagas *, thoſe people had never before ſeen a white man; yet they welcomed him and the Engliſh, with whom he had come, to their country, invited them to bring their goods on ſhore, and without heſitation loaded the ſhips with ſlaves. The Giagas were indeed waging war with the kingdom of Benguela; and being cannibals, who prefer human fleſh to all others, the ſlaves whom they had ſold to the Engliſh were probably priſoners whom they would have killed and eaten if they had not found an opportunity of otherwiſe diſpoſing of them to greater advantage. But as they had not been incited by the Europeans to eat their priſoners, there can be no reaſon to ſuppoſe that by the Europeans they had been firſt induced to ſell them; for we have ſeen that this kind of commerce prevailed in Africa among people much more poliſhed than the Giagas ſo early as in the reign of Jugurtha.

20
The negroes have enſlaved one another from time immemorial.

* *Modern Univerſal Hiſtory*, vol. ... chap. 47. ſect. ...

That it was not introduced among the negroes either by the Arabs or by the Portugueſe, appears ſtill more evident from the behaviour of the Dahomans at the conqueſt of Whidah, and from the manner in which the people of Angola at the earlieſt ſtage of their foreign trade procured a ſupply of ſlaves for the Portugueſe market. The greater part of the ſlaves whom the Angolans exported from St Paulo de Loanda were brought from interior countries, ſome hundreds of leagues diſtant, where they could not have been regularly purchaſed had that commerce been till then unknown in thoſe countries. The Dahomans, in the beginning of the year 1727, had never ſeen a white man: and when their victorious prince and his army, in their rout through Whidah, firſt met with ſome Europeans in the town of Sabi, they were ſo ſhocked at their complexion and their dreſs, that they were afraid to approach them, and could not be perſuaded that they were men till they heard them ſpeak, and were aſſured by the Whidaneſe that theſe were the merchants who purchaſed all the ſlaves that were ſold in Guinea †. Slavery, therefore, if it prevailed among the Dahomans before that period, could not have been introduced among them by European or Arabian intrigues: but we are aſſured by Snelgrave, who was then in the army, that thoſe people treated their captives with ſuch horrid cruelty as was ſhocking to the natives of the ſea-coaſt, and leaves no room for doubt but that ſlavery had been practiſed among them from the earlieſt ages. A great part of their priſoners were ſacrificed to their gods or eaten by the ſoldiers; and when our author expreſſed to a colonel of the guard ſome ſurpriſe that a prince ſo enlightened as the ſovereign of Dahomy ſhould ſacrifice ſo many men whom he might have ſold to great advantage, he was gravely told, that it had been the cuſtom of their nation, from time immemorial, to offer, after victory, a certain number of priſoners to the gods; and that they ſelected the old men for victims, becauſe they were of leſs value at market, and more dangerous from their experience and cunning, than the young men. To thoſe perſons who fancy that the wars between the African princes are carried on for the ſole purpoſe of ſupplying the European ſhips with ſlaves, it may be proper to remark, that one of the kings of Dahomy ſlaughtered at once not only all the captives taken in war, but alſo 127 priſoners of different kinds, that he might have a ſufficiency of ſkulls to adorn the walls of his palace; though at the very time of that maſſacre he *knew* that there were ſix ſlave-ſhips in the road of Whidah, from which he could have got for every prime ſlave a price little ſhort of thirty pounds ſterling ‡.

† *Modern Univerſal Hiſtory*, vol. xiii.

Theſe facts, and numberleſs others which the reader will find detailed in the 13th volume of the Modern Univerſal Hiſtory, by writers who were at the greateſt pains to procure authentic information; who were neither biaſſed by intereſt nor blinded by enthuſiaſm; and who appear to have held the infamous traffic in utter abhorrence—prove beyond the poſſibility of doubt, that ſlavery of the worſt kind muſt have prevailed among all the negro nations before they were viſited either by the Portugueſe or by the Arabs (1). Theſe two nations may

‡ *Dalzel's Hiſtory of the Kingdom of Dahomy.*

(1) The ſame thing appears from the voyages of M. Saugnier, who had an opportunity of converſing with many tribes of negroes, and who always ſpeaks of ſlavery as an eſtabliſhed practice among them; adding, that ſuch as are ſold for crimes are put to death by their own countrymen if they fly from their maſter. It appears likewiſe in a ſtill more ſtriking light from Dalzel's Hiſtory of Dahomy, where we are told that all the Dahomans,

Slavery.

may indeed have been the firſt who dragged the unhappy negro from his native continent, and made his ſlavery doubly ſevere, by compelling him to labour, without his own conſent, for maſters whom he hardly conſidered as human beings.

On the beginning of this commerce, or the dreadful cruelty with which it has been carried on to the preſent day, it is impoſſible to reflect without horror: but there is ſome conſolation, however ſmall, in knowing that its original authors were not Europeans. The purchaſe of Guinea blacks for ſlaves by foreign nations commenced ages before the Portugueſe had laid that country open to the intercourſe of Europe. Even after they had made many incurſions into it, the inhabitants were as regularly purchaſed for ſlaves by ſome of the adjoining ſtates as they are now by the maritime Europeans.

21 The route by which the Arabs carried on the ſlave-trade. *Whitaker's Review*, p. 185.

"The Arabs of Egypt having reduced all the north of Africa, and carrying with them their love of black ſervants, would be ſure to open a ready communication for themſelves to their country. They certainly had one ſo early as 1512, and before the Europeans had any for that purpoſe (K). They went from Barbary by a route that was ſo much practiſed, as to be denominated expreſly 'the way of the camels.' Meeting together at the town of Cape Cantin, or that of Valadie near it, the commercial caravan traverſed the vaſt deſerts, thoſe of Sarra, which run like the tropic of Cancer over them in a long line acroſs the country; to a place of great population called Hoden, the *Waden* or *Hoden* of our maps, and a little to the ſouth-weſt of Cape Blanco. From Hoden they turned to the left, and puſhed directly into the interior of the continent, to reach Tegazza, the *Tagazel* or *Tagaza* of our maps, and lying nearly eaſt of Hoden. Here aſſuredly they did, as the caravan does certainly at this day; and added to the other wares upon their camels a quantity of ſalt from thoſe mines of rock-ſalt, which are extraordinary enough to be noticed as rocks in our maps. This they carried, as they ſtill carry it, to Tanbut, the *Tombut* of the maps, and a town in the heart of the African continent. And from this town they turned on the right for the ſea coaſt again, and reached it in the great kingdom of Mele, the *Melli* of our maps, to the ſouth of the Gambia, and juſt at the ſpringing as it were of that grand arch of ſea which curves ſo deeply into the body of the land, and conſtitutes the extenſive gulf of Guinea. At Melli and at Tombut they received a meaſure of gold for a meaſure of ſalt. The caravan collects gold at Tombut to the preſent time; but at Melli they purchaſed gold, and alſo ſilver, in pieces as large as pebbles. And at Hoden they had *a great mart for ſlaves*; the blacks being brought thither from the countries adjoining, and bartered away to the traders. Such was the Slave Coaſt and the Gold Coaſt of former days. The ſtaple commodity of Hoden is only transferred now to Whidah; and diverted from the Arabs of Barbary to the Chriſtians of Europe," by whom the negroes are carried to the continent of America or to the Sugar Iſlands in the Weſt Indies. In theſe countries they are all ſold like beaſts in a market; but they experience very different degrees of ſervitude from the different maſters who hold them as property. Such of them as are reconciled to the appearance of white men, or have been born in the European colonies, feel themſelves as happy under a humane maſter as they could be in their native continent (L); and we believe that few of them in ſuch circumſtances have expreſſed a deſire to return."

22 which is now transferred to the Europeans.

23 Condition of ſlaves in the French Weſt Indies under the old government.

In the French Weſt India iſlands, before the late revolution in the mother country, which has produced in all its dependencies anarchy and maſſacre, the condition of the negro ſlaves was better than that of the bondmen among the ancient Germans. "Thoſe of them who cultivated the plantations were attached to the ſoil, and could not be drawn off to pay debts, or be ſold ſeparately from the eſtate on which they lived. This gave them a laſting property in their huts and little ſpots of ground, which they might ſafely cultivate without dread of being turned out of poſſeſſion, or transferred contrary to their intereſt and feelings from one proprietor to another. They were under the protection of law as ſoon as they arrived in the colony. Proper miſſionaries were appointed for the purpoſe of training them up to a certain degree of religious knowledge, and ample funds were allotted for the maintenance of thoſe eccleſiaſtics. On ill treatment received from his maſter, or on being deprived of his allowance of food and raiment, the ſlave was directed to apply to the king's attorney,

mans, from the loweſt to the higheſt, acknowledge the right of the ſovereign to diſpoſe of their perſons and properties at pleaſure; and where we learn, that the ſovereign himſelf aſſured Mr Abſon the Engliſh governor at Whidah, that all his anceſtors had from time immemorial put to death every priſoner of war whom they could not ſell as a ſlave.

(K) In the year 1442, Anthony Gonſalez, a Portugueſe adventurer, reſtored to their native country ſome Mooriſh priſoners whom he had two years before forcibly carried off from the coaſt of Africa. He landed them at *Rio del-Oro*, and received from the Moors in exchange ten blacks and a quantity of gold duſt. This tranſaction proves, that a commerce in black ſervants was then regularly carried on by the Moors and not by the Portugueſe. So early as the year 1502, the Spaniards began to employ a few negroes in the mines of Hiſpaniola; but in the year following, Ovando, the governor of that iſland, forbade the further importation of them, alleging that they taught the Indians all manner of wickedneſs, and rendered them leſs tractable than formerly: and it was not till the year 1517 that the ſupply of negroes to the Spaniſh American plantations became an eſtabliſhed and regular branch of commerce. *Edwards's History of the Weſt Indies*, Book IV. chap. ii.

(L) "I have obſerved many of my ſlaves go on board the veſſel with joy, on my aſſurance that they would be well treated and happy on the plantation where I was going to ſend them. When the Banbarans find that they are truſted by the whites, they never think of making their eſcape, chooſing to be the ſlaves of *Europeans* rather than of a *black man* who would treat them with the greateſt cruelty. *Voyages to the Coaſt of Africa by Meſſrs Saugnier and Briſſon*, p. 332. 335. Engliſh Tranſlation.

Slavery. torney, who was obliged to prosecute the master forthwith. That officer was also bound to prosecute, if by any other means he heard of the abuse; the law adding as the reason, *This we will to be observed, to check the abuse of power in the master* *."

* Ramsay's Essay on the Treatment and Conversion of Slaves, Sect. v.

24
In the British islands.

We wish it were in our power to say, that in the British West India colonies slaves are equally protected by law as they were in the French islands under the old government, and that the same care is taken of their moral and religious improvement. This, however, we are afraid, cannot be said with truth. In the island of Jamaica, before the passing of the *consolidated slave act*, not many years ago, a white man, whether proprietor or not, who had killed a negro, or by an act of severity been the cause of his death, was, for the first offence, intitled to benefit of clergy, and not liable to capital punishment till a repetition of the crime. By the present law, it is enacted, "That if any person, whether owner or superintendant of slaves, shall be convicted of having, by any act of passion or cruelty, occasioned the death of any negro, it shall be capital for the *first* offence: and for the greater security of the property, and as a check on those who may have the punishment of slaves in their power, it is particularly required, that every surgeon or doctor belonging to each estate shall swear to the cause of the death of each negro, to the best of his knowledge and belief; and if any negro dies, and is interred by the owner or overseer, without the doctor's having seen or been sent for to such negro, in this case the owner or overseer causing the negro to be so interred is liable to a prosecution for such conduct."

M'Neil's Observations on the Treatment of Negroes in the island of Jamaica.

This law must doubtless be productive of good effects, but being a colonial act, it cannot have the vigour of the *Code Noir;* nor do we know of any attorney in the island who is *obliged* to defend the rights of the negroes, or prosecute the master whose cruelty has by any means come to his knowledge. The justices and vestry of each parish are indeed constituted *a council of protection*, for the express purpose of making full enquiry into the barbarities exercised on slaves, and bringing the authors to punishment at the public expence; and by a new slave-act of Grenada, the justices are required annually to nominate three freeholders to be *guardians of the slaves*, who are to take an oath to see the law duly executed †. These are benevolent regulations; but we doubt if protection can be so promptly afforded by a council of guardians as by an individual attorney who has no other employment. In some of the other British islands, we have been confidently told that the unfortunate sons of Africa have no protection whatever against the tyranny of a sordid owner, or the caprice of a boyish overseer (M); though it is added, that the humanity of many masters more than supplies the want of laws in every respect but that of improvement, and that the attachment of others has in them a like effect. In some cases good sense, a regard for their reputation, and a well-informed conviction of their interest, induce men to treat their slaves with discretion and humanity. The slaves of many a planter possess advantages beyond what the labourer even of Britain enjoys ‡;" yet these advantages all depend upon the good will of his master; and in no part of the British colonies are the slaves attached to the soil. This single circumstance, together with the total neglect of their moral and religious culture, makes their situation much less eligible than was that of the French slaves under the old government; and affords a striking proof of what the humane author whom we have just quoted well observes, that "those men and nations whom liberty hath exalted, and who therefore ought to regard it tenderly in others, are constantly for restraining its blessings within their own little circle, and delight more in augmenting the train of their dependants than in adding to the rank of fellow-citizens, or in diffusing the benefits of freedom among their neighbours."

† Edwards's Hist. of the West Indes, book iv. chap. v.

‡ Ramsay's Essays, p. 66. and 91.

25
The lawfulness of slavery inquired into.

Having given this ample detail of the rise and progress of slavery in the world, and shown that it has prevailed in every age, and under all religions, we shall now proceed to enquire whether a practice so general be in any instance lawful; and if it be, how it must be modified, in order to be rendered consistent with the rights of man and the immutable laws of virtue.

That in a state of nature one man has a right to seize upon another, and to compel him by force to labour for his subsistence, is a position which we believe has never been seriously maintained. But independent communities stand to each other in the very same relation that individuals do in a state of nature; and therefore if in such a state the man of greater bodily strength or mental sagacity would have no right to convert his weaker neighbour into personal property, neither can the more powerful and enlightened nation have a right to carry off by force, or entice by fraud, the subjects of a weaker and more barbarous community for the purpose of reducing them to a state of servitude. This is a truth so obvious as to admit neither of proof nor of denial.

In thus stating the case between two independent nations, we have in our eye that traffic in slaves which is carried on between the civilized Europeans and the barbarous Africans: and the utmost length which we think an apologist for that trade can go is to contend, that we may lawfully purchase slaves in those countries where from time immemorial they have been a common branch of commerce. But the European right to purchase cannot be better than the African right to sell; and we have never yet been informed what gives one African a right to sell another. Such a right cannot be natural, for the reason which we have elsewhere assigned (see RIGHT): neither can it be adventitious; for adventitious rights are immediately derived from the municipal law, which is the public will of the state. But the state has no authority to deprive an innocent man of his personal freedom, or of the produce of his own labour; for it is only to secure these, by protecting the weak

26
The common apology for it insufficient.

(M) In Barbadoes there is said to be a law for the protection of slaves, which is the most insolent trifling with justice and humanity that the writer of this article has ever seen. It is enacted, forsooth, "That if any man shall, of *wantonness*, or only of *bloody-mindedness*, or *cruel intention*, *wilfully kill* a negro or other slave, if his own, he shall pay into the public treasury *fifteen pounds sterling!* See *Dickson's Letters on Slavery*, p. 4.

weak from the violence of the strong, that states are formed, and individuals united under civil government.

It may perhaps be said, that by patiently submitting to governments which authorize the traffic in human flesh, men virtually give up their personal liberty, and vest their governors with a right to sell them as slaves: but no man can vest another with a right which he possesses not himself; and we shall not hesitate to affirm, that in a state of nature where all have equal rights, no individual can submit himself to the absolute disposal of another without being guilty of the greatest crime. The reason is obvious. From the relation in which men stand to one another as fellow-creatures, and to God as their common Creator, there are duties incumbent upon each peculiar to himself; in the performance of which he can be guided only by his own reason, which was given him for that very purpose. But he who renounces his personal freedom, and submits unconditionally to the caprice of a master, impiously attempts to set himself free from the obligation of that law which is interwoven with his very being, and chooses a director of his conduct different from that which God has assigned him. A man therefore cannot put himself in a state of unconditional servitude; and what he cannot do for himself, he surely cannot authorize others to do for him either by a tacit or by an open consent.

27
No man has a right to give himself up to the absolute disposal of another.

These considerations have often made us regret that writers, for whose talents and integrity we have the highest respect, should, without accurately defining what they mean by slavery, have peremptorily affirmed, that, consistently with the law of nature men may be reduced to that state as a punishment for crimes, or to discharge debts which they cannot otherwise pay. That a criminal, who has forfeited his life to the laws of his country, may have his punishment commuted for hard labour, till death in the course of nature shall put a period to his terrestrial existence, is a truth which we apprehend cannot be controverted; but to make such a commutation of punishments consistent with the laws of nature and of nature's God, it appears to us that the kind and degree of labour must be precisely ascertained, and the conduct of the criminal not left to the capricious direction of any individual.

28
What kind of slavery may be employed as a punishment.

Punishments can be justly inflicted only for one or other of two ends, or for both. They may be calculated either to reform the criminal or to be a warning to the innocent; and those which most effectually answer both these purposes are surely to be preferred to such as answer but one of them. For this reason we consider hard labour as a much fitter punishment for most crimes than death: but to entitle it to preference, the kind and degree of the labour must be ascertained by the law; for if these circumstances be omitted, and the offender delivered over as a slave to the absolute disposal and caprice of a private master, the labour to which he is condemned, instead of operating to his reformation, may be converted into the means of tempting him to the commission of new crimes. A young woman, in the state of servitude, would hardly be able to maintain her virtue against the solicitations of a master who should promise her liberty or a remission of toil upon her yielding to his desires; and the felon, who had long been accustomed to a life of vagrancy and idleness, would not strenuously object to the perpetration of any wickedness to obtain his freedom, or even a diminution of his daily task. Indeed such temptations might be thrown in his way, as human nature could not resist but by means of much better principles than felons can be supposed to possess. He might be scourged into compliance; or his labour might be so increased as to make him for a little respite eagerly embrace the most nefarious proposal which his master could make: for being absolute property, there is no earthly tribunal to which he could appeal for justice; and felons do not commonly support themselves under trials by pious meditations on a future state.

By reasoning in this way, we are far from meaning to insinuate that slave-holders in general torture their slaves into the commission of crimes. God forbid! Many of them we know to be religious, humane, and benevolent: but they are not infallible; and some of them may be instigated, some of them undoubtedly have been instigated, by avarice and other worse principles, to compel creatures, who are so absolutely their dependents, to execute deeds of darkness too hazardous for themselves. But the morality or immorality of any action, and the moral fitness of any state, are to be judged of by their natural tendency, if the one were universally practised and the other universally prevalent (see Moral Philosophy, N° 156.): and as the natural tendency of absolute domestic slavery among such creatures as men is to throw the most powerful temptations to vice in the way both of master and of slave, it must be in every instance, even when employed as a punishment, inconsistent with the fundamental principles of moral virtue.

Some writers indeed have maintained, and the civil law seems to suppose, that children are the property of their parents, and may by them be sold as slaves in cases of urgent necessity: but if we duly consider how property is acquired (see Property), and attend to the natural consequences of slavery, we shall soon be convinced that this opinion is very ill founded. The rights of parents result from their duties; and it is certainly the duty of that man who has been the instrument of bringing into the world an intellectual and moral being, to do every thing in his power to render the existence of that being happy both in the present life and in that which is to come. If this duty be conscientiously discharged, the parent has a manifest right to the gratitude, love, and reasonable obedience, of his child; but he cannot, in consequence of any duty performed, claim a right to transfer that child as property to the uncontrolled disposal of any private master; for this plain reason, that the man who is considered as the private property of another, cannot reasonably be supposed to enjoy happiness in this world, and is under many temptations to do what must necessarily render him miserable in the next. See Moral Philosophy, N° 138.

29
Children not the property of their parents.

If criminals cannot be lawfully reduced to a state of absolute private slavery, much less surely can it be lawful to reduce insolvent debtors and prisoners of war to that state. Many a virtuous man, who has contracted debts with the fairest prospect of paying them, has been suddenly rendered insolvent by fire, by shipwreck, or by the bankruptcy of others with whom he was necessarily engaged in the course of his trade. Such a man can be considered in no respect as criminal. He has been indeed unfortunate; but it would be grossly unjust, as well

well as ſhockingly cruel, to add to his misfortune by reducing him to a ſtate to which we have juſt ſeen that the vileſt felon cannot be reduced without a violation of the laws of morality. Fraudulent bankrupts indeed, of whom we daily ſee many, might with great propriety and the ſtricteſt juſtice be compelled to extenuate their debts by labouring for the benefit of thoſe whom they have injured; and criminals of other deſcriptions might be made to work for the benefit of the public: but in both caſes the taſk to be performed ſhould be aſcertained by the law, and the perſons of the labourers be protected by the ſtate. If ſuch can be called ſlaves, their ſlavery is undoubtedly conſiſtent with every principle of virtue and religion; for they ſuffer nothing but the due reward of their deeds. Priſoners of war, however, can upon no honeſt principle be reduced even to this ſtate of mitigated bondage; for they are ſo far from incurring guilt by fighting for their country, that even to their enemies their courage and conduct in ſuch a cauſe muſt appear worthy of reward. A victorious general has certainly a right to prevent the priſoners taken in battle from again drawing their ſwords againſt him during the continuance of the war; but there are many ways by which this may be done effectually without chaining the unfortunate captives to the oar, or ſelling them like cattle to private purchaſers, by whom they may be treated with capricious cruelty, and driven to the perpetration of the greateſt crimes.

30
Fraudulent bankrupts may be compelled to labour for the benefit of their creditors.

31
Two objections to our concluſions.

To theſe concluſions, and the reaſoning on which they are built, we are aware it may be objected, that if private ſlavery were in every inſtance unlawful and inconſiſtent with the fundamental principles of morality, it would not have prevailed among the ancient patriarchs, and far leſs have been authoriſed by the Jewiſh law.

32
The former anſwered.

In reply to this objection, it may be obſerved, that Abraham, Iſaac, and Jacob, though excellent men, were not characters abſolutely perfect; that as their practice does not authoriſe polygamy or inceſt among us, it will not authoriſe the reducing of our fellow-creatures to a ſtate of hopeleſs ſervitude; and that from the circumſtances of the age in which they lived, many things were permitted to them, and were indeed harmleſs, which are forbidden to us, and would now be pernicious. The character of Abraham appears to have been much more perfect than that of his ſon or grandſon; and was certainly equal, if not ſuperior, to that of any other mere man of whom we read either in profane or even in ſacred hiſtory. We are to remember, however, that he was born amidſt idolaters, and was probably an idolater himſelf till enlightened by the inſpiration of Jehovah, and called from his kindred and from his father's houſe. Before his converſion, he muſt have had much cattle and many ſlaves, which conſtituted the riches of that early period; and his caſe would indeed have been peculiarly hard, had he been commanded to diveſt himſelf of his ſervants, and to depart into a ſtrange country very thinly inhabited, without people to protect his flocks and herds from beaſts of prey. Nor would his loſs have contributed in any degree to the benefit of his ſlaves, who, as the ranks of men were then adjuſted, could not long have preſerved their liberty. Had they not been forcibly reduced to their former ſtate by their idolatrous countrymen, which in all probability they would have been, they muſt have ſoon ſubmitted to it, or periſhed by hunger. Let it be remembered, too, that the bond-ſervants of Abraham, though conſtituting the moſt valuable part of his property, were not conſidered as a ſpecies of inferior beings, but were treated rather as children than as ſlaves. This is evident from his ſpeaking of the ſteward of his houſe as his heir, when complaining to God of the want of ſeed. Indeed the manner in which this circumſtance is mentioned, ſhows that it was then the general practice to conſider domeſtic ſlaves as members of the family; for the patriarch does not ſay, "I will leave my ſubſtance to this Eliezer of Damaſcus;" but his words are, "Behold to me thou haſt given no ſeed; and lo, one born in my houſe is *my heir* *." From this mode of expreſſion we are ſtrongly inclined to think that captives taken in war were in that age of ſimplicity incorporated into the family or tribe of the conqueror, as they are ſaid to be at preſent among the North American Indians, to ſupply the place of thoſe who had fallen in battle. If ſo, ſlavery was then a very mild thing, unattended with the evils which are now in its train, and muſt often have been highly beneficial to the captive.

* Gen. xv. 3.

33
Anſwer to the other.

The other part of the objection appears at firſt ſight more formidable: but perhaps a little attention to the deſign of the Moſaic economy may enable us to remove it even more completely than this. We need not inform our theological readers, that one great purpoſe for which the poſterity of Abraham were ſeparated from the heathen nations around them, was to preſerve the knowledge of the true God in a world run headlong into idolatry. As idolatry appears to have had ſomething in its forms of worſhip extremely captivating to rude minds, and as the minds of the Iſraelites at the era of their departure from Egypt were exceedingly rude, every method was taken to keep their ſeparation from their idolatrous neighbours as complete as poſſible. With this view they were commanded to ſacrifice the animals which their Egyptian maſters had worſhipped as gods, and were taught to conſider hogs and ſuch other creatures as the heathen offered in ſacrifice, when celebrating their myſtical and magic rites, as too unclean to be eaten or even to be touched. Of this diſtinction between clean and unclean beaſts, God himſelf aſſigns the reaſon: "I am the Lord your God (ſays he), who have ſeparated you from other people; ye ſhall therefore put difference between clean and unclean beaſts, and between unclean fowls and clean †." For the ſame reaſon they were prohibited from intermarrying with the heathen, or having any tranſaction whatever with them as neighbours; and the ſeven idolatrous nations of Canaan they were ſtrictly commanded to exterminate. "When the Lord thy God (ſays Moſes) ſhall deliver them before thee, thou ſhalt ſmite them, and utterly deſtroy them: thou ſhalt make no covenant with them, nor ſhow mercy unto them: neither ſhalt thou make marriages with them: thy daughter thou ſhalt not give unto his ſon, nor his daughter ſhalt thou take to thy ſon; for they will turn away thy ſon from following me, that they may ſerve other gods ‡."

† Lev. xx. 24, 25, 26.

‡ Deut. vii. 2, 3, 4.

Under theſe laws, it is plain that no intercourſe whatever could have place between an Iſraelite and a man of any other nation, unleſs the latter was reduced to ſuch a ſtate as that he could neither tempt the former, nor practiſe himſelf the rites of his idolatrous worſhip.

Slavery, Slave-trade.

But the Iſraelites were not ſeparated from the reſt of the world for their own ſakes only: They were intended to be the repoſitaries of the lively oracles of God, and gradually ſpread the light of divine truth through other nations, till the fulneſs of time ſhould come, when in Chriſt all things were to be gathered together in one. To anſwer this end, it was neceſſary that there ſhould be ſome intercourſe between them and their Gentile neighbours; but we have ſeen that ſuch an intercourſe could only be that which ſubſiſts between maſters and their ſlaves.

Should this apology for the ſlavery which was authoriſed by the Jewiſh law be deemed fanciful, we beg leave to ſubmit to the conſideration of our readers the following account of that matter, to which the ſame objection will hardly be made. It was morally impoſſible that between nations differing ſo widely in religion, cuſtoms, and manners, as the Jews and Gentiles, peace ſhould for ever reign without interruption; but when wars broke out, battles would be fought, and priſoners would be taken. How were theſe priſoners to be diſpoſed of? Cartels for exchange were not then known: it was the duty of the Iſraelites to prevent their captives from taking up arms a ſecond time againſt them; they could not eſtabliſh them among themſelves either as artificers or as huſbandmen; for their law enjoined them to have no communication with the heathen. There was therefore no other alternative but either to maſſacre them in cold blood, or to reduce them to the condition of ſlaves. It would appear, however, that thoſe ſlaves were raiſed to the rank of citizens, or at leaſt that their burdens were much lightened, as ſoon as they were convinced of the truth of the Moſaic revelation, and received into covenant with God by the rite of circumciſion. They were then admitted to the celebration of the paſſover; concerning which one law was decreed to the ſtranger, and to him that was home-born. Indeed, when we conſider who was the legiſlator of the Jews; when we reflect upon the number of laws enacted to mitigate ſlavery among them, and call to mind the means by which the due execution of all their laws was enforced, (ſee THEOLOGY), we cannot help being of opinion that the heathen, who was reduced to ſlavery in Judea, might be happier, if he pleaſed, than when living as a freeman in his own country. But whether this be ſo or not, is a matter with which we have no concern. On account of the hardneſs of their hearts, and the peculiarity of their circumſtances, many things, of which ſlavery may have been one, were permitted to the Jews, which, if practiſed by Chriſtians, would render them highly guilty.

After treating thus largely of ſlavery in general, we need not occupy much of the reader's time with the

34 Slave-trade.

SLAVE-TRADE carried on by the merchants of Europe with the natives of Africa. It is well known that the Portugueſe were the firſt Europeans who embarked in this trade, and that their example was ſoon followed by the Dutch and the Engliſh. Of the riſe and progreſs of the Engliſh commerce in ſlaves, the reader will find a ſufficient account in other articles of this work †. That commerce, though long cheriſhed by the government as a ſource of national and colonial wealth, was from its commencement conſidered by the thinking part of the nation as a traffic inconſiſtent with the rights of man, and ſuſpected to be carried on by acts of violence. Theſe ſuſpicions were gradually ſpread through the people at large, and confirmed, in many inſtances, by evidence incontrovertible. Laws were in conſequence enacted to make the negroes more comfortable on what is called the middle paſſage, and to protect them againſt the wanton cruelty of their maſters in the Weſt Indies: but the humanity of the nation was rouſed; and not many years ago a number of gentlemen of the moſt reſpectable characters, finding that no adequate protection could be afforded to perſons in a ſtate of hopeleſs ſervitude, formed themſelves into a ſociety at London, for the purpoſe of procuring a total abolition of the ſlave-trade. That the motives which influenced the leading men of this ſociety were of the pureſt kind, cannot, we think, be queſtioned; for their object was to deliver thoſe who had none to help them, and from whom they could expect no other reward for their labours of love than the bleſſings of them who were ready to periſh. To a cauſe truly Chriſtian, who did not pray for ſucceſs? or who but muſt have felt the moſt pungent regret, if that ſucceſs had been rendered doubtful, or even delayed, by the imprudence of ſome of the agents employed by the ſociety? This we apprehend was really the caſe. Language calculated only to exaſperate the planters could not ſerve the negroes; and the legiſlature of Great Britain would never ſuffer itſelf to be forced into any meaſure by the menaces of individuals.

† See *Company*, and *Guinea*.

35 Petitions for the abolition of it.

In the year 1793, petitions were preſented to parliament for the abolition of this inhuman traffic, which gave a pleaſing picture of the philanthropy of the nation; but, unfortunately for the cauſe of freedom, it was diſcovered that many of the names ſubjoined to thoſe petitions had been collected by means not the moſt honourable. The diſcovery, perhaps, would never have been made, had not the inſulting epithets indiſcriminately heaped upon the ſlave-holders provoked thoſe men to watch with circumſpection over the conduct of their opponents. The conſequence was, that ſuſpicions of unfair dealing on the part of the petitioners were excited in the breaſts of many who, though they ardently wiſhed well to the cauſe, choſe not to add their names to thoſe of ſchool-boys under age, and of peaſants who knew not what they were ſubſcribing. Let the rights of the Africans be maintained with ardour and firmneſs; but never let their advocates ſuppoſe that the cauſe of humanity requires the ſupport of artifice. Abſolute ſlavery, in which the actions of one man are regulated by the caprice of another, is a ſtate demonſtrably inconſiſtent with the obvious plan of the moral government of the world. It degrades the mental faculties of the ſlave, and throws, both in his way and in his maſter's, temptations to vice almoſt inſurmountable. Let theſe truths be ſet in a proper light by thoſe who have doubtleſs ſeen them exemplified; and they will ſurely have their full effect on the minds of a generous, and, we truſt, not an impious people (N). The trade will be generally aboliſhed; pains will be taken

(N) We have not inſiſted upon the impolicy of the ſlave-trade, or endeavoured to prove that its abolition would

Slave-trade.

ken to cultivate the minds of the West Indian negroes; and the era may be at no great distance when slavery shall cease through all the British dominions.

36 Objection to the abolition

But what benefit, it will be asked, will the negroes of Africa reap from an abolition of the slave trade? Should any thing so wildly incredible happen, as that all the nations of Christendom, in one common paroxysm of philanthropy, should abandon this commerce in servants, which has been prosecuted in all ages, and under all religions; they would only abandon it to those who were originally possessed of it, who still penetrate into the country, and who even push up to Gago at the very head of the Slave coast; and leave the wool-headed natives of it to Mahometan masters, in preference to Christian. Under such masters they were in Judea at the time of the crusades. Under such, as we learn from Messrs Saugnier, Brisson, and others, they still are in the deserts of Africa, as well as in the islands of Johanna and Madagascar *; and it is universally known that they enslave one another as a punishment for the most whimsical crimes. Among them, indeed, slavery seems to be reduced to a system, and to descend, as it has done in more polished nations, from father to son; for both Saugnier and Wadstrom † speak of particular families of negroes who are exempted from that degrading state by the laws of the country.

* *Asiatic Researches*, vol. ii.

† *Essay on Colonization.*

All this we admit to be true. Most certainly the negroes would not be exempted from the miseries of servitude, though Europe and the West Indies were swallowed up in the ocean. The *customs* of the country, as the king of Dahomy assured Mr Abson ‡, will be *made* as long as black men shall continue to possess their own territories, in their present state of depravity and ignorance; and these customs appear to involve slavery of the cruellest kind. But if slavery be in itself unlawful, is it a sufficient excuse for our continuing the traffic that it is carried on by the rude negroes and the savage Arabs? Are people, whom we sometimes affect to consider as an inferior order of beings, to furnish examples of conduct to those who boast of their advancements in science, in literature, and in refinement? Or will the benevolent Lord of all things pardon us for oppressing our helpless brethren, merely because they are cruelly oppressed by others? It is indeed true that the natives of Guinea cannot be made really free but by introducing among them the blessings of religion and the arts of civil life; but surely they would have fewer temptations than at present to kidnap one another, or to commence unprovoked wars for the purpose of making captives, were the nations of Europe to abandon the commerce in slaves (o). That commerce, we grant, would be continued by the Arabs, and perhaps by others of the eastern nations; but the same number of people could not be carried off by them alone that is now carried off both by them and by the Europeans.

‡ *Dalzel's History.*

37 of no strength.

Were it indeed possible to put the slave-trade under proper regulations, so as to prevent all kidnapping and unjust wars among the Africans, to supply the markets; and were it likewise possible to ensure to the negroes in the West Indies mild treatment and religious instruction; we are far from being sure that while the natives of Guinea continue so rude, and their neighbours the Arabs so selfishly savage, it would be proper to abandon at once to hordes of barbarians the whole of this commerce in bond servants. "The trade, which in its present form is a reproach to Britain, might be made to take a new shape, and become ultimately a blessing to thousands of wretches who, left in their native country, would have dragged out a life of miserable ignorance, unknowing the hand that framed them, unconscious of the reason of which they were made capable, and heedless of the happiness laid up for them in store §.

§ *Ramsay's Essay*, p. 292, &c.

Slavery is, indeed, in every form an evil; but it seems to be one of those many evils which, having long prevailed in the world, can be advantageously removed only by degrees, and as the moral cultivation of the slaves may enable them to support the rank and discharge the duties of free men. This is doubtless the reason why it was not expressly prohibited by the divine Author of our religion, but suffered to vanish gradually before the mild influence of his Heavenly doctrines. It has vanished before these doctrines in most countries of Europe; and it affords us no small gratification to have it in our power to record, what indeed must be fresh in the memory of our readers, that the abolition of the slave-trade was finally accomplished by the steady perseverance and generous exertions of some of the most enlightened and respectable characters in the kingdom, who, after a long and arduous struggle, obtained a decree of the legislature, prohibiting, after a limited period, the trade in slaves to be continued by subjects of Britain. The bill originated in the house of lords, and having undergone considerable discussion in the house of commons, finally passed on the 16th of March, and received his majesty's assent

38 Abolition of the slave-trade in Britain.

would be *advantageous* to the sugar-planters; for the planters surely understand their own interest better than those can do, who, having never been in the West Indies, are obliged to content themselves with what information they can glean on the subject from a number of violent and contradictory publications. To countenance slavery under any form is undoubtedly immoral. This we know: and therefore upon this ground have we opposed the slave-trade, which cannot be continued without preferring interest to virtue.

(o) In a speech which Mr Dalzel says the king of Dahomy made to Mr Abson, when he was informed of what had passed in England on the subject of the slave-trade, are these remarkable words: "In the name of my ancestors and myself, I aver that no Dahoman ever embarked in war merely for the sake of procuring wherewithal to purchase your commodities." We must take the liberty to question the truth of this solemn averment. That the slave-trade is not the *sole* cause of the Dahoman wars every man will admit, who does not fancy that those people have neither passions nor appetites, but for the commodities of Europe: but the bare affirmation of this bloody despot, who boasted of having killed many thousands at the *customs*, will not convince those who have read either Wadstrom's Essay on Colonization, or the evidence respecting the slave-trade given at the bar of the House of Commons, "that no Dahoman *ever* embarked in war merely to procure slaves to barter for European commodities."

Slave-trade ‖ Sleep-walker.

assent on the 25th March 1807. The time fixed by the bill, for the total abolition of the trade, we believe, was the beginning of the following year, viz. January 1808.

We cannot conclude without expressing a hope, that the period is not very distant when the slaves in the West Indies shall be so much improved in moral and religious knowledge, as that they may be safely trusted with their own freedom. To set them free in their present state of ignorance and depravity, is one of the wildest proposals that the ardour of innovation has ever made. Such freedom would be equally ruinous to themselves and to their masters; and we may say of it what Cicero said of some unseasonable indulgences proposed to be granted to the slaves in Sicily: *Quæ cum accidunt, nemo est, quin intelligat ruere illam rempublicam; hæc ubi veniunt, nemo est, qui ullam spem salutis reliquam esse arbitretur.*

39 Danger of a sudden manumission of slaves.

Those of our readers who wish to enter into a detail of this subject, may consult, with much advantage, The History of the Rise, Progress, and Accomplishment of the Abolition of the African Slave-Trade, by Mr Clarkson, 2 vols 8vo.

SLAUGHTER. See MANSLAUGHTER, HOMICIDE, MURDER, &c.

SLEDGE, a kind of carriage, without wheels, for the conveyance of very weighty things, as huge stones, bells, &c. The sledge for carrying criminals, condemned for high treason, to execution, is called HURDLE. The Dutch have a kind of sledge on which they can carry a vessel of any burden by land. It consists of a plank of the length of the keel of a moderate ship, raised a little behind, and hollow in the middle; so that the sides go a little aslope, and are furnished with holes to receive pins, &c. The rest is quite even.

SLEDGE is a large smith's hammer, to be used with both hands: of this there are two sorts, the up-hand sledge, which is used by under workmen, when the work is not of the largest sort; it is used with both the hands before, and they seldom raise it higher than their head. But the other, which is called the about-sledge, and which is used for battering or drawing out the largest work, is held by the handle with both hands, and swung round over their heads, at their arm's end, to strike as hard a blow as they can.

SLEEP, that state of the body in which, though the vital functions continue, the senses are not affected by the ordinary impressions of external objects. See DREAMS and PHYSIOLOGY.

SLEEP-Walker, one who walks in his sleep. Many instances might be related of persons who were addicted to this practice; but it will be sufficient to select one remarkable instance from a report made to the Physical Society of Lausanne, by a committee of gentlemen appointed to examine a young man who was accustomed to walk in his sleep.

"The disposition to sleep-walking seems, in the opinion of this committee, to depend on a particular affection of the nerves, which both seizes and quits the patient during sleep. Under the influence of this affection, the imagination represents to him the objects that struck him while awake, with as much force as if they really affected his senses; but does not make him perceive any of those that are actually presented to his senses, except in so far as they are connected with the dreams which engross him at the time. If, during this state, the imagination has no determined purpose, he receives the impression of objects as if he were awake; only, however, when the imagination is excited to bend its attention towards them. The perceptions obtained in this state are very accurate, and, when once received, the imagination renews them occasionally with as much force as if they were again acquired by means of the senses. Lastly, these academicians suppose, that the impressions received during this state of the senses disappear entirely when the person awakes, and do not return till the return of the same disposition in the nervous system.

Sleep-walker.

"Their remarks were made on the Sieur Devaud, a lad thirteen years and a half old, who lives in the town of Vevey, and who is subject to that singular affection or disease called *Somnambulism* or sleep-walking. This lad possesses a strong and robust constitution, but his nervous system appears to be organised with peculiar delicacy, and to discover marks of the greatest sensibility and irritability. His senses of smell, taste, and touch, are exquisite; he is subject to fits of immoderate and involuntary laughter, and he sometimes likewise weeps without any apparent cause.

"This young man does not walk in his sleep every night; several weeks sometimes pass without any appearance of a fit. He is subject to the disease generally two nights successively, one fit lasting for several hours. The longest are from three to four hours, and they commonly begin about three or four o'clock in the morning.

"The fit may be prolonged, by gently passing the finger or a feather over his upper lip, and this slight irritation likewise accelerates it. Having once fallen asleep upon a staircase, his upper lip was thus irritated with a feather, when he immediately ran down the steps with great precipitation, and resumed all his accustomed activity. This experiment was repeated several times.

"The young Devaud thinks he has observed, that, on the evenings previous to a fit, he is sensible of a certain heaviness in his head, but especially of a great weight in his eyelids.

"His sleep is at all times unquiet, but particularly when the fits are about to seize him. During his sleep, motions are observable in every part of his body, with starting and palpitations; he utters broken words, sometimes sits up in his bed, and afterwards lies down again. He then begins to pronounce words more distinctly, he rises abruptly, and acts as he is instigated by the dream that then possesses him. He is sometimes in sleep subject to continued and involuntary motions.

"The departure of the fit is always preceded by two or three minutes of calm sleep, during which he snores. He then awakes rubbing his eyes like a person who has slept quietly.

"It is dangerous to awaken him during the fit, especially if it is done suddenly; for then he sometimes falls into convulsions. Having risen one night with the intention of going to eat grapes, he left the house, passed through the town, and went to a vineyard where he expected good cheer. He was followed by several persons, who kept at some distance from him, one of whom fired a pistol, the noise of which instantly awakened him, and he fell down without sense. He was carried home and brought to himself, when he recollected very well the

having

having been awakened in the vineyard; but nothing more, except the fright at being found there alone, which had made him ſwoon.

"After the fits he generally feels a degree of laſſitude: ſometimes, though rarely, of indiſpoſition. At the end of one of thoſe fits, of which the gentlemen of the committee were witneſſes, he was affected with vomitings; but he is always ſoon reſtored.

"When he is awaked, he never for the moſt part recollects any of the actions he has been doing during the fit.

"The ſubject of his dreams is circumſcribed in a ſmall circle of objects, that relate to the few ideas with which at his age his mind is furniſhed; ſuch as his leſſons, the church, the bells, and eſpecially tales of ghoſts. It is ſufficient to ſtrike his imagination the evening before a fit with ſome tale, to direct his ſomnambuliſm towards the object of it. There was read to him while in this ſituation the ſtory of a robber; he imagined the very next moment that he ſaw robbers in the room. However, as he is much diſpoſed to dream that he is ſurrounded with them, it cannot be affirmed that this was an effect of the reading. It is obſerved, that when his ſupper has been more plentiful than uſual, his dreams are more diſmal.

"In their report, the gentlemen of the committee dwell much on the ſtate of this young man's ſenſes, on the impreſſion made upon them by ſtrange objects, and on the uſe they are of to him.

"A bit of ſtrong ſmelling wood produced in him a degree of reſtleſſneſs; the fingers had the ſame effect, whether from their ſmell or their tranſpiration. He knew wine in which there was wormwood by the ſmell, and ſaid that it was not wine for his table. Metals make no impreſſion on him.

"Having been preſented with a little common wine while he was in a ſtate of apathy, and all his motions were performed with languor, he drank of it willingly; but the irritation which it occaſioned produced a deal of vivacity in all his words, motions, and actions, and cauſed him to make involuntary grimaces.

"Once he was obſerved dreſſing himſelf in perfect darkneſs. His clothes were on a large table, mixed with thoſe of ſome other perſons; he immediately perceived this, and complained of it much; at laſt a ſmall light was brought, and then he dreſſed himſelf with ſufficient preciſion. If he is teaſed or gently pinched, he is always ſenſible of it, except he is at the time ſtrongly engroſſed with ſome other thing, and wiſhes to ſtrike the offender; however, he never attacks the perſon who has done the ill, but an ideal being whom his imagination preſents to him, and whom he purſues through the chamber without running againſt the furniture, nor can the perſons whom he meets in his way divert him from his purſuit.

"While his imagination was employed on various ſubjects, he heard a clock ſtrike, which repeated at every ſtroke the note of the cuckoo. There are cuckoos here, ſaid he; and, upon being deſired, he imitated the ſong of that bird immediately.

"When he wiſhes to ſee an object, he makes an effort to lift his eyelids; but they are ſo little under his command, that he can hardly raiſe them a line or two, while he draws up his eyebrows; the iris at that time appears fixed, and his eye dim. When any thing is preſented to him, and he is told of it, he always half opens his eyes with a degree of difficulty, and then ſhuts them after he has taken what was offered to him.

"The report infers from theſe facts, and from many others relative to the different ſenſes, that their functions are not ſuſpended as to what the ſleep-walker wiſhes to ſee, that is, as to all thoſe perceptions which accord with the objects about which his imagination is occupied; that he may alſo be diſpoſed to receive thoſe impreſſions, when his imagination has no other object at the time; that in order to ſee, he is obliged to open his eyes as much as he can, but when the impreſſion is once made, it remains; that objects may ſtrike his ſight without ſtriking his imagination, if it is not intereſted in them; and that he is ſometimes informed of the preſence of objects without either ſeeing or touching them.

"Having engaged him to write a theme, ſay the committee, we ſaw him light a candle, take pen, ink, and paper, from the drawer of his table, and begin to write, while his maſter dictated. As he was writing, we put a thick paper before his eyes, notwithſtanding which he continued to write and to form his letters very diſtinctly; ſhowing ſigns, however, that ſomething was incommoding him, which apparently proceeded from the obſtruction which the paper, being held too near his noſe, gave to his reſpiration.

"Upon another occaſion, the young ſomnambuliſt aroſe at five o'clock in the morning, and took the neceſſary materials for writing, with his copy-book. He meant to have begun at the top of a page; but finding it already written on, he came to the blank part of the leaf, and wrote ſome time from the following words, *Fiunt ignari pigritia—Ils deviennent ignorans par la pareſſe;* and, what is remarkable, after ſeveral lines he perceived he had forgot the *s* in the word *ignorans*, and had put erroneouſly a double *r* in *pareſſe;* he then gave over writing, to add the *s* he had forgotten, and to eraſe the ſuperfluous *r*.

"Another time he had made, of his own accord, a piece of writing, in order, as he ſaid, to pleaſe his maſter. It conſiſted of three kinds of writing, text, half text, and ſmall writ; each of them performed with the proper pen. He drew, in the corner of the ſame paper, the figure of a hat; he then aſked for a penknife to take out a blot of ink which he had made between two letters, and he eraſed it without injuring them. Laſtly, he made ſome arithmetical calculations with great accuracy.

"In order to explain ſome of the facts obſerved by the academicians which we have here mentioned, they eſtabliſh two general obſervations, which reſult from what they have ſaid with reſpect to the ſenſes and the dreams of this ſleep-walker.

"1. That he is obliged to open his eyes, in order to recogniſe objects which he wiſhes to ſee; but the impreſſion once made, although rapidly, is vivid enough to ſuperſede the neceſſity of his opening them again, to view the ſame objects anew; that is, the ſame objects are afterwards preſented to his imagination with as much force and preciſion as if he actually ſaw them.

"2. That his imagination, thus warmed, repreſents to him objects, and ſuch as he figures to himſelf, with as much vivacity as if he really ſaw them; and, laſtly, that all his ſenſes, being ſubordinate to his imagination, ſeem feem concentrated in the object with which it is occupied, and have at that time no perception of any thing but what relates to that object.

"Thefe two caufes united feem to them fufficient for explaining one of the moft fingular facts that occurred to their obfervation, to wit, how the young Devaud can write, although he has his eyes fhut, and an obftacle before them. His paper is imprinted on his imagination, and every letter which he means to write is alfo painted there, at the place in which it ought to ftand on the paper, and without being confounded with the other letters; now it is clear that his hand, which is obedient to the will of his imagination, will trace them on the real paper, in the fame order in which they are reprefented on that which is pictured in his head. It is thus that he is able to write feveral letters, feveral fentences, and entire pieces of writing; and what feems to confirm the idea, that the young Devaud writes according to the paper painted on his imagination is, that a certain fleep-walker, who is defcribed in the French *Encyclopédie* (article *Somnambulifm*), having written fomething on a paper, another piece of paper of the fame fize was fubftituted in its ftead, which he took for his own, and made upon this blank paper the corrections he meant to have made on the other which had been taken away, precifely in the places where they would have been.

"It appears from the recital of another fact, that Devaud, intending to write at the top of the firft leaf of a white paper book, *Vevey, le*— ftopped a moment as if to recollect the day of the month, left a blank fpace, and then proceeded to *Decembre* 1787; after which he afked for an almanac: a little book, fuch as is given to children for a new year's gift, was offered to him; he took it, opened it, brought it near his eyes, then threw it down on the table. An almanac which he knew was then prefented to him; this was in German, and of a form fimilar to the almanac of Vevey: he took it, and then faid, 'What is this they have given me; here, there is your German almanac.' At laft they gave him the almanac of Berne; he took this likewife, and went to examine it at the bottom of an alcove that was perfectly dark. He was heard turning over the leaves, and faying 24, then a moment afterwards 34. Returning to his place, with the almanac open at the month of December, he laid it on the table and wrote in the fpace which he had left blank the 24th. This fcene happened on the 23d; but as he imagined it to be the 24th, he did not miftake. The following is the explication given of this fact by the authors of the report.

"The dates 23d, 24th, and 25th, of the month of December, had long occupied the mind of the young Devaud. The 23d and 25th were holidays, which he expected with the impatience natural to perfons of his age, for the arrival of thofe moments when their little daily labours are to be fufpended. The 25th efpecially was the object of his hopes; there was to be an illumination in the church, which had been defcribed to him in a manner that quite tranfported him. The 24th was a day of labour, which came very difagreeably between the two happy days. It may eafily be conceived, how an imagination fo irritable as that of the young Devaud would be ftruck with thofe pleafing epochs. Accordingly, from the beginning of the month he had been perpetually turning over the almanac of Vevey. He calculated the days and the hours that were to elapfe before the arrival of his wifhed-for holidays; he fhowed to his friends and acquaintance the dates of thofe days which he expected with fo much impatience; every time he took up the almanac, it was only to confult the month of December. We now fee why that date prefented itfelf to his mind. He was performing a tafk, becaufe he imagined the day to be the Monday which had fo long engroffed him. It is not furprifing, that it fhould have occurred to his imagination, and that on opening the almanac in the dark he might have thought he faw this date which he was feeking, and that his imagination might have reprefented it to him in as lively a manner as if he had actually feen it. Neither is it furprifing that he fhould have opened the almanac at the month of December; the cuftom of perufing this month muft have made him find it in the dark by a mere mechanical operation. Man never feems to be a machine fo much as in the ftate of fomnambulifm; it is then that habit comes to fupply thofe of the fenfes that cannot be ferviceable, and that it makes the perfon act with as much precifion as if all his fenfes were in the utmoft activity. Thefe circumftances deftroy the idea of there being any thing miraculous in the behaviour of young Devaud with refpect to the date and the month that he was in queft of; and the reader, who has entered into our explanations, will not be furprifed at his knowing the German almanac; the touch alone was fufficient to point it out to him; and the proof of this is the fhortnefs of the time that it remained in his hands.

"An experiment was made by changing the place of the ink-ftandifh during the time that Devaud was writing. He had a light befide him, and had certified himfelf of the place where his ink-holder was ftanding by means of fight. From that time he continued to take ink with precifion, without being obliged to open his eyes again: but the ink ftandifh being removed, he returned as ufual to the place where he thought it was: It muft be obferved, that the motion of his hand was rapid till it reached the height of the ftandifh, and then he moved it flowly, till the pen gently touched the table as he was feeking for the ink: he then perceived that a trick had been put on him, and complained of it; he went in fearch of his ink-ftandifh and put it in its place. This experiment was feveral times repeated, and always attended with the fame circumftances. Does not what we have here ftated prove, that the ftandifh, the paper, the table, &c. are painted on his imagination in as lively a manner as if he really faw them, as he fought the real ftandifh in the place where his imagination told him it ought to have been? Does it not prove that the fame lively imagination is the caufe of the moft fingular actions of this fleep-walker? And laftly, does it not prove, that a mere glance of his eye is fufficient to make his impreffions as lively as durable?

"The committee, upon the whole, recommend to fuch as wifh to repeat the fame experiments, 1. To make their obfervations on different fleep-walkers. 2. To examine often whether they can read books that are unknown to them in perfect darknefs. 3. To obferve whether they can tell the hours on a watch in the dark. 4. To remove when they write the ink-ftandifh from its place, to fee whether they will return to the fame place in in order to take ink. 5. And, laftly, to take notice whether they walk with the fame confidence in a dark and unknown place, as in one with which they are acquainted.

"They likewife recommend to fuch as would confirm or invalidate the above obfervations, to make all their experiments in the dark; becaufe it has been hitherto fuppofed that the eyes of fleep-walkers are of no ufe to them."

SLEEPERS, in *Natural Hiftory*, a name given to thofe animals which fleep all winter; fuch as bears, marmots, dormice, bats, hedgehogs, fwallows, &c. Thefe do not feed in winter, have no fenfible evacuations, breathe little or none at all, and moft of the vifcera ceafe from their functions. Some of thefe animals feem to be dead, and others return to a ftate like that of the fœtus before birth: in this ftate they continue, till by an increafe of heat the animal is reftored to its former functions.

SLEEPERS, in a fhip, timbers lying before and aft in the bottom of the fhip, as the rungheads do: the lowermoft of them is bolted to the rungheads, and the uppermoft to the futtocks and rungs.

SLEIDAN, JOHN, an excellent German hiftorian, born of obfcure parents, in 1506, at Sleidan, a fmall town on the confines of the duchy of Juliers. After ftudying fome time in his own country, together with his townfman the learned John Sturmius, he went to France, and in 1525 entered into the fervice of the cardinal and archbifhop John du Bellay. He retired to Strafburg in 1542, where he acquired the efteem and friendfhip of the moft confiderable perfons, particularly of James Sturmius; by whofe advice and affiftance he was enabled to write the hiftory of his own time. He was employed in fome public negociations; but the death of his wife, in 1555, plunged him into fo deep a melancholy, that he loft his memory entirely, and died the year following. In 1555 came out, in folio, *De ftatu Religionis et Reipublicæ fub Carolo Quinto*, &c. in 15 books; from the year 1517, when Luther began to preach, to the year of its publication; which hiftory was prefently tranflated into moft of the languages of Europe. Befides this great work, he wrote, *De quatuor fummis Imperiis, libri tres;* with fome other hiftorical and political pieces.

SLEIGHT *of* HAND. See LEGERDEMAIN.

SLESWICK, an ancient and confiderable town of Denmark, the metropolis of a duchy of the fame name, in the province of Gottorp, the fee of a bifhop, which was fecularized in the year 1586. The old palace of Gottorp is clofe to it, which was formerly the ducal refidence, but afterwards inhabited by the governor. This town at one period was much more extenfive than it is now, having fuffered greatly by the German wars. It is feated on the gulf of Sley, where there is a commodious harbour, 60 miles north-weft of Lubeck, and 125 fouth-weft of Copenhagen. The people boaft that the German language is here fpoken with as much accuracy as at Vienna, of which, however, a good German fcholar can alone be judge. Slefwick has but little trade, as none but fmall boats can have accefs to it, the paffage of the Sley having been long fince chocked up with fand and mud; before which period it was both flourifhing and populous. It is now chiefly inhabited by the officers of the caftle, and the poorer claffes, or the attendants on the court and on them. The prefent population is faid not to exceed 5000. E. Long. 10. 0. N. Lat. 54. 40.

SLESWICK, the duchy of, or *South Jutland*, is about 100 miles in length and 60 in breadth. It is bounded on the north by North Jutland, on the eaft by the Baltic fea, on the fouth by Holftein, and on the weft by the ocean. It contains 14 cities, 17 towns, 13 caftles, 278 parifhes, 1480 villages, 162 farms, 116 water-mills, and 106 gentlemen's feats. It is a pleafant, fertile, populous country, and a fovereign duchy. Formerly the king of Denmark had half of it, and the other belonged to the houfe of Holftein-Gottorp; but the former having conquered this duchy, had the poffeffion of it confirmed to him by the treaty of the north in 1720. In 1731, a prince of Bareith-Culmbach was made governor of this duchy, who refides at Gottorp.

SLEUT-HOUNDE, the ancient Scots name of the blood-hound. The word is from the Saxon *flot*, "the impreffion that a deer leaves of its foot in the mire," and *hound*, "a dog"; fo they derive their name from following the track. See the article *BLOOD-Hound*.

SLICH, in *Metallurgy*, the ore of any metal, particularly of gold, when it has been pounded, and prepared for farther working.

The manner of preparing the flich at Chremnitz in Hungary is this; they lay a foundation of wood three yards deep, upon this they place the ore, and over this there are 24 beams, armed at their bottoms with iron; thefe, by a continual motion, beat and grind the ore, till it is reduced to powder: during this operation, the ore is covered with water. There are four wheels ufed to move thefe beams, each wheel moving fix; and the water, as it runs off, carrying fome of the metalline particles with it, is received into feveral bafons, one placed behind another; and finally, after having paffed through them all, and depofited, fome fediment in each, it is let off into a very large pit, almoft half an acre in extent; in which it is fuffered to ftand fo long, as to depofit all its fediment, of whatever kind, and after this it is let out. This work is carried on day and night, and the ore taken away and replaced by more as often as occafion requires. That ore which lies next the beams, by which it was pounded, is always the cleaneft or richeft.

When the flich is wafhed as much as they can, a hundred weight of it ufually contains about an ounce, or perhaps but half an ounce of metal, which is not all gold; for there is always a mixture of gold and filver, but the gold is in the largeft quantity, and ufually is two-thirds of the mixture: they then put the flich into a furnace with fome limeftone, and flacken, or the fcoria of former meltings, and run them together. The firft melting produces a fubftance called *lech;* this lech they burn with charcoal, to make it lighter, to open its body, and render it porous, after which it is called *roft;* to this roft they add fand in fuch quantity as they find neceffary, and then melt it over again.

At Chremnitz many other ways are practifed of reducing gold out of its ore, but particularly one, in which they employ no lead during the whole operation; whereas, in general, lead is always neceffary, after the beforementioned proceffes. See *ORES, Reduction of*.

SLIDING RULE, a mathematical inftrument, ferving to work queftions in gauging, meafuring, &c. without

out the use of compasses; merely by the sliding of the parts of the instrument one by another, the lines and divisions whereof give the answer by inspection.

This instrument is variously contrived, and applied by various authors, particularly Everard, Coggeshall, Gunter, Hunt, and Partridge; but the most common and useful are those of Everard and Coggeshall.

SLIGO, a county in the province of Connaught, Ireland, 25 miles in length, and as much in breadth; bounded on the east by that of Leitrim, on the west by the county of Mayo, on the north and north-west by the western ocean, and on the south and south-west by Roscommon and Mayo. It contains 5970 houses, 41 parishes, 6 baronies, 1 borough, and sends 4 members to parliament, two for the county, and two for the borough of the same name, which is the only market-town in the county, and is seated on a bay of the same name, 30 miles west of Killalla, and 110 north-east of Dublin. W. Long. 8. 26. N. Lat. 54. 13.

SLING, an instrument serving for casting stones with great violence. The inhabitants of the Balearic islands were famous in antiquity for the dexterous management of the sling; it is said they used three kinds of slings, some longer, others shorter, which they used according as their enemies were either nearer or more remote. It is added, that the first served them for a head-band, the second for a girdle, and that the third they constantly carried in their hand.

SLINGING is used variously at sea; but chiefly for hoisting up casks or other heavy things with slings, *i. e.* contrivances of ropes spliced into themselves at either end, with one eye big enough to receive the cask or whatever is to be slung. There are other slings, which are made longer, and with a small eye at each end; one of which is put over the breech of a piece of ordnance, and the other eye comes over the end of an iron crow, which is put into the mouth of the piece, to weigh and hoise the gun as they please. There are also slings by which the yards are bound fast to the cross-tree aloft, and to the head of the mast, with a strong rope or chain, that if the tie should happen to break, or to be shot to pieces in fight, the yard, nevertheless, may not fall upon the hatches.

SLINGING a Man overboard, in order to stop a leak in a ship, is done thus: the man is trussed up about the middle in a piece of canvas, and a rope to keep him from sinking, with his arms at liberty, a mallet in one hand and a plug, wrapped in oakum and well tarred in a tarpawling clout, in the other, which he is to beat with all dispatch into the hole or leak.

SLOANE, Sir Hans, Baronet, eminently distinguished as a physician and a naturalist, was of Scotch extraction, his father Alexander Sloane being at the head of that colony of Scots which King James I. settled in the north of Ireland, where our author was born, at Killieagh, on the 19th of April 1660. At a very early period, he displayed a strong inclination for natural history; and this propensity being encouraged by a suitable education, he employed those hours which young people generally lose by pursuing low and trifling amusements, in the study of nature, and contemplating her works. When about sixteen, he was attacked by a spitting of blood, which threatened to be attended with considerable danger, and which interrupted the regular course of his application for three years; he had, however, already learned enough of physic to know that a malady of this kind was not to be removed suddenly, and he prudently abstained from wine and other liquors that were likely to increase it.

By strictly observing this severe regimen, which in some measure he continued ever after, he was enabled to prolong his life beyond the ordinary bounds; being an example of the truth of his own favourite maxim, that sobriety, temperance, and moderation, are the best and most powerful preservatives that nature has granted to mankind.

As soon as he recovered from this infirmity, he resolved to perfect himself in the different branches of physic, which was the profession he had made choice of; and with this view he repaired to London, where he hoped to receive that assistance which he could not find in his own country.

On his arrival in the metropolis, he entered himself as a pupil to the great Stafforth, an excellent chemist, bred under the illustrious Stahl; and by his instructions he gained a perfect knowledge of the composition and preparation of the different kinds of medicines then in use. At the same time, he studied botany at the celebrated garden at Chelsea, assiduously attended the public lectures of anatomy and physic, and in short neglected nothing that he thought likely to prove serviceable to him in his future practice. His principal merit, however, was his knowledge of natural history; and it was this part of his character which introduced him early to the acquaintance of Mr Boyle and Mr Ray, two of the most eminent naturalists of that age. His intimacy with these distinguished characters continued as long as they lived; and as he was careful to communicate to them every object of curiosity that attracted his attention, the observations which he occasionally made often excited their admiration and obtained their applause.

After studying four years at London with unremitting severity, Mr Sloane determined to visit foreign countries for farther improvement. In this view he set out for France in the company of two other students, and having crossed to Dieppe, proceeded to Paris. In the way thither they were elegantly entertained by the famous M. Lemery the elder; and in return Mr Sloane presented that eminent chemist with a specimen of four different kinds of phosphorus, of which, upon the credit of other writers, M. Lemery had treated in his book of chemistry, though he had never seen any of them.

At Paris Mr Sloane lived as he had done in London. He attended the hospitals, heard the lectures of Tournefort, De Verney, and other eminent masters; visited all the literati, who received him with particular marks of esteem, and employed himself wholly in study.

From Paris Mr Sloane went to Montpelier; and, being furnished with letters of recommendation from M. Tournefort to M. Chirac, then chancellor of that university, he found easy access, through his means, to all the learned men of the province, particularly to M. Magnol, whom he always accompanied in his botanical excursions in the environs of that city, where he beheld with pleasure and admiration the spontaneous productions of nature, and learned under his instructions to class them in a proper manner.

Sloane.

Having here found an ample field for contemplation, which was entirely suited to his taste, he took leave of his two companions, whom a curiosity of a different kind led into Italy.

After spending a whole year in collecting plants, he travelled through Languedoc with the same design; and passing through Thoulouse and Bourdeaux, returned to Paris, where he made a short stay. About the end of the year 1684 he set out for England, with an intention of settling there as a physician. On his arrival in London, he made it his first business to visit his two illustrious friends Mr Ray and Mr Boyle, in order to communicate to them the discoveries he had made in his travels. The latter he found at home, but the former had retired to Essex; to which place Mr Sloane transmitted a great variety of plants and seeds, which Mr Ray has described in his History of Plants, and for which he makes a proper acknowledgement.

About the year 1706 our author became acquainted with the celebrated Sydenham; who soon contracted so warm an affection for him that he took him into his house, and recommended him in the strongest manner to his patients. He had not been long in London before he was proposed by Dr Martin Lister as a candidate to be admitted a member of the Royal Society, on the 26th of November 1684; and being approved, he was elected on the 21st of January following.

In 1685 he communicated some curiosities to the Society; and in July the same year he was a candidate for the office of their assistant secretary, but without success, as he was obliged to give way to the superior interest of his competitor Dr Halley. On the 12th of April 1687, he was chosen a fellow of the college of physicians in London; and the same year his friend and fellow traveller Dr Tancred Robinson, having mentioned to the Society the plant called the *star of the earth*, as a remedy newly discovered for the bite of a mad dog, Dr Sloane acquainted them that this virtue of the plant was to be found in a book called *De Grey's Farriery*; and that he knew a man who had cured with it twenty couple of dogs. This observation he made on the 13th of July, and on the 12th of September following he embarked at Portsmouth for Jamaica with the duke of Albemarle, who had been appointed governor of that island. The doctor attended his grace in quality of physician, and arrived at Jamaica on the 19th of December following.

Here a new field was opened for fresh discoveries in natural productions; but the world would have been deprived of the fruits of them, had not our author, by incredible application, converted, as we may say, his minutes into hours. The duke of Albemarle died soon after he landed, and the duchess determined to return to England whenever an answer should be received to the letter she had sent to court on that melancholy occasion. As Dr Sloane could not think of leaving her grace in her distress, whilst the rest of her retinue were preparing for their departure he improved it in making collections of natural curiosities; so that though his whole stay at Jamaica was not above fifteen months, he brought together such a prodigious number of plants, that on his return to England Mr Ray was astonished that one man could procure in one island, and in so short a space, so vast a variety.

On his arrival in London he applied himself to the practice of his profession; and soon became so eminent, that he was chosen physician to Christ's Hospital on the 17th October 1694: and this office he held till the year 1730, when, on account of his great age and infirmities, he found it necessary to resign. It is somewhat singular, and redounds much to the Doctor's honour, that though he received the emoluments of his office punctually, because he would not lay down a precedent which might hurt his successors, yet he constantly applied the money to the relief of those who were the greatest objects of compassion in the hospital, that it might never be said he enriched himself by giving health to the poor. He had been elected secretary to the Royal Society on the 30th of November 1693; and upon this occasion he revived the publication of the Philosophical Transactions, which had been omitted for some time. He continued to be the editor of this work till the year 1712; and the volumes which appeared during that period are monuments of his industry and ingenuity, many of the pieces contained in them being written by himself.

Sloane.

In the mean time he published *Catalogus Plantarum quæ in Insula Jamaica sponte proveniunt*, &c.; *seu Prodromi Historiæ Naturalis pars prima*; which he dedicated to the Royal Society and College of Physicians. About the same time he formed the plan of a dispensary, where the poor might be furnished at prime cost with such medicines as their several maladies might require; which he afterwards carried into execution, with the assistance of the president and other members of the college of physicians.

Our author's thirst for natural knowledge seems to have been born with him, so that his cabinet of curiosities may be said to have commenced with his being. He was continually enriching and enlarging it; and the fame which, in the course of a few years, it had acquired, brought every thing that was curious in art or nature to be first offered to him for purchase. These acquisitions, however, increased it but very slowly in comparison of the augmentation it received in 1701 by the death of William Courten, Esq. a gentleman who had employed all his time, and the greater part of his fortune, in collecting rarities, and who bequeathed the whole to Dr Sloane, on condition of his paying certain debts and legacies with which he had charged it. These terms our author accepted, and he executed the will of the donor with the most scrupulous exactness; on which account some people have said, that he purchased Mr Courten's curiosities at a dear rate.

In 1707 the first volume of Dr Sloane's Natural History of Jamaica appeared in folio, though the publication of the second was delayed till 1725. By this very useful as well as magnificent work, the materia medica was enriched with a great number of excellent drugs not before known. In 1708 the Doctor was elected a foreign member of the Royal Academy of Sciences at Paris, in the room of Mr Tschirnaus; an honour so much the greater, as we were then at war with France, and the queen's express consent was necessary before he could accept it. In proportion as his credit rose among the learned, his practice increased among the people of rank: Queen Anne herself frequently consulted him, and in her last illness was blooded by him.

On the advancement of George I. to the throne, that prince, on the 3d of April 1716, created the Doctor a baronet, an hereditary title of honour to which

no

Sloane. no English physician had before attained; and at the same time made him physician general to the army, in which station he continued till 1727, when he was appointed physician in ordinary to George II. He attended the royal family till his death; and was particularly favoured by Queen Caroline, who placed the greatest confidence in his prescriptions. In the mean time he had been unanimously chosen one of the elects of the college of physicians June 1. 1716, and he was elected president of the same body on September 30. 1719, an office which he held for sixteen years. During that period he not only gave the highest proofs of his zeal and assiduity in the discharge of his duty, but in 1721 made a present to that society of 100l.; and so far remitted a very considerable debt, which the corporation owed him, as to accept it in such small sums as were least inconvenient to the state of their affairs. Sir Hans was no less liberal to other learned bodies. He had no sooner purchased the manor of Chelsea, than he gave the company of apothecaries the entire freehold of their botanical garden there, upon condition only that they should present yearly to the Royal Society fifty new plants, till the number should amount to 2000 (A). He gave besides several other considerable donations for the improvement of this garden; the situation of which, on the banks of the Thames, and in the neighbourhood of the capital, was such as to render it useful in two respects: First, by producing the most rare medicinal plants; and, secondly, by serving as an excellent school for young botanists; an advantage which he himself had derived from it in the early part of his life.

The death of Sir Isaac Newton, which happened in 1727, made way for the advancement of Sir Hans to the presidency of the Royal Society. He had been vice-president, and frequently sat in the chair for that great man; and by his long connection with this learned body he had contracted so strong an affection for it, that he made them a present of an hundred guineas, caused a curious bust of King Charles II. its founder, to be erected in the great hall where it met, and, as is said, was very instrumental in procuring Sir Godfrey Copley's benefaction of a medal of the value of five guineas, to be annually given as an honorary mark of distinction to the person who communicates the best experiments to the Society.

On his being raised to the chair, Sir Hans laid aside all thoughts of further promotion, and applied himself wholly to the faithful discharge of the duties of the offices which he enjoyed. In this laudable occupation he employed his time from 1727 to 1740, when, at the age of fourscore, he formed a resolution of quitting the service of the public, and of living for himself. With this view he resigned the presidency of the Royal Society much against the inclination of that respectable body, who chose Martin Folkes, Esq. to succeed him, and in a public assembly thanked him for the great and eminent services he had rendered them. In the month of January 1741, he began to remove his library, and his cabinet of rarities, from his house in Bloomsbury to that at Chelsea; and on the 12th of March following, having settled all his affairs, he retired thither himself, to enjoy in peaceful tranquillity the remains of a well-spent life. He did not, however, bury himself in that solitude which excludes men from society. He received at Chelsea, as he had done in London, the visits of people of distinction, of all learned foreigners, and of the royal family, who sometimes did him the honour to wait on him; but, what was still more to his praise, he never refused admittance or advice to rich or poor who came to consult him concerning their health. Not contented with this contracted method of doing good, he now, during his retreat, presented to the public such useful remedies as success had warranted, during the course of a long continued practice. Among these is the efficacious receipt for distempers in the eyes, and his remedy for the bite of a mad dog.

During the whole course of his life, Sir Hans had lived with so much temperance, as had preserved him from feeling the infirmities of old age; but in his 90th year he began to complain of pains, and to be sensible of an universal decay. He was often heard to say, that the approach of death brought no terrors along with it; that he had long expected the stroke; and that he was prepared to receive it whenever the great Author of his being should think fit. After a short illness of three days, he died on the 11th of January 1752, and was interred on the 18th at Chelsea, in the same vault with his lady, the solemnity being attended with the greatest concourse of people, of all ranks and conditions, that had ever been seen before on the like occasion.

Sir Hans being extremely solicitous lest his cabinet of curiosities, which he had taken so much pains to collect, should be again dissipated at his death, and being at the same time unwilling that so large a portion of his fortune should be lost to his children, he bequeathed it to the public, on condition that 20,000l. should be made good by parliament to his family. This sum, though large in appearance, was scarcely more than the intrinsic value of the gold and silver medals, the ores and precious stones that were found in it; for in his last will he declares, that the first cost of the whole amounted at least to 50,000l. Besides his library, consisting

(A) This garden was first established by the company in 1673; and having after that period been stocked by them with a great variety of plants, for the improvement of botany, Sir Hans, in order to encourage so serviceable an undertaking, granted to the company the inheritance of it, being part of his estate and manor of Chelsea, on condition that it should be for ever preserved as a physic garden. As a proof of its being so maintained, he obliged the company, in consideration of the said grant, to present yearly to the Royal Society, in one of their weekly meetings, fifty specimens of plants that had grown in the garden the preceding year, and which were all to be specifically distinct from each other, until the number of two thousand should be completed. This number was completed in the year 1761. In 1733 the company erected a marble statue of Sir Hans, executed by Rysbrac, which is placed upon a pedestal in the centre of the garden, with a Latin inscription, expressing his donation, and the design and advantages of it.

fifting of more than 50,000 volumes, 347 of which were illuftrated with cuts finely engraven and coloured from nature, there were 3560 manufcripts, and an infinite number of rare and curious works of every kind. The parliament accepted the legacy, and fulfilled the conditions.

SLOANEA, a genus of plants belonging to the clafs of polyandria, and order of monogynia; and in the natural fyftem ranging under the 50th order, *Amentaceæ*. See BOTANY *Index*.

SLOE. See PRUNUS, BOTANY *Index*.

SLOOP, a fmall veffel furnifhed with one maft, the mainfail of which is attached to a gaff above, or to the maft on its foremoft edge, and to a long boom below, by which it is occafionally fhifted to either quarter. See SHIP.

SLOOP of War, a name given to the fmalleft veffels of war except cutters. They are either rigged as fhips or fnows.

SLOT, in the fportfman's language, a term ufed to exprefs the mark of the foot of a ftag or other animal proper for the chace in the clay or earth, by which they are able to guefs when the animal paffed, and which way he went. The flot, or treading of the ftag, is very nicely ftudied on this occafion; if the flot be large, deep printed in the ground, and with an open cleft, and, added to thefe marks, there is a large fpace between mark and mark, it is certain that the ftag is an old one. If there be obferved the flots or treadings of two, the one long and the other round, and both of one fize, the long flot is always that of the larger animal. There is alfo another way of knowing the old ones from the young ones by the treading; which is, that the hinder feet of the old ones never reach to their fore feet, whereas thofe of the young ones do.

SLOTH. See BRADYPUS, MAMMALIA *Index*.

SLOUGH, a deep muddy place. The caft fkin of a fnake, the damp of a coal pit, and the fcar of a wound, are alfo called by the fame appellation. The flough of a wild boar is the bed, foil, or mire, wherein he wallows, or in which he lies in the day-time.

SLUCZK, a large and populous town in Poland, in Lithuania, and capital of a duchy of the fame name; famous for three battles gained here by Conftantine duke of Oftrog over the Tartars, in the reign of Sigifmund I. It is feated on the river Sluczk, 72 miles fouth-eaft of Minfki, and 70 fouth of Novogrodeck. E. Long. 27. 44. N. Lat. 53. 2.

SLUG. See LIMAX, HELMINTHOLOGY *Index*.

SLUICE, a frame of timber, ftone, or other matter, ferving to retain and raife the water of a river, &c. and on occafion to let it pafs.

Such is the fluice of a mill, which ftops and collects the water of a rivulet, &c. to let it fall at length in the greater plenty upon the mill-wheel; fuch alfo are thofe ufed as vents or drains to difcharge water off land. And fuch are the fluices of Flanders, &c. which ferve to prevent the waters of the fea from overflowing the lower lands.

Sometimes there is a kind of canal inclofed between two gates or fluices, in artificial navigations, to fave the water, and render the paffage of boats equally eafy and fafe, upwards and downwards; as in the fluices of Briare in France, which are a kind of maffive walls built parallel to each other, at the diftance of 20 or 24 feet, clofed with ftrong gates at each end, between which is a kind of canal or chamber, confiderably longer than broad; wherein a veffel being inclofed, the water is let out at the firft gate, by which the veffel is raifed 15 or 16 feet, and paffed out of this canal into another much higher. By fuch means a boat is conveyed out of the Loire into the Seine, though the ground between them rife above 150 feet higher than either of thofe rivers *.

* See Canal.

Sluices are made different ways, according to the ufe for which they are intended: when they ferve for navigation, they are fhut with two gates, prefenting an angle towards the ftream; when they are made near the fea, two pair of gates are made, the one to keep the water out and the other in, as occafion requires: in this cafe, the gates towards the fea prefent an angle that way, and the others the contrary way; and the fpace inclofed by thofe gates is called the *chamber*. When fluices are made in the ditches of a fortrefs, to keep up the water in fome parts, inftead of gates, fhutters are made fo as to flide up and down in grooves; and when they are made to raife an inundation, they are then fhut by means of fquare timbers let down in cullifes, fo as to lie clofe and firm.

The word *fluice* is formed of the French *efclufe*, which Menage derives from the Latin *exclufa*, found in the Salic law in the fame fenfe. But this is to be reftrained to the fluices of mills, &c. for as to thofe ferving to raife veffels, they were wholly unknown to the ancients.

SLUR, in *Mufic*, a mark like the arch of a circle, drawn from one note to another, comprehending two or more notes in the fame or different degrees. If the notes are in different degrees, it fignifies that they are all to be fung to one fyllable; for wind inftruments, that they are to be made in one continued breath; and for ftringed inftruments that are ftruck with a bow, as a violin, &c. that they are made with one ftroke. If the notes are in the fame degree, it fignifies that it is all one note, to be made as long as the whole notes fo connected; and this happens moft frequently betwixt the laft note of one line and the firft of the next; which is particularly called *fyncopation*.

SLUYS, a town of Dutch Flanders, oppofite the ifland of Cadfand, with a good harbour, 10 miles north of Bruges, containing 14,000 inhabitants. E. Long. 3. 25. N. Lat. 51. 19.

SMACK, a fmall veffel, commonly rigged as a floop or hoy, ufed in the coafting or fifhing trade, or as a tender in the king's fervice.

SMALAND, or EAST GOTHLAND, a province of Sweden, which makes part of Gothland; and is bounded on the north by Oftrogothia or Eaft Gothland, on the eaft by the Baltic fea, on the fouth by Schonen and Bleckingia, and on the weft by Weftrogothia or Weft Gothland. It is about 112 miles in length, and 62 in breadth. Calmar is the capital town.

SMALKALD, a town of Germany, in Franconia, and in the county of Henneberg: famous for the confederacy entered into by the German Proteftants againft the emperor, commonly called the *league of Smalkald*. The defign of it was to defend their religion and liberties. It is feated on ehe river Werra, 25 miles fouth-weft of Erford, and 50 north-weft of Bamberg. E. Long. 10. 53. N. Lat. 50. 49. It is fubject to the prince of Heffe-Caffel.

SMALLAGE. See APIUM, BOTANY *Index*.

SMALT, a kind of glafs of a dark blue colour, which when levigated appears of a moft beautiful colour; and if it could be made fufficiently fine, would be an excellent fuccedaneum for ultramarine, as not only refifting all kinds of weather, but even the moft violent fires. It is prepared by melting one part of calcined cobalt with two of flint powder, and one of potafh. At the bottoms of the crucibles in which the fmalt is manufactured we generally find a regulus of a whitifh colour inclined to red, and extremely brittle. This is melted afrefh, and when cold feparates into two parts; that at the bottom is the cobaltic regulus, which is employed to make more of the fmalt; the other is bifmuth.

SMARAGDITE, a fpecies of mineral belonging to the magnefian genus. See MINERALOGY, p. 197.

SMARAGDUS, an old name for the emerald. See EMERALD, MINERALOGY, p. 159.

SMEATON, JOHN, an eminent civil engineer, was born the 28th of May 1724, O. S. at Aufthorpe, near Leeds, in a houfe built by his grandfather, and where his family have refided ever fince.

The ftrength of his underftanding and the originality of his genius appeared at an early age; his playthings were not the playthings of children, but the tools which men employ; and he appeared to have greater entertainment in feeing the men in the neighbourhood work, and afking them queftions, than in any thing elfe. One day he was feen (to the diftrefs of his family) on the top of his father's barn, fixing up fomething like a windmill; another time, he attended fome men fixing a pump at a neighbouring village, and obferving them cut off a piece of bored pipe, he was fo lucky as to procure it, and he actually made with it a working pump that raifed water. Thefe anecdotes refer to circumftances that happened while he was in petticoats, and moft likely before he attained his fixth year.

About his 14th and 15th year, he made for himfelf an engine for turning, and made feveral prefents to his friends of boxes in ivory or wood very neatly turned. He forged his iron and fteel, and melted his metal; he had tools of every fort for working in wood, ivory, and metals. He made a lathe, by which he cut a perpetual fcrew in brafs, a thing little known at that day, which was the invention of Mr Henry Hindley of York; with whom Mr Smeaton foon became acquainted, and they fpent many a night at Mr Hindley's houfe till day-light, converfing on thofe fubjects.

Thus had Mr Smeaton, by the ftrength of his genius and indefatigable induftry, acquired, at the age of 18, an extenfive fet of tools, and the art of working in moft of the mechanical trades, without the affiftance of any mafter. A part of every day was generally occupied in forming fome ingenious piece of mechanifm.

Mr Smeaton's father was an attorney, and defirous of bringing him up to the fame profeffion; Mr Smeaton therefore came up to London in 1742, and attended the courts in Weftminfter hall; but finding (as his common expreffion was) that the law did not fuit the bent of his genius, he wrote a ftrong memorial to his father on that fubject; whofe good fenfe from that moment left Mr Smeaton to purfue the bent of his genius in his own way.

In 1751 he began a courfe of experiments to try a machine of his invention to meafure a fhip's way at fea, and alfo made two voyages in company with Dr Knight to try it, and a compafs of his own invention and making, which was made magnetical by Dr Knight's artificial magnets: the fecond voyage was made in the Fortune floop of war, commanded at that time by Captain Alexander Campbell.

In 1753 he was elected member of the Royal Society; the number of papers publifhed in their Tranfactions will fhow the univerfality of his genius and knowledge. In 1759 he was honoured by an unanimous vote with their gold medal for his paper intitled "An Experimental Inquiry concerning the Natural Powers of Water and Wind to turn Mills, and other Machines depending on a Circular Motion."

This paper, he fays, was the refult of experiments made on working models in the years 1752 and 1753, but not communicated to the Society till 1759; before which time he had an opportunity of putting the effect of thefe experiments into real practice, in a variety of cafes, and for various purpofes, fo as to affure the Society he had found them to anfwer.

In December 1755, the Eddyftone lighthoufe was burnt down: Mr Wefton, the chief proprietor, and the others, being defirous of rebuilding it in the moft fubftantial manner, inquired of the earl of Macclesfield (then prefident of the Royal Society) whom he thought the moft proper to rebuild it; his Lordfhip recommended Mr Smeaton.

Mr Smeaton undertook the work, and completed it in the fummer of 1759. Of this Mr Smeaton gives an ample defcription in the volume he publifhed in 1791: that edition has been fold fome time ago, and a fecond is now in the prefs, under the revifal of his much efteemed friend Mr Aubert, F. R. S. and governor of the London affurance corporation.

Though Mr Smeaton completed the building of the Eddyftone lighthoufe in 1759 (a work that does him fo much credit) yet it appears he did not foon get into full bufinefs as a civil engineer; but in 1764, while in Yorkfhire, he offered himfelf a candidate for one of the receivers of the Derwentwater eftate, and on the 31ft of December in that year, he was appointed at a full board of Greenwich hofpital, in a manner highly flattering to himfelf; when two other perfons ftrongly recommended and powerfully fupported were candidates for the employment. In this appointment he was very happy, by the affiftance and abilities of his partner Mr Walton one of the receivers, who taking upon himfelf the management and accounts, left Mr Smeaton leifure and opportunity to exert his abilities on public works, as well as to make many improvements in the mills and in the eftates of Greenwich hofpital. By the year 1775 he had fo much bufinefs as a civil engineer, that he wifhed to refign this appointment; and would have done it then, had not his friend the late Mr Stuart the hofpital furveyor, and Mr Ibbetfon their fecretary, prevailed upon him to continue in the office about two years longer.

Mr Smeaton having now got into full bufinefs as a civil engineer, performed many works of general utility. He made the river Calder navigable; a work that required great fkill and judgement, owing to the very impetuous floods in that river: He planned and attended the execution of the great canal in Scotland for conveying the trade of the country either to the Atlantic or German ocean; and having brought it to the place originally intended, he declined a handfome yearly falary, in order that he might attend to the multiplicity of his other bufinefs.

On the opening of the great arch at London bridge, the excavation around and under the fterlings was fo confiderable, that the bridge was thought to be in great danger of falling. He was then in Yorkfhire, and was fent for by exprefs, and arrived with the utmoft difpatch: "I think (fays Mr Holmes, the author of his life) it was on a Saturday morning, when the apprehenfion of the bridge was fo general that few would pafs over or under it. He applied himfelf immediately to examine it, and to found about the fterlings as minutely as he could; and the committee being called together, adopted his advice, which was to repurchafe the ftones that had been taken from the middle pier, then lying in Moorfields. and to throw them into the river to guard the fterlings." Nothing fhows the apprehenfions concerning the falling of the bridge more than the alacrity with which this advice was purfued; the ftones were repurchafed that day, horfes, carts, and barges were got ready, and they began the work on Sunday morning. Thus Mr Smeaton, in all human probability, faved London bridge from falling, and fecured it till more effectual methods could be taken.

The vaft variety of mills which Mr Smeaton conftructed, fo greatly to the fatisfaction and advantage of the owners, will fhow the great ufe which he made of his experiments in 1752 and 1753; for he never trufted to theory in any cafe where he could have an opportunity to inveftigate it by experiment. He built a fteam engine at Aufthorpe, and made experiments thereon, purpofely to afcertain the power of Newcomen's fteam-engine, which he improved and brought to a greater degree of perfection, both in its conftruction and powers, than it was before.

Mr Smeaton during many years of his life was a frequent attendant on parliament, his opinion being continually called for; and here his ftrength of judgement and perfpicuity of expreffion had its full difplay: it was his conftant cuftom, when applied to, to plan or fupport any meafure, to make himfelf fully acquainted with it, to fee its merits before he would engage in it: by this caution, added to the clearnefs of his defcription and the integrity of his heart, he feldom failed to obtain for the bill which he fupported an act of parliament. No one was heard with more attention, nor had any one ever more confidence placed in his teftimony. In the courts of law he had feveral compliments paid him from the bench by Lord Mansfield and others, for the new light which he threw on difficult fubjects.

About the year 1785 Mr Smeaton's health began to decline; and he then took the refolution to endeavour to avoid all the bufinefs he could, fo that he might have leifure to publifh an account of his inventions and works, which was certainly the firft wifh of his heart; for he has often been heard to fay, that "he thought he could not render fo much fervice to his country as by doing that." He got only his account of the Eddyftone lighthoufe completed, and fome preparations to his intended Treatife on Mills; for he could not refift the folicitations of his friends in various works: and Mr Aubert, whom he greatly loved and refpected, being chofen chairman of Ramfgate harbour, prevailed upon him to accept the place of engineer to that harbour; and to their joint efforts the public is chiefly indebted for the improvements that have been made there within thefe few years, which fully appears in a report that Mr Smeaton gave in to the board of truftees in 1791, which they immediately publifhed.

Mr Smeaton being at Aufthorpe, walking in his garden on the 16th of September 1792, was ftruck with the palfy, and died the 28th of October. "In his illnefs (fays Mr Holmes) I had feveral letters from him, figned with his name, but written and figned by another's pen; the diction of them fhowed that the ftrength his mind had not left him. In one written the 26th of September, after minutely defcribing his health and feelings, he fays, "in confequence of the foregoing, I conclude myfelf nine-tenths dead; and the greateft favour the Almighty can do me (as I think), will be to complete the other part; but as it is likely to be a lingering illnefs, it is only in His power to fay when that is likely to happen."

Mr Smeaton had a warmth of expreffion that might appear to thofe who did not know him well to border on harfhnefs; but thofe more intimately acquainted with him, knew it arofe from the intenfe application of his mind, which was always in the purfuit of truth, or engaged in inveftigating difficult fubjects. He would fometimes break out haftily, when any thing was faid that did not tally with his ideas; and he would not give up any thing he argued for, till his mind was convinced by found reafoning.

In all the focial duties of life he was exemplary; he was a moft affectionate hufband, a good father, a warm, zealous, and fincere friend, always ready to affift thofe he refpected, and often before it was pointed out to him in what way he could ferve them. He was a lover and encourager of merit whatever he found it; and many men are in a great meafure indebted to his affiftance and advice for their prefent fituation. As a companion, he was always entertaining and inftructive; and none could fpend any time in his company without improvement.

SMELL; this word has in moft languages two meanings, fignifying either that fenfation of mind of which we are confcious, in confequence of certain impreffions made on the noftrils, and conveyed to the brain by the olfactory nerves; or that unknown virtue, or quality in bodies, which is the caufe of our fenfations of fmell.

SMELLING is the act by which we perceive fmells, or become fenfible of the prefence of odorous bodies. The fenfations of fmell are excited by certain effluvia, which, in the open air, are always iffuing from the furfaces of moft bodies, and ftriking on the extremities of the olfactory nerves, give them a peculiar fort of impreffion, which is communicated to the brain. The particles which iffue thus from bodies are extremely volatile, and produce fenfation by a degree of contact, which, though infenfible, is ftill more efficient than if it were more grofs and palpable. It is by a fimilar fpecies of infenfible contact that the eyes and ears are affected by external objects; whilft, in the excitation of the fenfations of touch and of tafte, an actual and fenfible contact of the object with the organ is necef-

Smelling.

sary. The organs of smelling are the nostrils and olfactory nerves; the minute ramifications of the latter being distributed throughout the whole concavity of the former. For a description of these, see ANATOMY.

The effluvia from odorous bodies are constantly floating about in the atmosphere, and must of course be drawn into the nostrils along with the air in inspiration; "so that there is," as Dr Reid observes, "a manifest appearance of design in placing the organ of smell in the inside of that canal, through which the air is continually passing in inspiration and expiration." It has been affirmed by Boerhaave, that the matter in animals, vegetables, fossils, &c. which chiefly affects the sense of smelling, is that attenuated substance, inherent in their oily parts, called *spirits;* because, when this is taken away from the most fragrant bodies, what remains has scarcely any smell at all; but this, he says, if poured on the most inodorous bodies, gives them a fragrancy *. We cannot, however, enter at present upon this inquiry.

* See also *Drummond's Academical Questions*, vol. i. book i. ch 9.

The sense of smell has a close alliance with that of taste; and it seems probable from the proximity in the situation of their organs in all animals, that both are principally intended to guide them in the choice of their food; so that from this close connection, they are better enabled to choose what is good for them, and to reject what would be injurious. This is the opinion of Dr Reid, as it was, in a very early period of the history of philosophy, that of Socrates and of Cicero (A). Dr Reid also remarks, that the sense of smell probably serves the same purpose in the natural state of man; but it is not always a sure guide for this purpose. The organs of smell differ, like those of the other senses, according to the destination of the animals to which they belong; and we know, that this sense is in man much less acute, than it is in many other animals. We see, that in the choice of their food, they are guided by the senses of smell and of taste, except when man has brought them into a sort of unnatural state by domestication. And this circumstance renders it probable, that both these senses were intended to serve the same purpose in the natural state of our species, although less calculated for this end than they are in the brutes, on account of the great superiority of their smelling organs. Besides, since it is probable that man, in the natural state, acts more by instinct than when civilized in society, so also it is reasonable to think, that he may possess some of the senses, (this of smell for instance), in greater acuteness than we do. This indeed, we are assured to be a fact; for we are told, in the *Histoire des Antilles*, that there are negroes who, by the smell alone, can distinguish the footsteps of a Frenchman from those of a negro.

The sense of smell is much more obtuse in man than in some of the lower animals. Dogs we know possess a power of smelling, of which we can scarcely form a conception, and which, it is happy for us we do not possess (B); and birds of prey are said to possess this sense in still greater acuteness. But although this be more perfect, still the sense of smelling in man, who has other means of judging of his food, &c. is such as to fit him for deriving enjoyment from a diversity of scents, particularly those of flowers and perfumes, to which dogs and other animals seem perfectly insensible. It has been said, we are aware, that some animals, the elephant for instance, are capable of this enjoyment (C); but of this fact we cannot help being very doubtful.

There is a very great sympathy between the organs of smell and of taste; for any defect or disease of one is generally attended with some corresponding defect or disease of the other. There is also a greater similarity between the sensations of both these, than between those of any other two senses: and hence it is, that we can sometimes tell the taste of an object from its smell, and *vice versa*. Hence also the reason why we apply the same epithets to the names of both these classes of sensations; as a sweet smell or taste, &c.

It deserves also to be remarked, that both these senses seem subservient to the preservation of the animal existence, rather than to any other purpose. They accordingly constitute an object of the natural history of man, rather than of intellectual or of moral philosophy. The other three senses, on the contrary, seem rather intended for (as they certainly are essential to) our intellectual improvement, and become, of course, a proper object of investigation in the sciences of moral philosophy, or metaphysics.

The advantages derived by man and the other animals from the sense of smelling are not confined to the assistance which it affords them in the choice of their food. Most bodies in nature, when exposed to the open air, are constantly sending forth emanations or effluvia of such extreme minuteness as to be perfectly invisible. These diffuse themselves through the air, and however noxious or salutary, would not be perceived without the sense of smelling, which if not vitiated by unnatural habits, is not only a faithful monitor when danger is at hand, but conveys to us likewise the most exquisite pleasures

(A) "Ut gustus (says a learned physiologist) cibi itineri, sic olfactus ostio viarum, quas aër subire debet, custos præponitur, moniturus ne quid noxii, via quæ semper patet, in corpus admittatur. Porro, ut gustus, sic quoque olfactus ad salutarem cibum invitat, à noxio aut corrupto, putrido imprimis vel rancido, deterret."

"When thou seest the mouth, through which animals take in whatever they desire, always placed near the nose and eyes, thinkest thou not, says Socrates to Aristodemus, that this is the work of a providence." Xenophon's Memorables, book i. chap. 4.

(B) "The excessive eagerness which dogs express on smelling their game, seems to be but little connected with the appetite for food, and wholly independent of any preconceived ideas of the objects of their pursuit being fit for it. Hence several kinds of them will not eat the game which they pursue with such wild impetuosity; and of which the scent seems to animate them to a degree of ecstasy far beyond what the desire of food can produce." Knight on Taste.

(C) There is an animal to which, naturalists say, perfume is so agreeable and so necessary, that nature has provided it with a little bag stored with an exquisite odour. "On pretend, (says Buffon,) que la mangouste ouvre cette poche, pour se refraichir lorsqu' elle a trop chaud."

Smelling.

pleaſures. The fragrance of a roſe, and of many other flowers, is not only pleaſant, but gives a refreſhing and delightful ſtimulus to the whole ſyſtem, whilſt the odours proceeding from hemlock, or any noxious vegetable, or other ſubſtance, are highly offenſive to our noſtrils. Hence we are naturally led to ſeek the one claſs of ſenſations, and to avoid the other.

In ſome ſpecies of animals the ſenſe of ſmell ſeems to be connected with certain mental ſympathies, as thoſe of hearing and ſight are in all that poſſeſs them in any high degree: for not only their ſexual deſires appear to be excited by means of it, but other inſtinctive paſſions, which, according to the uſual ſyſtem of nature, ſhould be ſtill more remote from its influence. Dogs, although wholly unacquainted with lions, will ſhudder at their roar; and an elephant that has never ſeen a tiger, will in the ſame manner ſhow the ſtrongeſt ſymptoms of horror and affright at the ſmell of it. "The late Lord Clive (ſays an ingenious writer), exhibited a combat between two of theſe animals at Calcutta; but the ſcent of the tiger had ſuch an effect upon the elephant, that nothing could either force or allure him to go along the road, where the cage in which the tiger was incloſed, had paſſed, until a gallon of arack was given him. Upon this, his horror ſuddenly turning into fury, he broke down the paling to get at his enemy, and killed him without difficulty."

If riding along a road, near which a dead horſe, or part of its carcaſs, happens to be lying, we know, that our horſe, although he ſees it not, cannot be made to paſs the place but with difficulty. Where blood has been ſhed, particularly that of their own ſpecies, oxen will aſſemble, and upon ſmelling it, roar and bellow, and ſhow the moſt manifeſt ſigns of horror and diſtreſs. And yet theſe ſymptoms could not ariſe from any aſſociated notions of danger or death, ſince they appear in ſuch as never had any opportunities of acquiring them. They muſt therefore be inſtinctive, like other inſtinctive antipathies and propenſities. But although in their mutual intercourſe, animals make much uſe of the ſenſe of ſmell, ſtill it does not ſeem to be further concerned in exciting their ſexual deſires, than in indicating their object.

Some of thoſe ſplenetic philoſophers, who are ready upon all occaſions to quarrel with the conſtitution of nature, have taken the liberty of condemning their Maker, becauſe it has pleaſed his unfathomable wiſdom to beſtow in ſome inſtances upon the brutes ſenſes and inſtincts more perfect than he has given to man, without reflecting that he has given to man an ample equivalent; for it may be aſked with the poet,

"Is not his reaſon all theſe powers in one?
"Is Heaven unkind to man and man alone?
"Shall he alone, whom rational we call,
"Be pleaſed with nothing if not bleſſed with all."

With reſpect to that unknown peculiarity of bodies, which is the cauſe of our ſenſations of ſmell, the opinions of philoſophers have been very various. Until of late, the doctrine of Deſcartes and Locke on this ſubject was pretty generally received; but, ſince the publication of Doctor Reid's works, his opinion, which we deem the moſt correct and ſatisfactory, has become very popular. We will endeavour to abridge his account of this matter. For this purpoſe, let us ſuppoſe a perſon, who has grown up without the ſenſe of ſmell, to be immediately endowed with the uſe of this organ, and placed near ſome flowers of an exquiſite favour. When he examines what he feels in ſuch a ſituation, he can find no reſemblance between this new ſenſation and any thing with which he is already acquainted. He finds himſelf unable to explain its nature, and cannot aſcribe to it figure, extenſion, or any known property of matter. It is a ſimple affection, or feeling, of mind, and, conſidered abſtractedly, can have no neceſſary connection with the nerves, the noſtrils, or effluvia, or with any thing material whatever. By the nature of his conſtitution he is, however, led to refer this peculiar ſenſation to the noſtrils, as its organ; and when, from experience, and by means of touch, he learns that external objects have the power of exciting this ſenſation, he concludes, that there muſt exiſt in bodies ſome unknown cauſe by which it is excited. In the firſt part of this proceſs he conſiders the feeling, or ſenſation, abſtractedly. As ſuch it exiſts in the mind only; and cannot exiſt there but when the mind is conſcious of it. His conſciouſneſs ſoon enables him to diſtinguiſh different ſorts of ſmells, all of them very diſtinct from one another; but, conformably to the nature of all ſenſation, extremely ſimple. He concludes, that each of theſe muſt have a diſtinct cauſe; and finding, by experience, that this cauſe is an unknown ſomething in bodies, he concludes, that it muſt be a property of matter, and, for want of another, gives it the name of ſmell. When he removes an odorous body from the organ, the ſenſation vaniſhes: when the body is again applied, the ſenſation is excited: and hence it is, that he is led naturally to connect the ſenſation with this unknown peculiarity of bodies by which it is produced. But ſince we ſee, that the ſenſation is, in a great degree, related to other objects beſides its unknown cauſe, to the mind in which it exiſts, for inſtance, and to the organ which is its inſtrument, it may be aſked why it becomes aſſociated in the mind with its cauſe only? The reaſon ſeems pretty obvious. No ſingle ſenſation or claſs of ſenſations, is more connected with the mind, than any others of which it is ſuſceptible. Nor is the connection ſubſiſting between the organ and any of the ſenſations peculiar to it greater than that which ſubſiſts between it and every other ſenſation of which it is the inlet. Hence the connection between the ſmell of an orange and the mind, or between it and the noſtrils, is very general, and cannot, in the former inſtance, diſtinguiſh it from any other ſenſation of whatever kind, nor, in the latter from any other particular ſmell. But the connexion between this ſenſation and the orange is peculiar and permanent; and we accordingly find them always aſſociated in the mind, juſt as we aſſociate the notion of fire with the ſenſation of burning. The relation which a ſenſation of ſmell, or any ſenſation, bears to the mind, to an organ, or to the memory and conception of itſelf, is common to all ſenſations. The relation which any ſenſation bears to its own cauſe, ſuppoſe of the ſenſation of ſmell to a particular virtue or quality of bodies, is common to it with every other ſenſation, when conſidered with reſpect to its peculiar cauſe. And finally, a ſenſation of any kind bears the ſame ſort of relation to the memory and conception of itſelf, that any other feeling or operation of mind bears to the conception and memory of that particular feeling or operation.

Whatever then be the nature of the minute particles of

Smelling.

of bodies by which our ſenſations of ſmell are excited, we cannot help conſidering their unknown cauſe as a virtue or quality of matter. Like all other modifications of material ſubſtance, it muſt be confeſſed, that this can have no reſemblance to the ſenſations of mind. But we are not, therefore, to conclude with the followers of Des Cartes and Locke, that this ſecondary quality is a mere ſenſation; eſpecially as we can readily conceive it exiſting where it is not ſmelled, or even after ſuppoſing the annihilation of every ſentient being throughout the univerſe. The exiſtence of the ſenſation we know to be momentary and fugitive; but in the exiſtence of its cauſe we can, without difficulty, or inconſiſtency, conceive a permanency independent of mind and of its ſenſations.

The doctrine we have been illuſtrating has of late been called in queſtion by a ſceptical writer, who, it appears to us, has upon this occaſion been entirely deficient in his accuſtomed acuteneſs. Dr Reid's account of this affair ſeems ſo full, ſo clear and convincing, that we are at a loſs to conceive how his meaning can be miſunderſtood; and yet the arguments and objections of the writer to whom we allude, derive all their plauſibility from a miſinterpretation of Dr Reid's meaning, and from a deviation from the eſtabliſhed uſe of language. "An eminent metaphyſician * (ſays this author) has declared that he has not the leaſt difficulty in conceiving the air perfumed with aromatic odours in the deſerts of Arabia; and he has decided, that the man who maintains ſmells to exiſt only in the mind, muſt be mad, or muſt abuſe language and diſgrace philoſophy. There are ſome authors, nevertheleſs, who differ widely on this ſubject from the learned metaphyſician. Is it poſſible for a ſenſation to exiſt where there is no ſentient? The authors to whom I allude think it impoſſible." And ſo, we may tell this learned author, does Dr Reid, if he will take his word for it. Of the ſenſation of ſmell he remarks: "It is indeed impoſſible, that it can be in any body: it is a ſenſation; and a ſenſation can be in a ſentient thing only †." Again, "I can think of the ſmell of a roſe when I do not ſmell it; and it is poſſible that when I think of it there is no roſe any where exiſting; but, when I ſmell it, I am neceſſarily determined to believe that the ſenſation really exiſts. This is common to all ſenſations, that, *as they cannot exiſt but in being perceived*, ſo they cannot be perceived but they muſt exiſt ‡." But, continues this acute metaphyſician, "a ſmell is nothing elſe than a ſenſation. It is a feeling, which may be agreeable or diſagreeable; which may, as ſome think, be excited by various combinations of elements; but which, ſince it is a feeling, cannot be thoſe elements which are ſaid to cauſe it, and cannot exiſt where there is no creature to perceive it. What is to be underſtood, in philoſophical ſtrictneſs, by the perfumes of the deſert? We can excuſe the poet when he makes the ocean ſmile *, the winds dance †, and the flowers reſpire ‡; or even were he to perfume the deſert. But the philoſopher is no ſuch magician, and had better not wander through the regions of fancy in ſearch of ſenſations where there is no ſentient." And is it then true that the word ſmell means only a ſenſation? A ſenſation is no more than an effect; it is a tranſient modification of the mind, which the mind itſelf can never produce. It muſt then have ſome cauſe which is external to the mind. Now, it is to this cauſe, and not to the ſenſation, that the name *ſmell* is moſt frequently applied in all languages; and it is this cauſe which Dr Reid ſuppoſes capable of exiſting in the deſerts of Arabia, where there is no ſentient being to perceive it. But let us hear himſelf: "We have conſidered ſmell as ſignifying a ſenſation, feeling, or impreſſion upon the mind; and in this ſenſe it can only be in a mind or ſentient being: but it is evident that mankind give the name of *ſmell* much more frequently to ſomething which they conceive to be external, and to be a quality of body; they underſtand by it ſomething which does not at all infer a mind, and have not the leaſt difficulty in conceiving the air perfumed with aromatic odours in the deſerts of Arabia, or in ſome uninhabited iſland where the human foot never trod *." "The faculty of ſmelling is ſomething very different from the actual ſenſation of ſmelling; for the faculty may remain when we have no ſenſation. And the mind is no leſs different from the faculty, for it continues the ſame individual being when that faculty is loſt. What is ſmell in the roſe? It is a quality or virtue of the roſe, or of ſomething proceeding from it, which we perceive by the ſenſe of ſmelling; and this is all we know of the matter. But what is ſmelling? It is an act of the mind, but is never imagined to be a quality of the mind. Again, the ſenſation of ſmelling is conceived to infer neceſſarily a mind or ſentient being; but ſmell in the roſe infers no ſuch thing. We ſay, this body ſmells ſweet and that ſtinks; but we do not ſay, this mind ſmells ſweet and that ſtinks; therefore, ſmell in the roſe, and the ſenſation which it cauſes, are not conceived, even by the vulgar, to be things of the ſame kind, although they have the ſame name †."

There are ſome other remarks on Dr Reid's opinions in the work upon which we have been commenting, which we ſhall paſs by; we may, however, notice the author's concluding argument: after mentioning ſome examples, he obſerves, "Now in theſe inſtances we ſee men and animals that muſt have perception of ſmell, if I may be permitted to ſay ſo, altogether different from each other. Is not ſmell ſenſation when the ſpaniel finds ſport in the field for his maſter; when the ſhark purſues through the ocean its expected victim; and when the camel conducts the thirſty wanderer to a fountain of freſh water acroſs the burning ſands of the Arabian deſert? If no animal had the ſenſation of ſmell, there would be no odour; for *aroma* and oils may be thought to be material compoſitions, but are neither agreeable nor diſagreeable feelings." If men and animals differ in their perceptions of ſmell, (and no doubt, difference of organization will cauſe them to do ſo) the concluſion ſhould not be, we think, that ſmell is merely ſenſation, but that there is actually ſomething external which is the cauſe of their ſenſations, and about which they differ. A roſe put to the noſtrils of a man and then to thoſe of a dog, may excite very different ſenſations; but we cannot think that the peculiarity of the roſe, which excites theſe different ſenſations, varies by thus changing the poſition of the roſe. If at table one perſon miſtakes mutton for beef, and another thinks that it is veniſon, the concluſion may be, that it is neither veniſon nor beef; but no man in his ſenſes can conclude that there is no meat at the table. But, "is not ſmell ſenſation when the ſpaniel finds ſport for his maſter in the field?" There is ſenſation no doubt; but we may be permitted to aſk, what would become of the ſpaniel's ſenſation of ſmell and of his maſter's ſport, were there no game in the

Smelling.

the field? What of the shark's sensation of smell and pursuit, were there no victim in the ocean? and what of the camel and the thirsty wanderer, were there no fountain of fresh water in the Arabian deserts? "The *smell of a rose* signifies two things, says Dr Reid; *First*, A sensation which can have no existence but when it is perceived, and can only be in a sentient being or mind. *Secondly*, It signifies some power, quality, or virtue in the rose, or in effluvia proceeding from it, which hath a permanent existence independent of the mind; and which, by the constitution of nature, produces the sensation in us. By the original constitution of our nature we are both led to believe that there is a permanent cause of the sensation, and prompted to seek after it; and experience determines us to place it in the rose. The names of all smells, tastes, sounds, as well as heat and cold, have a like ambiguity in all languages; but it deserves our attention, that these names are but rarely, in common language, used to signify the sensations; for the most part, they signify the external qualities which are indicated by the sensations *." We have been induced thus to discuss this topic at some length, because we regretted to see Dr Reid's opinion and reasoning misrepresented; and we shall now conclude, not as this modern Berkleian does, "that, if no animal had the sensation of smell, there would be no odour;" but, that if there were no odour or external cause of smell, no animal would have this sensation.

* [illegible] 9.

The sense of smell becomes sometimes too acute, either in consequence of some defect or disease of the organ, or from too great a sensibility of the whole nervous system, such as we sometimes observe in fevers, in phrenitis, and in hysterical diseases. It is however more frequently blunted in consequence of affections of the brain and nerves, arising from blows on the head, or from internal causes; or this may happen on account of too great a dryness of the organ, owing to a suppression of the accustomed humours, or to their being conveyed off by some other channel: or it may arise from too great a quantity of tears and of mucus choaking up the nostrils. We have instances of both in cases of common cold, in which, at the beginning of the disease, the nostrils are dry, but as it advances, begin to discharge a great deal of humour, or become obstructed by a thick mucus. Whatever hinders the free entrance of the air into the nostrils or its passage through them, must also injure the sense of smell. It is also sometimes so depraved as to perceive smells when there is no odorous body present, or to perceive smells different from those that are really present. Some of the particles of the odorous effluvia, after having remained for some time in the caverns of the nostrils, issuing forth again and affecting the organ, will sometimes cause this species of false perception, even in the most healthy persons.

The sense of smelling may be diminished or destroyed by diseases; as by the moisture, dryness, inflammation, or suppuration of the olfactory membrane, the compression of the nerves which supply it, or some fault in the brain itself at their origin. A defect, or too great a degree of solidity of the small spongy bones of the upper jaw, the caverns of the forehead, &c. may likewise impair this sense; and it may be also injured by a collection of fetid matter in these caverns, which is continually exhaling from them, and also by immoderate use of snuff. When the nose abounds with moisture, after gentle evacuations, such things as tend to take off irritation and coagulate the thin sharp serum may be applied; as the oil of anise mixed with fine flour, camphor dissolved in oil of almonds, &c. the vapours of amber, frankincense, gum-mastic, and benjamin, may likewise be received into the nose and mouth. For moistening the mucus when it is too dry, some recommend snuff made of the leaves of marjoram, mixed with oil of amber, marjoram, and aniseed; or a sternutatory of calcined white vitriol, twelve grains of which may be mixed with two ounces of marjoram water and filtrated. The steam of vinegar upon hot iron, and received up the nostrils, is also of use for softening the mucus, removing obstructions, &c. If there be an ulcer in the nose, it ought to be dressed with some emollient ointment, to which, if the pain be very great, a little laudanum may be added. If it be a venereal ulcer, 12 grains of corrosive sublimate may be dissolved in a pint and a half of brandy, a table spoonful of which may be taken twice a day. The ulcer ought likewise to be washed with it, and the fumes of cinnabar may be received up the nostrils.

Smelling || Smith.

If there be reason to suspect that the nerves which supply the organs of smelling are inert, or want stimulating, volatile salts, or strong snuffs, and other things which occasion sneezing, may be applied to the nose; the forehead may likewise be anointed with balsam of Peru, to which may be added a little oil of amber.

SMITH, SIR THOMAS, was born at Walden in Essex in 1512. At 14 he was sent to Queen's college Cambridge, where he distinguished himself so much, that he was made Henry VIII.'s scholar together with John Cheke. He was chosen a fellow of his college in 1531, and appointed two years after to read the public Greek lecture. The common mode of reading Greek at that time was very faulty; the same sound being given to the letters and diphthongs, ι, η, υ, ει, οι, υι. Mr Smith and Mr Cheke had been for some time sensible that this pronunciation was wrong: and after a good deal of consultation and research, they agreed to introduce that mode of reading which prevails at present. Mr Smith was lecturing on *Aristotle de Republica* in Greek. At first he dropped a word or two at intervals in the new pronunciation, and sometimes he would stop as if he had committed a mistake and correct himself. No notice was taken of this for two or three days; but as he repeated more frequently, his audience began to wonder at the unusual sounds, and at last some of his friends mentioned to him what they had remarked. He owned that something was in agitation, but that it was not yet sufficiently digested to be made public. They entreated him earnestly to discover his project: he did so; and in a short time great numbers resorted to him for information. The new pronunciation

was

Smith.

was adopted with enthuſiaſm, and ſoon became univerſal at Cambridge. It was afterwards oppoſed by Biſhop Gardiner the chancellor; but its ſuperiority to the old mode was ſo viſible, that in a few years it ſpread over all England.

In 1539 he travelled into foreign countries, and ſtudied for ſome time in the univerſities of France and Italy. On his return he was made regius profeſſor of civil law at Cambridge. About this time he publiſhed a treatiſe on the mode of pronouncing Engliſh. He was uſeful likewiſe in promoting the reformation. Having gone into the family of the duke of Somerſet, the protector during the minority of Edward VI. he was employed by that nobleman in public affairs; and in 1548 was made ſecretary of ſtate, and received the honour of knighthood. While that nobleman continued in office, he was ſent ambaſſador, firſt to Bruſſels and afterwards to France.

Upon Mary's acceſſion he loſt all his places, but was fortunate enough to preſerve the friendſhip of Gardiner and Bonner. He was exempted from perſecution, and was allowed, probably by their influence, a penſion of 100 l. During Elizabeth's reign he was employed in public affairs, and was ſent three times by that princeſs as her ambaſſador to France. He died in 1577. His abilities were excellent, and his attainments uncommonly great: He was a philoſopher, a phyſician, a chemiſt, mathematician, linguiſt, hiſtorian, and architect. He wrote, 1. A treatiſe called the *Engliſh Commonwealth*. 2. A letter *De Recta et Emendata Linguæ Græcæ Pronunciatione*. 3. *De Moribus Turcarum*. 4. *De Druidum Moribus*.

SMITH, *Edmund*, an Engliſh poet, the only ſon of Mr Neale an eminent merchant, by a daughter of Baron Lechmere, was born in 1668. By his father's death he was left young to the care of Mr Smith, who had married his father's ſiſter, and who treated him with ſo much tenderneſs, that at the death of his generous guardian he aſſumed his name. His writings are not many, and thoſe are ſcattered about in miſcellanies and collections: his celebrated tragedy of Phædra and Hippolitus was acted in 1707; and being introduced at a time when the Italian opera ſo much engroſſed the polite world, gave Mr Addiſon, who wrote the prologue, an opportunity to rally the vitiated taſte of the public. However, notwithſtanding the eſteem it has always been held in, it is perhaps rather to be conſidered as a fine poem than as a good play. This tragedy, with a Poem to the memory of Mr John Philips, three or four Odes, with a Latin oration ſpoken at Oxford *in laudem Thomæ Bodleii*, were publiſhed as his works by his friend Mr Oldiſworth. Mr Smith died in 1710, ſunk into indolence and intemperance by poverty and diſappointments; the hard fate of many a man of genius.

SMITH, *John*, an excellent mezzotinter, flouriſhed about 1700; but neither the time of his birth nor death is accurately known. He united ſoftneſs with ſtrength, and finiſhed with freedom. He ſerved his time with one Tillet a painter in Moorfields; and as ſoon as he became his own maſter, learned from Becket the ſecret of mezzotinto, and being farther inſtructed by Van der Vaart, was taken to work in Sir Godfrey Kneller's houſe; and as he was to be the publiſher of that maſter's works, doubtleſs received conſiderable hints from him, which he amply repaid. "To poſterity perhaps his prints (ſays Mr Walpole) will carry an idea of ſomething burleſque; perukes of an enormous length flowing over ſuits of armour, compoſe wonderful habits. It is equally ſtrange that faſhion could introduce the one, and eſtabliſh the practice of repreſenting the other when it was out of faſhion. Smith excelled in exhibiting both, as he found them in the portraits of Kneller, who was leſs happy in what he ſubſtituted to armour. In the Kit-cat club he has poured full bottoms chiefly over night gowns. If thoſe ſtreams of hair were *incommode* in a battle, I know nothing (he adds) they were adapted to that can be done in a night-gown. Smith compoſed two large volumes, with proofs of his own plates, for which he aſked 50l. His fineſt works are Duke Schomberg on horſeback; that duke's ſon and ſucceſſor Maynhard: the earls of Pembroke, Dorſet, and Albemarle; three plates with two figures in each, of young perſons or children, in which he ſhone; William Cowper; Gibbons and his wife; Queen Anne; the duke of Glouceſter, a whole length, with a flower-pot; a very curious one of Queen Mary, in a high head, fan, and gloves; the earl of Godolphin; the ducheſs of Ormond, a whole length, with a black; Sir George Rooke, &c. There is a print by him of James II. with an anchor, but no inſcription; which not being finiſhed when the king went away, is ſo ſcarce that it is ſometimes ſold for above a guinea. Smith alſo performed many hiſtoric pieces; as the loves of the gods, from Titian, at Blenheim, in ten plates; Venus ſtanding in a ſhell, from a picture by Corregio, and many more, of which perhaps the moſt delicate is the holy family with angels, after Carlo Maratti." *Walpole's Catalogue of Engravers.*

SMITH, *Dr Adam*, the celebrated author of the Inquiry into the Nature and Cauſes of the Wealth of Nations, was the only ſon of Adam Smith comptroller of the cuſtoms at Kirkaldy, and of Margaret Douglas daughter of Mr Douglas of Strathenry. He was born at Kirkaldy on the 5th June 1723, a few months after the death of his father. His conſtitution during his infancy was infirm and ſickly, and required all the care of his ſurviving parent. When only three years old he was carried by his mother to Strathenry on a viſit to his uncle Mr Douglas; and happening one day to be amuſing himſelf alone at the door of the houſe, he was ſtolen by a party of thoſe vagrants who in Scotland are called *tinkers*. Luckily he was miſſed immediately, and the vagrants purſued and overtaken in Leſlie wood; and thus Dr Smith was preſerved to extend the bounds of ſcience, and reform the commercial policy of Europe. *Philoſophical Tranſactions of the Royal Society of Edinburgh, vol. iii.*

He received the rudiments of his education in the ſchool of Kirkaldy under David Miller, a teacher of conſiderable eminence, and whoſe name deſerves to be recorded on account of the great number of eminent men which that ſeminary produced while under his direction. Dr Smith, even while at ſchool, attracted notice by his paſſionate attachment to books, and by the extraordinary powers of his memory; while his friendly and generous diſpoſition gained and ſecured the affection of his ſchoolfellows. Even then he was remarkable for thoſe habits which remained with him through life, of ſpeaking to himſelf when alone and of abſence in company. He was ſent in 1737 to the univerſity of Glaſgow, where he remained till 1740, when he went

to

Smith.

to Balliol college Oxford, as an exhibitioner on Snell's foundation. His favourite pursuits while at the university were mathematics and natural philosophy. After his removal to England he frequently employed himself in translating, particularly from the French, with a view to the improvement of his own style: a practice which he often recommended to all who wished to cultivate the art of composition. It was probably then also that he applied himself with the greatest care to the study of languages, of which, both ancient and modern, his knowledge was uncommonly extensive and accurate.

After seven years residence at Oxford he returned to Kirkaldy, and lived two years with his mother without any fixed plan for his future life. He had been designed for the church of England; but disliking the ecclesiastical profession, he resolved to abandon it altogether, and to limit his ambition to the prospect of obtaining some of those preferments to which literary attainments lead in Scotland. In 1748 he fixed his residence in Edinburgh, and for three years read a course of lectures on rhetoric and belles lettres under the patronage of Lord Kames. In 1751 he was elected professor of logic in the university of Glasgow, and the year following was removed to the professorship of moral philosophy, vacant by the death of Mr Thomas Cragie, the immediate successor of Dr Hutcheson. In this situation he remained 13 years, a period he used frequently to look back to as the most useful part of his life. His lectures on moral philosophy were divided into four parts: The first contained natural theology; in which he considered the proofs of the being and attributes of God, and those truths on which religion is founded: the second comprehended ethics, strictly so called, and consisted chiefly of those doctrines which he afterwards published in his theory of moral sentiments: in the third part he treated more at length of that part of morality called *justice;* and which, being susceptible of precise and accurate rules, is for that reason capable of a full and accurate explanation: in the last part of his lectures he examined those political regulations which are founded, not upon the principle of justice, but of expediency; and which are calculated to increase the riches, the power, and the prosperity of a state. Under this view he considered the political institutions relating to commerce, to finances, to ecclesiastical and military governments: this contained the substance of his *Wealth of Nations*. In delivering his lectures he trusted almost entirely to extemporary elocution: his manner was plain and unaffected, and he never failed to interest his hearers. His reputation soon rose very high, and many students resorted to the university merely upon his account.

When his acquaintance with Mr Hume first commenced is uncertain; but it had ripened into friendship before the year 1752.

In 1759 he published his Theory of Moral Sentiments; a work which deservedly extended his reputation: for, though several of its conclusions be ill-founded, it must be allowed by all to be a singular effort of invention, ingenuity, and subtilty. Besides, it contains a great mixture of important truth; and, though the author has sometimes been misled, he has had the merit of directing the attention of philosophers to a view of human nature, which had formerly in a great measure escaped their notice. It abounds everywhere with the purest and most elevated maxims concerning the practical conduct of life; and when the subject of his work leads him to address the imagination and the heart, the variety and felicity of his illustrations, the richness and fluency of his eloquence, and the skill with which he wins the attention and commands the passions of his readers, leave him among our British moralists without a rival.

Towards the end of 1763 Dr Smith received an invitation from Mr Charles Townsend to accompany the duke of Buccleugh on his travels; and the liberal terms in which this proposal was made induced him to resign his office at Glasgow. He joined the duke of Buccleugh at London early in the year 1764, and set out with him for the continent in the month of March following. After a stay of about ten days at Paris, they proceeded to Thoulouse, where they fixed their residence for about 18 months; thence they went by a pretty extensive route through the south of France to Geneva, where they passed two months. About Christmas 1765 they returned to Paris, and remained there till October following. The society in which Dr Smith passed these ten months may be conceived in consequence of the recommendation of Mr Hume. Turgot, Quesnai, Necker, d'Alembert, Helvetius, Marmontel, Madame Riccoboni, were among the number of his acquaintances; and some of them he continued ever after to reckon among the number of his friends. In October 1766 the duke of Buccleugh returned to England.

Dr Smith spent the next ten years of his life with his mother at Kirkaldy, occupied habitually in intense study, but unbending his mind at times in the company of some of his old schoolfellows, who still continued to reside near the place of their birth. In 1776 he published his *Inquiry into the Nature and Causes of the Wealth of Nations;* a book so universally known, that any panegyric on it would be useless. The variety, importance, and (may we not add) novelty, of the information which it contains; the skill and comprehensiveness of mind displayed in the arrangement; the admirable illustrations with which it abounds; together with a plainness and perspicuity which makes it intelligible to all—render it unquestionably the most perfect work which has yet appeared on the general principles of any branch of legislation.

He spent the next two years of his life in London, where he enjoyed the society of some of the most eminent men of the age: but he removed to Edinburgh in 1778, in consequence of having been appointed, at the request of the duke of Buccleugh, one of the commissioners of the customs in Scotland. Here he spent the last twelve years of his life in an affluence which was more than equal to all his wants. But his studies seemed entirely suspended till the infirmities of old age reminded him, when it was too late, of what he yet owed to the public and to his own fame. The principal materials of the works which he had announced had long ago been collected, and little probably was wanting but a few years of health and retirement to complete them. The death of his mother, who had accompanied him to Edinburgh in 1784, together with that of his cousin Miss Douglas in 1788, contributed to frustrate these projects. They had been the objects of his affection for

Smith || Smoke.

for more than 60 years, and in their ſocieties he had enjoyed from his infancy all that he ever knew of the endearments of a family. He was now alone and helpleſs; and though he bore his loſs with equanimity, and regained apparently his former cheerfulneſs, yet his health and ſtrength gradually declined till the period of his death, which happened in July 1790. Some days before his death he ordered all his papers to be burnt except a few eſſays, which have ſince been publiſhed.

Of the originality and comprehenſiveneſs of his views; the extent, the variety, and the correctneſs of his information; the inexhauſtible fertility of his invention—he has left behind him laſting monuments. To his private worth, the moſt certain of all teſtimonies may be found in that confidence, reſpect, and attachment, which followed him through all the various relations of life. He was habitually abſent in converſation, and was apt when he ſpoke to deliver his ideas in the form of a lecture. He was rarely known to ſtart a new topic himſelf, or to appear unprepared upon thoſe topics that were introduced by others. In his external form and appearance there was nothing uncommon. When perfectly at eaſe, and when warmed with converſation, his geſtures were animated and not ungraceful; and in the ſociety of thoſe he loved, his features were often brightened by a ſmile of inexpreſſible benignity. In the company of ſtrangers, his tendency to abſence, and perhaps ſtill more his conſciouſneſs of that tendency, rendered his manners ſomewhat embarraſſed: an effect which was probably not a little heightened by thoſe ſpeculative ideas of propriety which his recluſe habits tended at once to perfect in his conception, and to diminiſh his power of realizing.

SMITHIA, a genus of plants belonging to the *diadelphia* claſs; and in the natural method ranking under the 32d order, *Papilionaceæ*. See BOTANY *Index*.

SMITHERY, a ſmith's ſhop; alſo the art of a ſmith, by which iron is wrought into any ſhape by means of fire, hammering, filing, &c.

SMITING-LINE, in a ſhip, is a ſmall rope faſtened to the mizen-yard arm, below at the deck, and is always furled up with the mizen-ſail, even to the upper end of the yard, and thence it comes down to the poop. Its uſe is to looſe the mizen-ſail without ſtriking down the yard, which is eaſily done, becauſe the mizen-ſail is furled up only with rope-yarns; and therefore when this rope is pulled hard, it breaks all the rope-yarns, and ſo the ſail falls down of itſelf. The ſailor's phraſe is, *ſmite the mizen* (whence this rope takes its name), that is, hale by this rope that the ſail may fall down.

SMOKE, a denſe elaſtic vapour, ariſing from burning bodies. As this vapour is extremely diſagreeable to the ſenſes, and often prejudicial to the health, mankind have fallen upon ſeveral contrivances to enjoy the benefit of fire, without being annoyed by ſmoke. The moſt univerſal of theſe contrivances is a tube leading from the chamber in which the fire is kindled to the top of the building, through which the ſmoke aſcends, and is diſperſed into the atmoſphere. Theſe tubes are called *chimneys*; which, when conſtructed in a proper manner, carry off the ſmoke entirely; but, when improperly conſtructed, they carry off the ſmoke imperfectly, to the great annoyance of the inhabitants. As our maſons at preſent ſeem to have a very imperfect knowledge of the manner in which chimneys ought to be built, we can hardly perform a more acceptable ſervice to the public than to point out the manner in which they ought to be conſtructed, ſo as to carry off the ſmoke entirely; as well as to explain the cauſes from which the defects ſo often complained of generally proceed, and the method of removing them.

Smoke.

Tranſactions of the American Philoſophical Society.

Thoſe who would be acquainted with this ſubject, ſhould begin by conſidering on what principle ſmoke aſcends in any chimney. At firſt many are apt to think that ſmoke is in its nature, and of itſelf, ſpecifically lighter than air, and riſes in it for the ſame reaſon that cork riſes in water. Theſe ſee no cauſe why ſmoke ſhould not riſe in the chimney though the room be ever ſo cloſe. Others think there is a power in chimneys to *draw* up the ſmoke, and that there are different forms of chimneys which afford more or leſs of this power. Theſe amuſe themſelves with ſearching for the beſt form. The equal dimenſions of a funnel in its whole length is not thought artificial enough, and it is made, for fancied reaſons, ſometimes tapering and narrowing from below upwards, and ſometimes the contrary, &c. &c. A ſimple experiment or two may ſerve to give more correct ideas. Having lighted a pipe of tobacco, plunge the ſtem to the bottom of a decanter half filled with cold water; then putting a rag over the bowl, blow through it, and make the ſmoke deſcend in the ſtem of the pipe, from the end of which it will riſe in bubbles through the water; and being thus cooled, will not afterwards riſe to go out through the neck of the decanter, but remain ſpreading itſelf and reſting on the ſurface of the water. This ſhows that ſmoke is really heavier than air, and that it is carried upwards only when attached to or acted upon by air that is heated, and thereby rarefied and rendered ſpecifically lighter than the air in its neighbourhood.

Smoke being rarely ſeen but in company with heated air, and its upward motion being viſible, though that of the rarefied air that drives it is not ſo, has naturally given riſe to the error. It is now well known that air is a fluid which has weight as well as others, though about 800 times lighter than water; that heat makes the particles of air recede from each other, and take up more ſpace, ſo that the ſame weight of air heated will have more bulk than equal weights of cold air which may ſurround it, and in that caſe muſt riſe, being forced upwards by ſuch colder and heavier air, which preſſes to get under it and take its place. That air is ſo rarefied or expanded by heat, may be proved to their comprehenſion by a lank blown bladder, which laid before a fire, will ſoon ſwell, grow tight, and burſt.

Another experiment may be to take a glaſs tube about an inch in diameter, and 12 inches long, open at both ends, and fixed upright on legs ſo that it need not be handled, for the hands might warm it. At the end of a quill faſten five or ſix inches of the fineſt light filament of ſilk, ſo that it may be held either above the upper end of the tube or under the lower end, your warm hand being at a diſtance by the length of the quill. If there were any motion of air through the tube, it would manifeſt itſelf by its effect on the ſilk; but if the tube and the air in it are of the ſame temperature with the ſurrounding air, there will be no ſuch motion, whatever may be the form of the tube, whether crooked or ſtraight, narrow below and widening up-

Plate cccclxxvii.

wards, or the contrary, the air in it will be quiefcent. Warm the tube, and you will find as long as it continues warm, a conftant current of air entering below and paffing up through it till difcharged at the top; becaufe the warmth of the tube being communicated to the air it contains, rarefies that air, and makes it lighter than the air without; which therefore preffes in below, forces it upwards, follows and takes its place, and is rarefied in its turn. And, without warming the tube, if you hold under it a knob of hot iron, the air thereby heated will rife and fill the tube, going out at its top; and this motion in the tube will continue as long as the knob remains hot, becaufe the air entering the tube below, is heated and rarefied by paffing near and over that knob.

That this motion is produced merely by the difference of fpecific gravity between the fluid within and that without the tube, and not by any fancied form of the tube itfelf, may appear by plunging it into water contained in a glafs jar a foot deep, through which fuch motion might be feen. The water within and without the tube being of the fame fpecific gravity, balance each other, and both remain at reft. But take out the tube, ftop its bottom with a finger, and fill it with olive oil, which is lighter than water; then ftopping the top, place it as before, its lower end under water, its top a very little above. As long as you keep the bottom ftopped the fluids remain at reft; but the moment it is unftopt, the heavier enters below, forces up the lighter, and takes its place: and the motion then ceafes, merely becaufe the new fluid cannot be fucceffively made lighter, as air may be by a warm tube.

In fact, no form of the funnel of a chimney has any fhare in its operation or effect refpecting fmoke except its height. The longer the funnel, if erect, the greater its force when filled with heated and rarefied air to draw in below and drive up the fmoke, if one may, in compliance with cuftom, ufe the expreffion *draw*, when in fact it is the fuperior weight of the furrounding atmofphere that preffed to enter the funnel below, and fo drives up before it the fmoke and warm air it meets with in its paffage.

What is it then which makes a fmoky chimney, that is, a chimney which, inftead of conveying up all the fmoke, difcharges a part of it into the room, offending the eyes and damaging the furniture?

The caufes of this effect may be reduced to *nine*, differing from each other, and therefore requiring different remedies.

1. *Smoky chimneys in a new houfe are fuch frequently from mere want of air.* The workmanfhip of the rooms being all good, and juft out of the workman's hands, the joints of the boards of the flooring, and of the pannels of wainfcotting, are all true and tight; the more fo as the walls, perhaps not yet thoroughly dry, preferve a dampnefs in the air of the room which keeps the woodwork fwelled and clofe. The doors and the fafhes too, being worked with truth, fhut with exactnefs, fo that the room is as tight as a fnuff-box, no paffage being left open for air to enter except the key-hole, and even that is fometimes covered by a little dropping fhutter. Now if fmoke cannot rife but as connected with rarefied air, and a column of fuch air, fuppofe it filling the funnel, cannot rife unlefs other air be admitted to fupply its place; and if therefore no current of air enter the opening of the chimney—there is nothing to prevent the fmoke from coming out into the room. If the motion upwards of the air in a chimney that is freely fupplied be obferved by the rifing of the fmoke or a feather in it, and it be confidered that in the time fuch feather takes in rifing from the fire to the top of the chimney, a column of air equal to the content of the funnel muft be difcharged, and an equal quantity fupplied from the room below, it will appear abfolutely impoffible that this operation fhould go on if the tight room is kept fhut; for were there any force capable of drawing conftantly fo much air out of it, it muft foon be exhaufted like the receiver of an air-pump, and no animal could live in it. Thofe therefore who ftop every crevice in a room to prevent the admiffion of frefh air, and yet would have their chimney carry up the fmoke, require inconfiftencies, and expect impoffibilities. Yet under this fituation it is not uncommon to fee the owner of a new houfe in defpair, and ready to fell it for much lefs than it coft; conceiving it uninhabitable becaufe not a chimney in any one of its rooms will carry off the fmoke unlefs a door or window be left open. Much expence has alfo been made to alter and amend new chimneys which had really no fault: in one houfe particularly which Dr Franklin knew that belonged to a nobleman in Weftminfter, that expence amounted to no lefs than 300l. after his houfe had been, as he thought, finifhed and all charges paid. And after all, feveral of the alterations were ineffectual, for want of underftanding the true principles.

Remedies. When you find on trial that opening the door or a window enables the chimney to carry up all the fmoke, you may be fure that want of air from without was the caufe of its fmoking. "I fay from *without* (adds Dr Franklin), to guard you againft a common miftake of thofe who may tell you the room is large, contains abundance of air fufficient to fupply any chimney, and therefore it cannot be that the chimney wants air. Thefe reafoners are ignorant that the largenefs of a room, if tight, is in this cafe of fmall importance, fince it cannot part with a chimneyfull of its air without occafioning fo much vacuum; which it requires a great force to effect, and could not be borne if effected."

It appearing plainly then, that fome of the outward air muft be admitted, the queftion will be, how much is abfolutely neceffary? for you would avoid admitting more, as being contrary to one of your intentions in having a fire, viz. that of warming your room. To difcover this quantity, fhut the door gradually while a middling fire is burning, till you find that before it is quite fhut the fmoke begins to come out into the room; then open it a little till you perceive the fmoke comes out no longer. There hold the door, and obferve the width of the open crevice between the edge of the door and the rabbet it fhould fhut into. Suppofe the diftance to be half an inch, and the door eight feet high; you find thence that your room requires an entrance for air equal in area to 96 half inches, or 48 fquare inches, or a paffage of 6 inches by 8. This, however, is a large fuppofition; there being few chimneys that, having a moderate opening and a tolerable height of funnel, will not be fatisfied with fuch a crevice of a quarter of an inch: Dr Franklin found a fquare of 6 by 6, or 36 fquare inches, to be pretty good medium that

Smoke.

that will ferve for moft chimneys. High funnels with fmall and low openings may indeed be fupplied through a lefs fpace; becaufe, for reafons that will appear hereafter, the force of levity, if one may fo fpeak, being greater in fuch funnels, the cool air enters the room with greater velocity, and confequently more enters in the fame time. This, however, has its limits; for experience fhows, that no increafed velocity fo occafioned has made the admiffion of air through the key-hole equal in quantity to that through an open door, though through the door the current moves flowly, and through the key-hole with great rapidity.

It remains then to be confidered, how and where this neceffary quantity of air from without is to be admitted fo as to be leaft inconvenient: for if at the door, left fo much open, the air thence proceeds directly to the chimney, and in its way comes cold to your back and heels as you fit before your fire. If you keep the door fhut, and raife a little the fafh of your window, you feel the fame inconvenience. Various have been the contrivances to avoid this; fuch as bringing in frefh air through pipes in the jams of the chimney, which pointing upwards fhould blow the fmoke up the funnel; opening paffages into the funnel above, to let in air for the fame purpofe. But thefe produce an effect contrary to that intended: for as it is the conftant current of air paffing from the room through the opening of the chimney into the funnel which prevents the fmoke from coming out into the room, if you fupply the funnel by other means or in other ways with the air which it wants, and efpecially if that air be cold, you diminifh the force of that current, and the fmoke in its efforts to enter the room finds lefs refiftance.

The wanted air muft then indifpenfably be admitted into the room, to fupply what goes off through the opening of the chimney. M. Gauger, a very ingenious and intelligent French writer on the fubject, propofes with judgement to admit it above the opening of the chimney; and to prevent inconvenience from its coldnefs, he directs that it may be fo made, that it fhall pafs in its entrance through winding cavities made behind the iron back and fides of the fire-place, and under the iron hearth-plate; in which cavities it will be warmed, and even heated, fo as to contribute much, inftead of cooling, to the warming of the room. This invention is excellent in itfelf, and may be ufed with advantage in building new houfes; becaufe the chimneys may then be fo difpofed as to admit conveniently the cold air to enter fuch paffages: but in houfes built without fuch views, the chimneys are often fo fituated as not to afford that convenience without great and expenfive alterations. Eafy and cheap methods, though not quite fo perfect in themfelves, are of more general utility; and fuch are the following.

In all rooms where there is a fire, the body of air warmed and rarefied before the chimney is continually changing place, and making room for other air that is to be warmed in its turn. Part of it enters and goes up the chimney, and the reft rifes and takes place near the ceiling. If the room be lofty, that warm air remains above our heads as long as it continues warm, and we are little benefited by it, becaufe it does not defcend till it is cooler. Few can imagine the difference of climate between the upper and lower parts of fuch a room, who have not tried it by the thermometer, or by going up a ladder till their heads are near the ceiling. It is then among this warm air that the wanted quantity of outward air is beft admitted, with which being mixed, its coldnefs is abated, and its inconvenience diminifhed fo as to become fcarce obfervable. This may be eafily done by drawing down about an inch the upper fafh of a window; or, if not moveable, by cutting fuch a crevice through its frame; in both which cafes it will be well to place a thin fhelf of the length to conceal the opening, and floping upwards, to direct the entering air horizontally along and under the ceiling. In fome houfes the air may be admitted by fuch a crevice made in the wainfcot, cornice, or plaftering, near the ceiling and over the opening of the chimney. This, if practicable, is to be chofen, becaufe the entering cold air will there meet with the warmeft rifing air from before the fire, and be fooneft tempered by the mixture. The fame kind of fhelf fhould alfo be placed here. Another way, and not a very difficult one, is to take out an upper pane of glafs in one of your fafhes, fet it in a tin frame, giving it two fpringing angular fides, and then replacing it, with hinges below on which it may be turned to open more or lefs above. It will then have the appearance of an internal fky-light. By drawing this pane in, more or lefs, you may admit what air you find neceffary. Its pofition will naturally throw that air up and along the ceiling. This is what is called in France a *Was ift das?* As this is a German queftion, the invention is probably of that nation, and takes its name from the frequent afking of that queftion when it firft appeared. In England fome have of late years cut a round hole about five inches diameter in a pane of the fafh and placed againft it a circular plate of tin hung on an axis, and cut into vanes; which, being feparately bent a little obliquely, are acted upon by the entering air, fo as to force the plate continually round like the vanes of a windmill. This admits the outward air, and by the continual whirling of the vanes, does in fome degree difperfe it. The noife only is a little inconvenient.

Fig. 2.

2. A fecond caufe of the fmoking of chimneys is, *their openings in the room being too large*; that is, too wide, too high, or both. Architects in general have no other ideas of proportion in the opening of a chimney than what relate to fymmetry and beauty refpecting the dimenfions of the room; while its true proportion refpecting its function and utility depends on quite other principles; and they might as properly proportion the ftep in a ftaircafe to the height of the ftory, inftead of the natural elevation of men's legs in mounting. The proportion then to be regarded, is what relates to the height of the funnel. For as the funnels in the different ftories of a houfe are neceffarily of different heights or lengths, that from the loweft floor being the higheft or longeft, and thofe of the other floors fhorter and fhorter, till we come to thofe in the garrets, which are of courfe the fhorteft; and the force of draft being, as already faid, in proportion to the height of funnel filled with rarefied air, and a current of air from the room into the chimney, fufficient to fill the opening, being neceffary to oppofe and prevent the fmoke from coming out into the room; it follows, that the openings of the longeft funnels may be larger, and that thofe of the fhorter funnels fhould be fmaller. For if there be a large opening to a chimney that does not draw ftrongly, the funnel may

may happen to be furnifhed with the air which it demands by a partial current entering on one fide of the opening, and leaving the other fide free of any oppofing current, may permit the fmoke to iffue there into the room. Much too of the force of draft in a funnel depends on the degree of rarefaction in the air it contains, and that depends on the nearnefs to the fire of its paffage in entering the funnel. If it can enter far from the fire on each fide, or far above the fire, in a wide or high opening, it receives little heat in paffing by the fire, and the contents of the funnel are by thofe means lefs different in levity from the furrounding atmofphere, and its force in drawing confequently weaker. Hence if too large an opening be given to chimneys in upper rooms, thofe rooms will be fmoky: On the other hand, if too fmall openings be given to chimneys in the lower rooms, the entering air operating too directly and violently on the fire, and afterwards ftrengthening the draft as it afcends the funnel, will confume the fuel too rapidly.

Remedy. As different circumftances frequently mix themfelves in thefe matters, it is difficult to give precife dimenfions for the openings of all chimneys. Our fathers made them generally much too large: we have leffened them; but they are often ftill of greater dimenfions than they fhould be, the human eye not being eafily reconciled to fudden and great changes. If you fufpect that your chimney fmokes from the too great dimenfion of its opening, contract it by placing moveable boards fo as to lower and narrow it gradually till you find the fmoke no longer iffues into the room. The proportion fo found will be that which is proper for that chimney, and you may employ the bricklayer or mafon to reduce it accordingly. However, as in building new houfes fomething muft be fometimes hazarded, Dr Franklin propofes to make the openings in the lower rooms about 30 inches fquare and 18 deep, and thofe in the upper only 18 inches fquare and not quite fo deep; the intermediate ones diminifhing in proportion as the height of the funnel is diminifhed. In the larger openings, billets of two feet long, or half the common length of cordwood, may be burnt conveniently; and for the fmaller, fuch wood may be fawed into thirds. Where coals are the fuel, the grates will be proportioned to the openings. The fame depth is nearly neceffary to all, the funnels being all made of a fize proper to admit a chimney-fweeper. If in large and elegant rooms cuftom or fancy fhould require the appearance of a larger chimney, it may be formed of expenfive marginal decorations, in marble, &c. But in time perhaps, that which is fitteft in the nature of things may come to be thought handfomeft.

3. Another caufe of fmoky chimneys is *too fhort a funnel.* This happens neceffarily in fome cafes, as where a chimney is required in a low building; for, if the funnel be raifed high above the roof, in order to ftrengthen its draft, it is then in danger of being blown down, and crufhing the roof in its fall.

Remedies. Contract the opening of the chimney, fo as to oblige all the entering air to pafs through or very near the fire; whereby it will be more heated and rarefied, the funnel itfelf be more warmed, and its contents have more of what may be called the force of levity, fo as to rife ftrongly and maintain a good draft at the opening.

Or you may in fome cafes, to advantage, build additional ftories over the low building, which will fupport a high funnel.

If the low building be ufed as a kitchen, and a contraction of the opening therefore inconvenient, a large one being neceffary, at leaft when there are great dinners, for the free management of fo many cooking utenfils; in fuch cafe the beft expedient perhaps would be to build two more funnels joining to the firft, and having three moderate openings, one to each funnel, inftead of one large one. When there is occafion to ufe but one, the other two may be kept fhut by fliding plates, hereafter to be defcribed; and two or all of them may be ufed together when wanted. This will indeed be an expence, but not an ufelefs one, fince your cooks will work with more comfort, fee better than in a fmoky kitchen what they are about, your victuals will be cleaner dreffed and not tafte of fmoke, as is often the cafe; and to render the effect more certain, a ftack of three funnels may be fafely built higher above the roof than a fingle funnel.

The cafe of too fhort a funnel is more general than would be imagined, and often found where one would not expect it. For it is not uncommon, in ill-contrived buildings, inftead of having a funnel for each room or fire-place, to bend and turn the funnel of an upper room fo as to make it enter the fide of another funnel that comes from below. By thefe means the upper room funnel is made fhort of courfe, fince its length can only be reckoned from the place where it enters the lower room funnel; and that funnel is alfo fhortened by all the diftance between the entrance of the fecond funnel and the top of the ftack: for all that part being readily fupplied with air through the fecond funnel, adds no ftrength to the draft, efpecially as that air is cold when there is no fire in the fecond chimney. The only eafy remedy here is, to keep the opening of that funnel fhut in which there is no fire.

4. Another very common caufe of the fmoking of chimneys is, *their overpowering one another.* For inftance, if there be two chimneys in one large room, and you make fires in both of them, the doors and windows clofe fhut, you will find that the greater and ftronger fire fhall overpower the weaker, from the funnel of which it will draw air down to fupply its own demand; which air defcending in the weaker funnel, will drive down its fmoke, and force it into the room. If, inftead of being in one room, the two chimneys are in two different rooms, communicating by a door, the cafe is the fame whenever that door is open. In a very tight houfe, a kitchen chimney on the loweft floor, when it had a great fire in it, has been known to overpower any other chimney in the houfe, and draw air and fmoke into its room as often as the door communicating with the ftaircafe was opened.

Remedy. Take care that every room have the means of fupplying itfelf from without with the air which its chimney may require, fo that no one of them may be obliged to borrow from another, nor under the neceffity of lending. A variety of thefe means have been already defcribed.

5. Another caufe of fmoking is, *when the tops of chimneys are commanded by higher buildings, or by a hill,* fo that the wind blowing over fuch eminences falls like water over a dam, fometimes almoft perpendicularly on the

Smoke. the tops of the chimneys that lie in its way, and beats down the ſmoke contained in them.

Fig. 3. To illuſtrate this, let A (fig. 3.) repreſent a ſmall building at the ſide of a great rock B, and the wind coming in the direction CD; when the current of air comes to the point D, being hurried forward with great velocity, it goes a little forward, but ſoon deſcends downward, and gradually is reflected more and more inward, as repreſented by the dotted lines EE, &c. ſo that, deſcending downwards upon the top of the chimney A, the ſmoke is beat back again into the apartments.

It is evident that houſes ſituated near high hills or thick woods will be in ſome meaſure expoſed to the ſame inconvenience; but it is likewiſe plain, that if a houſe be ſituated upon the ſlope of a hill (as at F, fig. 3.), it will not be in any danger of ſmoke when the wind blows towards that ſide of the hill upon which it is ſituated; for the current of air coming over the houſe-top in the direction GH, is immediately changed by the ſlope of the hill to the direction HC, which powerfully draws the ſmoke upward from the top of the chimney. But it is alſo evident, that a houſe in this ſituation will be liable to ſmoke when the wind blows from the hill; for the current of air coming downward in the direction CH, will beat downward on the chimney F, and prevent the ſmoke from aſcending with freedom. The effect will be much heightened if the doors and windows are chiefly in the lowermoſt ſide of the houſe.

Remedy. That commonly applied to this caſe is a turncap made of tin or plate iron, covering the chimney above and on three ſides, open on one ſide, turning on a ſpindle; and which being guided or governed by a vane always preſents its back to the current. This may be generally effectual, though not certain, as there may be caſes in which it will not ſucceed. Raiſing your funnels if practicable, ſo as their tops may be higher, or at leaſt equal, with the commanding eminence, is more to be depended on. But the turning cap, being eaſier and cheaper, ſhould firſt be tried. "If obliged to build in ſuch a ſituation, I would chooſe (ſays Dr Franklin) to place my doors on the ſide next the hill, and the backs of my chimneys on the fartheſt ſide; for then the column of air falling over the eminence, and of courſe preſſing on that below, and forcing it to enter the doors or *was-iſt-das*es on that ſide, would tend to balance the preſſure down the chimneys, and leave the funnels more free in the exerciſe of their functions."

6. There is another caſe which is the reverſe of that laſt mentioned. It is where the commanding eminence is farther from the wind than the chimney commanded. To explain this a figure may be neceſſary. Suppoſe then a building whoſe ſide AB happens to be expoſed to the wind, and forms a kind of dam againſt its progreſs. Suppoſe the wind blowing in the direction FE. The air obſtructed by this dam or building AB will like water preſs and ſearch for paſſages through it; but finding none, it is beat back with violence, and ſpreads itſelf on every ſide, as is repreſented by the curved lines *e, e, e, e, e, e*. It will therefore force itſelf down the ſmall chimney C, in order to get through by ſome door or window open on the other ſide of the building. And if there be a fire in ſuch chimney, its ſmoke is of courſe beat down, and fills the room.

Remedy. There is but one remedy, which is to raiſe ſuch a funnel higher than the roof, ſupporting it if neceſſary by iron bars. For a turncap in this caſe has no effect, the dammed-up air preſſing down through it in whatever poſition the wind may have placed its opening.

Dr Franklin mentions a city in which many houſes are rendered ſmoky by this operation. For their kitchens being built behind, and connected by a paſſage with the houſes, and the tops of the kitchen-chimneys lower than the tops of the houſes, the whole ſide of a ſtreet when the wind blows againſt its back forms ſuch a dam as above deſcribed; and the wind ſo obſtructed forces down thoſe kitchen-chimneys (eſpecially when they have but weak fires in them) to paſs through the paſſage and houſe into the ſtreet. Kitchen-chimneys ſo formed and ſituated have another inconvenience. In ſummer, if you open your upper room windows for air, a light breeze blowing over your kitchen-chimney towards the houſe, though not ſtrong enough to force down its ſmoke as aforeſaid, is ſufficient to waft it into your windows, and fill the rooms with it; which, beſides the diſagreeableneſs, damages your furniture.

7. Chimneys, otherwiſe drawing well, are ſometimes made to ſmoke by *the improper and inconvenient ſituation of a door.* When the door and chimney are on the ſame ſide of the room, if the door being in the corner is made to open againſt the wall, which is common, as being there, when open, more out of the way, it follows, that when the door is only opened in part, a current of air ruſhing in paſſes along the wall into and acroſs the opening of the chimney, and flirts ſome of the ſmoke out into the room. This happens more certainly when the door is ſhutting, for then the force of the current is augmented, and becomes very inconvenient to thoſe who, warming themſelves by the fire, happen to ſit in its way.

The *remedies* are obvious and eaſy. Either put an intervening ſcreen from the wall round great part of the fireplace; or, which is perhaps preferable, ſhift the hinges of your door, ſo as it may open the other way, and when open throw the air along the other wall.

8. A room that has no fire in its chimney is ſometimes filled with *ſmoke which is received at the top of its funnel, and deſcends into the room.* Funnels without fires have an effect according to their degree of coldneſs or warmth on the air that happens to be contained in them. The ſurrounding atmoſphere is frequently changing its temperature; but ſtacks of funnels covered from winds and ſun by the houſe that contains them, retain a more equal temperature. If, after a warm ſeaſon, the outward air ſuddenly grows cold, the empty warm funnels begin to draw ſtrongly upward; that is, they rarefy the air contained in them, which of courſe riſes, cooler air enters below to ſupply its place, is rarefied in its turn, and riſes; and this operation continues till the funnel grows cooler, or the outward air warmer, or both, when the motion ceaſes. On the other hand, if after a cold ſeaſon the outward air ſuddenly grows warm and of courſe lighter, the air contained in the cool funnels being heavier deſcends into the room; and the warmer air which enters their tops being cooled in its turn, and made heavier, continues to deſcend; and this operation goes on till the funnels are warmed by the paſſing of warm air through them, or the air itſelf grows

cooler. When the temperature of the air and of the funnels is nearly equal, the difference of warmth in the air between day and night is sufficient to produce these currents: the air will begin to ascend the funnels as the cool of the evening comes on, and this current will continue till perhaps nine or ten o'clock the next morning, when it begins to hesitate; and as the heat of the day approaches, it sets downwards, and continues so till towards evening, when it again hesitates for some time, and then goes upwards constantly during the night, as before mentioned. Now when smoke issuing from the tops of neighbouring funnels passes over the tops of funnels which are at the time drawing downwards, as they often are in the middle part of the day, such smoke is of necessity drawn into these funnels, and descends with the air into the chamber.

The remedy is to have a sliding plate that will shut perfectly the offending funnel. Dr Franklin has thus described it: "The opening of the chimney is contracted by brick-work faced with marble slabs to about two feet between the jams, and the breast brought down to within about three feet of the hearth. An iron frame is placed just under the breast, and extending quite to the back of the chimney, so that a plate of the same metal may slide horizontally backwards and forwards in the grooves on each side of the frame. This plate is just so large as to fill the whole space, and shut the chimney entirely when thrust quite in, which is convenient when there is no fire. Draw it out, so as to leave between its further edge and the back a space of about two inches; this space is sufficient for the smoke to pass; and so large a part of the funnel being stopt by the rest of the plate, the passage of warm air out of the room, up the chimney, is obstructed and retarded; and by those means much cold air is prevented from coming in through crevices, to supply its place. This effect is made manifest three ways. 1. When the fire burns briskly in cold weather, the howling or whistling noise made by the wind, as it enters the room through the crevices, when the chimney is open as usual, ceases as soon as the plate is slid in to its proper distance. 2. Opening the door of the room about half an inch, and holding your hand against the opening, near the top of the door, you feel the cold air coming in against your hand, but weakly, if the plate be in. Let another person suddenly draw it out, so as to let the air of the room go up the chimney, with its usual freedom where chimneys are open, and you immediately feel the cold air rushing in strongly. 3. If something be set against the door, just sufficient, when the plate is in, to keep the door nearly shut, by resisting the pressure of the air that would force it open: then, when the plate is draw out, the door will be forced open by the increased pressure of the outward cold air endeavouring to get in to supply the place of the warm air that now passes out of the room to go up the chimney. In our common open chimneys, half the fuel is wasted, and its effect lost; the air it has warmed being immediately drawn off."

9. Chimneys which generally draw well, do nevertheless sometimes give smoke into the rooms, *it being driven down by strong winds passing over the tops of their funnels*, though not descending from any commanding eminence. This case is most frequent where the funnel is short and the opening turned from the wind. It is the more grievous, when it happens to be a cold wind that produces the effect, because when you most want your fire you are sometimes obliged to extinguish it. To understand this, it may be considered that the rising light air, to obtain a free issue from the funnel, must push out of its way or oblige the air that is over it to rise. In a time of calm or of little wind this is done visibly; for we see the smoke that is brought up by that air rise in a column above the chimney: but when a violent current of air, that is, a strong wind, passes over the top of a chimney, its particles have received so much force, which keeps them in a horizontal direction and follow each other so rapidly, that the rising light air has not strength sufficient to oblige them to quit that direction and move upwards to permit its issue.

Remedies. In Venice, the custom is to open or widen the top of the flue, rounding it in the true form of a funnel. In other places the contrary is practised; the tops of the flues being narrowed inwards, so as to form a slit for the issue of the smoke, long as the breadth of the funnel, and only four inches wide. This seems to have been contrived on a supposition that the entry of the wind would thereby be obstructed and perhaps it might have been imagined, that the whole force of the rising warm air being condensed, as it were, in the narrow opening, would thereby be strengthened, so as to overcome the resistance of wind. This, however, did not always succeed; for when the wind was at north-east and blew fresh, the smoke was forced down by fits into the room where Dr Franklin commonly sat, so as to oblige him to shift the fire into another. The position of the slit of this funnel was indeed north-east and south-west. Perhaps if it had lain across the wind, the effect might have been different. But on this we can give no certainty. It seems a matter proper to be referred to experiment. Possibly a turncap might have been serviceable, but it was not tried.

With all the science, however, that a man shall suppose himself possessed of in this article, he may sometimes meet with cases that shall puzzle him. "I once lodged (says Dr Franklin) in a house at London, which in a little room had a single chimney and funnel. The opening was very small, yet it did not keep in the smoke, and all attempts to have a fire in this room were fruitless. I could not imagine the reason, till at length observing that the chamber over it, which had no fireplace in it, was always filled with smoke when a fire was kindled below, and that the smoke came through the cracks and crevices of the wainscot; I had the wainscot taken down, and discovered that the funnel which went up behind it had a crack many feet in length, and wide enough to admit my arm; a breach very dangerous with regard to fire, and occasioned probably by an apparent irregular settling of one side of the house. The air entering this breech freely, destroyed the drawing force of the funnel. The remedy would have been, filling up the breach, or rather rebuilding the funnel: but the landlord rather chose to stop up the chimney.

"Another puzzling case I met with at a friend's country house near London. His best room had a chimney in which, he told me, he never could have a fire, for all the smoke came out into the room. I flattered myself I could easily find the cause and prescribe the cure. I opened the door, and perceived it was not want of air. I made a temporary contraction of the opening of the chimney, and found that it was not its

being

Smoke, Smoke-Jack.

being too large that caufed the fmoke to iffue. I went out and looked up at the top of the chimney: Its funnel was joined in the fame ftack with others; fome of them fhorter, that drew very well, and I faw nothing to prevent its doing the fame. In fine, after every other examination I could think of, I was obliged to own the infufficiency of my fkill. But my friend, who made no pretenfion to fuch kind of knowledge, afterwards difcovered the caufe himfelf. He got to the top of the funnel by a ladder, and looking down found it filled with twigs and ftraw cemented by earth and lined with feathers. It feems the houfe after being built, had ftood empty fome years before he occupied it; and he concluded that fome large birds had taken the advantage of its retired fituation to make their neft there. The rubbifh, confiderable in quantity, being removed, and the funnel cleared, the chimney drew well, and gave fatisfaction."

Chimneys whofe funnels go up in the north wall of a houfe, and are expofed to the north winds, are not fo apt to draw well as thofe in a fouth wall; becaufe when rendered cold by thofe winds, they draw downwards.

Chimneys inclofed in the body of a houfe are better than thofe whofe funnels are expofed in cold walls.

Chimneys in ftacks are apt to draw better than feparate funnels, becaufe the funnels that have conftant fires in them warm the others in fome degree that have none.

SMOKE Jack. This ingenious machine is of German origin, and Meffinger, in his *Collection of Mechanical Performances*, fays it is very ancient, being reprefented in a painting at Nurenbergh, which is known to be older than the year 1350.

Plate cccxcvii. Fig. 5.

Its conftruction is abundantly fimple. An upright iron fpindle GA (fig. 5.), placed in the narrow part of the kitchen chimney, turns round on two points H and I. The upper one H paffes through an iron bar, which is built in acrofs the chimney; and the lower pivot I is of tempered fteel, and is conical or pointed, refting in a conical bell-metal focket fixed on another crofs bar. On the upper end of the fpindle is a circular fly G, confifting of 4, 6, 8, or more thin iron plates, fet obliquely on the fpindle like the fails of a windmill, as we fhall defcribe more particularly by and by. Near the lower end of the fpindle is a pinion A, which works in the teeth of a contrate or face wheel B, turning on a horizontal axis BC. One pivot of this axis turns in a cock fixed on the crofs bar, which fupports the lower end of the upright fpindle HI, and the other pivot turns in a cock fixed on the fide wall of the chimney; fo that this axle is parallel to the front of the chimney. On the remote end of this horizontal axle there is a fmall pulley C, having a deep angular groove. Over this pulley there paffes a chain CDE, in the lower bight of which hangs the large pulley E of the fpit. This end of the fpit turns loofely between the branches of the fork of the rack or raxe F, but without refting on it. This is on the top of a moveable ftand, which can be fhifted nearer to or farther from the fire. The other end turns in one of the notches of another rack. The number of teeth in the pinion A and wheel B, and the diameters of the pulleys C and E, are fo proportioned that the fly G makes from 12 to 20 turns for one turn of the fpit.

Smoke-Jack.

The manner of operation of this ufeful machine is eafily underftood. The air which contributes to the burning of the fuel, and paffes through the midft of it, is greatly heated, and expanding prodigioufly in bulk, becomes lighter than the neighbouring air, and is therefore pufhed by it up the chimney. In like manner, all the air which comes near the fire is heated, expanded, becomes lighter, and is driven up the chimney. This is called the *draught* or *fuction*, but would with greater propriety be termed the *drift* of the chimney. As the chimney gradually contracts in its dimenfions, and as the fame quantity of heated air paffes through every fection of it, it is plain that the rapidity of its afcent muft be greateft in the narroweft place. There the fly G fhould be placed, becaufe it will there be expofed to the ftrongeft current. The air, ftriking the fly vanes obliquely, pufhes them afide, and thus turns them round with a confiderable force. If the joint of meat is exactly balanced on the fpit, it is plain that the only refiftance to the motion of the fly is what arifes from the friction of the pivots of the upright fpindle, the friction of the pinion and wheel, the friction of the pivots of the horizontal axis, the friction of the fmall end of the fpit, and the friction of the chain in the top pulleys. The whole of this is but a mere trifle. But there is frequently a confiderable inequality in the weight of the meat on different fides of the fpit: there muft therefore be a fufficient overplus of force in the impulfe of the afcending air on the vanes of the fly, to overcome this want of equilibrium occafioned by the unfkilfulnefs or negligence of the cook. There is, however, commonly enough of power when the machine is properly conftructed. The utility of this machine will, we hope, procure us the indulgence of fome of our readers, while we point out the circumftances on which its performance depends, and the maxims which fhould be followed in its conftruction.

The upward current of air is the moving power, and fhould be increafed as much as poffible, and applied in the moft advantageous manner. Every thing will increafe the current which improves the draught of the chimney, and fecures it from fmoking. A fmoky chimney muft always have a weak current. For this particular, therefore, we refer to what has been delivered in the article PNEUMATICS, N° 359; and the article SMOKE.

With refpect to the manner of applying this force, it is evident that the beft conftruction of a windmill fails will be nearly the beft conftruction for the fly. According to the ufual theory of the impulfe of fluids, the greateft effective impulfe (that is, in the direction of the fly's motion) will be produced if the plane of the vane be inclined to the axis in an angle of 54 degrees 46 minutes. But, fince we have pronounced this theory to be fo very defective, we had better take a determination founded on the experiments on the impulfe of fluids made by the academy of Paris. Thefe authorife us to fay, that 49½ or 50 degrees will be the beft angle to give the vane: but this muft be underftood only of that part of it which is clofe adjoining to the axis. The vane itfelf muft be twifted, or *weathered* as the millwrights term it, and muft be much more oblique at its outer extremity. The exact pofition cannot be determined with any precifion: becaufe this depends on the

prop rtion

Smoke-Jack.

proportion of the velocity of the vane to that of the current of heated air. This is fubject to no rule, being changed according to the load of the jack. We imagine that an obliquity of 65 degrees for the outer ends of the vanes will be a good pofition for the generality of cafes. Meffinger defcribes an ingenious contrivance for changing this angle at pleafure, in order to vary the velocity of the motion. Each vane is made to turn round a midrib, which ftands out like a radius from the fpindle, and the vane is moved by a ftiff wire attached to one of the corners adjoining to the axle. Thefe wires are attached to a ring which flides on the fpindle like the fpreader of an umbrella; and it is ftopped on any part of the fpindle by a pin thruft through a hole in the fpindle and ring. We mention this briefly, it being eafily underftood by any mechanic, and but of little confequence, becaufe the machine is not fufceptible of much precifion.

It is eafy to fee that an increafe of the furface of the vanes will increafe the power: therefore they fhould occupy the whole fpace of the circle, and not confift of four narrow arms like the fails of a windmill. It is better to make many narrow vanes than a few broad ones; as will appear plain to one well acquainted with the mode of impulfe of fluids acting obliquely. We recommend eight or twelve at leaft; and each vane fhould be fo broad, that when the whole is held perpendicular between the eye and the light, no light fhall come through the fly, the vanes overlapping each other *a very fmall matter*. We alfo recommend the making them of ftiff plate. Their weight contributes to the fteady motion, and enables the fly, which has acquired a confiderable velocity during a favourable pofition of things, to retain a momentum fufficient to pull round the fpit while the heavy fide of the meat is rifing from its loweft pofition. In fuch a fituation a light fly foon lofes its momentum, and the jack ftaggers under its load.

It is plain, from what has been faid, that the fly fhould occupy the whole of that fection of the vent where it is placed. The vent muft therefore be brought to a round form in that place, that none of the current may pafs ufelefsly by it.

It is an important queftion where the fly fhould be placed. If in a wide part of the vent, it will have a great furface, and act by a long lever; but the current in that place is flow, and its impulfe weak. This is a fit fubject of calculation. Suppofe that we have it in our choice to place it either as it is drawn in the figure, or farther up at *g*, where its diameter muft be one half of what it is at G. Since the fame quantity of heated air paffes through both fections, and the fection *g* has only one-fourth of the area of the fection G, it is plain that the air muft be moving four times fafter, and that its impulfe is 16 times greater. But the furface on which it is acting is the fourth part of that of the fly G; the actual impulfe therefore is only four times greater, fuppofing both flies to be moving with the fame relative velocity in refpect of the current; that is, the rim of each moving with the fame portion of the velocity of the current. This will be the cafe when the fmall fly turns eight times as often in a minute as the large fly: for the air is moving four times as quick at *g*, and the diameter of *g* is one-half of that of G. Therefore, when the fmall fly is turning eight times as quick as the great one, there is a quadruple impulfe acting at half the diftance from the axis. The momentum or energy therefore of the current is double. Therefore, fuppofing the pinion, wheel, and pulleys of both jacks to be the fame, the jack with the fmall fly, placed in the narrow part of the vent, will be 16 times more powerful.

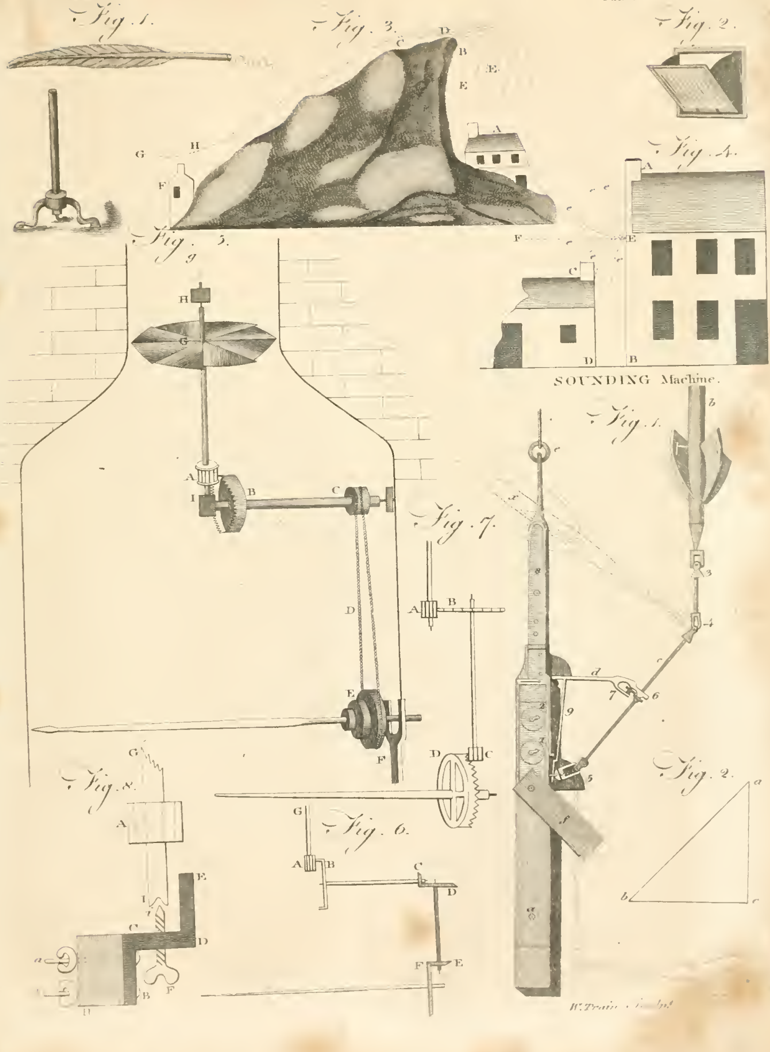
By this example, more eafily underftood than a general procefs, it appears that it is of particular importance to place the fly in an elevated part of the vent, where the area may be much contracted. In order ftill farther to increafe the power of the machine, it would be very proper to lengthen the fpindle ftill more, and to put another fly on it at a confiderable diftance above the firft, and a third above this, &c.

As the velocity of the current changes by every change of the fire, the motion of this jack muft be very unfteady. To render it as adjuftable as may be to the particular purpofe of the cook, the pulley E has feveral grooves of different diameters, and the fpit turns more or lefs flowly, by the fame motion of the fly, according as it hangs in the chain by a larger or fmaller pulley or groove.

Such is the conftruction of the fmoke-jack in its moft fimple form. Some are more artificial and complicated, having, in place of the pulleys and connecting chain, a fpindle coming down from the horizontal axis BC. On the upper end of this fpindle is a horizontal contrate wheel, driven by a pinion in place of the pulley C. On the lower end is a pinion, driving a contrate wheel in place of the pulley E. This conftruction is reprefented in fig. 6. Others are conftructed more fimply, in Fig. 6.
the manner reprefented in fig. 7. But our firft con- Fig. 7.
ftruction has great advantage in point of fimplicity, and allows a more eafy adjuftment of the fpit, which may be brought nearer to the fire or removed farther from it without any trouble; whereas, in the others, with a train of wheels and pinions, this cannot be done without feveral changes of pins and fcrews. The only imperfection of the pulley is, that by long ufe the grooves become flippery, and an ill-balanced joint is apt to hold back the fpit, while the chain flides in the grooves. This may be completely prevented by making the grooves flat inftead of angular (which greatly diminifhes the friction), and furnifhing them with fhort ftuds or pins which take into every third or fourth link of the chain. If the chain be made of the fimpleft form, with flat links, and each link be made of an exact length (making them all on a mould), the motion will be as eafy as with any wheelwork, and without the leaft chance of flipping.

It is always of importance to avoid this flipping of the chain by balancing the loaded fpit. For this purpofe it will be extremely convenient to have what is called a *balance-fkewer*. Let a part of the fpit, immediately adjoining to the pulley, be made round, and let an arm be made to turn on it ftiffly, fo that it may be made faft in any pofition by a fcrew. Let a leaden ball be made to flide along this arm, with a fcrew to faften it at any diftance from the fpit. When the meat is fpitted, lay it on the racks, and the heavieft fide will immediately place itfelf undermoft. Now turn round the balance-fkewer, fo that it may point ftraight upwards, and make it faft in that pofition by the fcrew. Put the leaden ball on it, and flide it inwards or outwards

Plate CCCCXCVII.



Smoke-Jack.

wards till it exactly balances the heavy side, which will appear by the spit's remaining in any position in which it is put.

The greatest difficulty is to keep the machine in repair. The essential part of it, the first mover, the fly, and the pinion and wheel, by which its motion is transmitted to the rest of the machine, are situated in a place of difficult access, and where they are exposed to violent heat and to the smoke and soot. The whole weight of the fly, resting on the lower pivot I, must exert a great pressure there, and occasion great friction, even when this pinion is reduced to the smallest size that is compatible with the necessary strength. The pivot must be of hardened steel, tapered like an obtuse cone, and must turn in a conical socket, also of hardened steel or of bell-metal; and this seat of pressure and friction must be continually supplied with oil, which it consumes very quickly. It is not sufficient that it be from time to time smeared with an oiled feather; there must be an iron cup formed round the socket, and kept filled with oil. It is surprising how quickly it disappears; it soon becomes clammy by evaporation, and by the soot which gathers about it. The continued rubbing of the pivot and socket wears them both very fast; and this is increased by hard powders, such as sandy dust, that are hurried up by the rapid current every time that the cook stirs the fire. These, getting between the rubbing parts, cause them to grind and wear each other prodigiously. It is a great improvement to invert these rubbing parts. Let the lower end of the spindle be of a considerable thickness, and have a conical hollow nicely drilled in its extremity. Let a blunt-pointed conical pin rise up in the middle of the oil cup, on which the conical hollow of the spindle may rest. Here will be the same steady support, and the same friction as in the other way; but no grinding dust can now lodge between the pivot and its socket: and if this upright pin be screwed up through the bottom of the cup, it may be screwed farther up in proportion as it wears; and thus the upper pivot *g* will never desert its hole, a thing which soon happens in the common way. We can say from experience, that a jack constructed in this way will not require the fifth part of the repairs of one done in the other way.

It is of importance that the whole be so put together as to be easily taken down, in order to sweep the vent, or to be repaired, &c. For this purpose, let the cross bar which carries the lower end of the upright spindle be placed a little on one side of the perpendicular line from the upper pivot hole. Let the cock which carries the oil-cup and the pivot of the horizontal axis BC be screwed to one side of this cross bar, so that the centre of the cup may be exactly under the upper pivot hole. By this construction we have only to unscrew this cock, and then both axles come out of their places at once, and may be replaced without any trouble. We have sketched in fig. 8. the manner in which this may be done, where M represents a section of the lower cross bar. BCDE is the cock, fixed to the bar by the pins which go through both, with finger nuts *a* and *b* on the opposite side. F *i* is the hard steel pin with the conical top *i*, on which the lower end I of the upright spindle AG rests, in the manner recommended as the best and most durable. The pivot of the horizontal axis turns in a hole at E the top of the cock.

Fig. 8.

After all, we must acknowledge that the smoke-jack is inferior to the common jack that is moved by a weight. It is more expensive at first, and requires more frequent repairs; its motion is not so much under command; it occasions soot to be thrown about the fire, to the great annoyance of the cook; and it is a great encumbrance when we would clean the vent.

Smoke-Jack || Smollet.

SMOKE-Farthings. The pentecostals or customary oblations offered by the dispersed inhabitants within a diocese when they made their procession to the mother or cathedral church, came by degrees into a standing annual rent called *smoke-farthings*.

SMOKE-Silver. Lands were holden in some places by the payment of the sum of 6d. yearly to the sheriff, called *smoke-silver* (Par. 4. Edw. VI.). Smoke-silver and smoke-penny are to be paid to the ministers of divers parishes as a *modus* in lieu of tithe-wood: and in some manors formerly belonging to religious houses, there is still paid, as appendant to the said manors, the ancient Peter-pence, by the name of *smoke-money* (*Twisd. Hist. Vindicat.* 77.).—The bishop of London *anno* 1444 issued out his commission, *Ad levandum le* smoke-farthings, &c.

SMOLENSKO, a large and strong city of Russia, and capital of a palatinate of the same name, with a castle seated on a mountain, and a bishop's see. It is strong by its situation, being in the middle of a wood, and surrounded by almost inaccessible mountains. It has been taken and retaken several times by the Poles and Russians; but these last have had possession of it ever since the year 1687. It is seated on the river Nieper, near the frontiers of Lithuania, 188 miles south-west of Moscow. E. Long. 31. 22. N. Lat. 54. 50.

SMOLENSKO, a duchy and palatinate of Russia, bounded on the north by Biela, on the east by the duchy of Moscow, on the south by that of Severia and the palatinate of Meislaw, and on the west by the same palatinate and by that of Witepsk. It is full of forests and mountains: and the capital is of the same name.

SMOLLET, Dr Tobias, an author whose writings will transmit his name with honour to posterity, was born in the year 1720 at a small village within two miles of Cameron, on the banks of the river Leven. He appears to have received a classical education, and was bred to the practice of physic and surgery; and in the early part of his life served as a surgeon's mate in the navy.

The incidents that befel him during his continuance in this capacity served as a foundation for Roderic Random, one of the most entertaining novels in the English tongue. He was present at the siege of Carthagena; and in the before mentioned novel he has given a faithful, though not very pleasing, account of the management of that ill-conducted expedition, which he censures in the warmest terms, and from circumstances which fell under his own particular observation.

His connection with the sea seems not to have been of long continuance; and it is probable that he wrote several pieces before he became known to the public by his capital productions. The first piece we know of with certainty is a Satire in two parts, printed first in the years 1746 and 1747, and reprinted in a Collection of his Plays and Poems in 1777. About this period, or some time before, he wrote for Mr Rich an opera intitled Alceste, which has never been performed nor printed.

At

Smollet.

At the age of 18 he wrote a tragedy intitled The Regicide, founded on the ftory of the affaffination of James I. of Scotland. In the preface to this piece, publifhed by fubfcription in the year 1749, he bitterly exclaimed againft falfe patrons, and the duplicity of theatrical managers. The warmth and impetuofity of his temper hurried him, on this occafion, into unjuft reflections againft the late George Lord Lyttleton and Mr Garrick: the character of the former he characterifed in the novel of Peregrine Pickle, and he added a burlefque of the Monody written by that nobleman on the death of his lady. Againft Mr Garrick he made illiberal ill-founded criticifms; and in his novel of Roderic Random gave a very unfair reprefentation of his treatment of him refpecting this tragedy. Of this conduct he afterwards repented, and acknowledged his errors; though in the fubfequent editions of the novel the paffages which were the hafty effufions of difappointment were not omitted.

However, in giving a fketch of the liberal arts in his Hiftory of England, he afterwards remarked, "the exhibitions of the ftage were improved to the moft exquifite entertainment by the talents and management of Garrick, who greatly furpaffed all his predeceffors of this and perhaps every other nation, in his genius for acting, in the fweetnefs and variety of his tones, the irrefiftible magic of his eye, the fire and vivacity of his action, the eloquence of attitude, and the whole pathos of expreffion.

Not fatisfied with this public declaration, he wrote an apology to Mr Garrick in ftill ftronger terms. With thefe ample conceffions, Mr Garrick was completely fatisfied; fo that in 1757, when Dr Smollet's comedy of the Reprifals, an afterpiece of two acts, was performed at Drury Lane theatre, the latter acknowledged himfelf highly obliged for the friendly care of Mr Garrick exerted in preparing it for the ftage; and ftill more for his acting the part of Lufignan in Zara for his benefit, on the fixth inftead of the ninth night, to which he was only intitled by the cuftom of the theatre.

The Adventures of Roderic Random, publifhed in 1748, 2 vols 12mo, a book which ftill continues to have a moft extenfive fale, firft eftablifhed the Doctor's reputation. All the firft volume and the beginning of the fecond appear to confift of real incident and character, though certainly a good deal heightened and difguifed. The judge his grandfather, Crab and Potion the two apothecaries, and 'Squire Gawky, were characters well known in that part of the kingdom where the fcene was laid. Captains Oakhum and Whiffle, Doctors Mackfhane and Morgan, were alfo faid to be real perfonages; but their names we have either never learned or have now forgotten. A bookbinder and barber long eagerly contended for being fhadowed under the name of *Strap*. The Doctor feems to have enjoyed a peculiar felicity in defcribing fea characters, particularly the officers and failors of the navy. His Trunnion, Hatchway, and Pipes, are highly finifhed originals; but what exceeds them all, and perhaps equals any character that has yet been painted by the happieft genius of ancient or modern times, is his Lieutenant Bowling. This is indeed nature itfelf; original, *unique*, and *fui generis*.

By the publication of this work the Doctor had acquired fo great a reputation, that henceforth a certain degree of fuccefs was infured to every thing known or fufpected to proceed from his hand. In the courfe of a few years, the Adventures of Peregrine Pickle appeared; a work of great ingenuity and contrivance in the compofition, and in which an uncommon degree of erudition is difplayed, particularly in the defcription of the entertainment given by the Republican Doctor, after the manner of the ancients. Under this perfonage the late Dr Akenfide, author of The Pleafures of Imagination, is fuppofed to be typified; and it would be difficult to determine whether profound learning or genuine humour predominate moft in this epifode. Another epifode of The Adventures of a Lady of Quality, likewife inferted in this work, contributed greatly to its fuccefs, and is indeed admirably executed; the materials, it is faid, the lady herfelf (the celebrated Lady *Vane*) furnifhed.

Thefe were not the only original compofitions of this ftamp with which the Doctor has favoured the public. Ferdinand Count Fathom, and Sir Launcelot Greaves, are ftill in the lift of what may be called *reading novels*, and have gone through feveral editions; but there is no injuftice in placing them in a rank far below the former. No doubt invention, character, compofition, and contrivance, are to be found in both; but then fituations are defcribed which are hardly poffible, and characters are painted which, if not altogether unexampled, are at leaft incompatible with modern manners; and which ought not to be, as the fcenes are laid in modern times.

The laft work which we believe the Doctor publifhed was of much the fame fpecies, but caft into a different form—The Expedition of Humphrey Clinker. It confifts of a feries of letters, written by different perfons to their refpective correfpondents. He has here carefully avoided the faults which may be juftly charged to his two former productions. Here are no extravagant characters nor unnatural fituations. On the contrary, an admirable knowledge of life and manners is difplayed; and moft ufeful leffons are given applicable to interefting but to very common fituations.

We know not whether the remark has been made, but there is certainly a very obvious fimilitude between the characters of the three heroes of the Doctor's chief productions. Roderic Random, Peregrine Pickle, and Matthew Bramble, are all brothers of the fame family. The fame fatirical, cynical difpofition, the fame generofity and benevolence, are the diftinguifhing and characteriftical features of all three; but they are far from being fervile copies or imitations of each other. They differ as much as the Ajax, Diomed, and Achilles of Homer. This was undoubtedly a great effort of genius; and the Doctor feems to have defcribed his own character at the different ftages and fituations of his life.

Before he took a houfe at Chelfea, he attempted to fettle as practitioner of phyfic at Bath; and with that view wrote a treatife on the waters; but was unfuccefsful, chiefly becaufe he could not render himfelf agreeable to the women, whofe favour is certainly of great confequence to all candidates for eminence, whether in medicine or divinity. This, however, was a little extraordinary; for thofe who remembered Dr Smollet at that time, cannot but acknowledge that he was as graceful and handfome a man as any of the age he lived in; befides, Smollet. beſides, there was a certain dignity in his air and manner which could not but inſpire reſpect wherever he appeared. Perhaps he was too ſoon diſcouraged; in all probability, had he perſevered, a man of his great learning, profound ſagacity, and intenſe application, beſides being endued with every other external as well as internal accompliſhment, muſt have at laſt ſucceeded, and, had he attained to common old age, been at the head of his profeſſion.

Abandoning phyſic altogether as a profeſſion, he fixed his reſidence at Chelſea, and turned his thoughts entirely to writing. Yet, as an author, he was not near ſo ſucceſsful as his happy genius and acknowledged merit certainly deſerved. He never acquired a patron among the great, who by his favour or beneficence relieved him from the neceſſity of writing for a ſubſiſtence. The truth is, Dr Smollet poſſeſſed a loftineſs and elevation of ſentiment and character which appear to have diſqualified him for paying court to thoſe who were capable of conferring favours. It would be wrong to call this diſpoſition pride or haughtineſs; for to his equals and inferiors he was ever polite, friendly, and generous. Bookſellers may therefore be ſaid to have been his only patrons; and from them he had conſtant employment in tranſlating, compiling, and reviewing. He tranſlated Gil Blas and Don Quixote, both ſo happily, that all the former tranſlations of theſe excellent productions of genius have been almoſt ſuperſeded by his. His name likewiſe appears to a tranſlation of Voltaire's Proſe Works; but little of it was done by his own hand; he only reviſed it, and added a few notes. He was concerned in a great variety of compilations. His Hiſtory of England was the principal work of that kind. It had a moſt extenſive ſale; and the Doctor is ſaid to have received 2000l. for writing it and the continuation.

In 1755 he ſet on foot the Critical Review, and continued the principal manager of it till he went abroad for the firſt time in the year 1763. He was perhaps too acrimonious ſometimes in the conduct of that work; and at the ſame time diſplayed too much ſenſibility when any of the unfortunate authors attempted to retaliate whoſe works he had perhaps juſtly cenſured.

Among other controverſies in which his engagements in this publication involved him, the moſt material in its conſequences was that occaſioned by his remarks on a pamphlet publiſhed by Admiral Knowles. That gentleman, in defence of his conduct on the expedition to Rochfort, publiſhed a vindication of himſelf; which falling under the Doctor's examination, produced ſome very ſevere ſtrictures both on the performance and on the character of the writer. The admiral immediately commenced a proſecution againſt the printer; declaring at the ſame time that he deſired only to be informed who the writer was, that if he proved to be a gentleman he might obtain the ſatisfaction of one from him. In this affair the Doctor behaved both with prudence and with ſpirit. Deſirous of compromiſing the diſpute with the admiral in an amicable manner, he applied to his friend Mr Wilkes to interpoſe his good offices with his opponent. The admiral, however, was inflexible; and juſt as ſentence was going to be pronounced againſt the printer, the Doctor came into court, avowed himſelf the author of the Strictures, and declared himſelf ready to give Mr Knowles any ſatisfaction he choſe. The admiral immediately commenced a freſh action againſt the Doctor, who was found guilty, fined 100l., and condemned to three months impriſonment in the King's Bench. It is there he is ſaid to have written the Adventures of Sir Launcelot Greaves, in which he has deſcribed ſome remarkable characters, then his fellow-priſoners. Smollet.

When Lord Bute was called to the chief adminiſtration of affairs, he was prevailed upon to write in defence of that nobleman's meaſures; which he did in a weekly paper called the *Briton*. This gave riſe to the famous North Briton; wherein, according to the opinion of the public, he was rather baffled. The truth is, the Doctor did not ſeem to poſſeſs the talents neceſſary for political altercation. He wanted temper and coolneſs; and his friends accuſed his patron of having denied him the neceſſary information, and even neglected the fulfilling of ſome of his other engagements with him. Be that as it will, the Doctor is ſaid not to have forgotten him in his ſubſequent performances.

Beſides the Briton, Dr Smollet is ſuppoſed to have written other pieces in ſupport of the cauſe he eſpouſed. The Adventures of an Atom, in two volumes, are known to be his production.

His conſtitution being at laſt greatly impaired by a ſedentary life and aſſiduous application to ſtudy, he went abroad for his health in June 1763, and continued in France and Italy two years. He wrote an account of his travels in a ſeries of letters to ſome friends, which were afterwards publiſhed in two volumes octavo, 1766. During all that time he appears to have laboured under a conſtant fit of chagrin. A very ſlight peruſal of theſe letters will ſufficiently evince that this obſervation is founded in fact, and is indeed a melancholy inſtance of the influence of bodily diſtemper over the beſt diſpoſition.

His relation of his travels is actually cynical; for which Sterne, in his Sentimental Journey, has animadverted on him under the character of Smelfungus. The Doctor lived to return to his native country: but his health continuing to decline, and meeting with freſh mortifications and diſappointments, he went back to Italy, where he died in October 21. 1771. He was employed, during the laſt years of his life, in abridging the Modern Univerſal Hiſtory, great part of which he had originally written himſelf, particularly the hiſtories of France, Italy, and Germany.

He certainly met with many mortifications and diſappointments; which, in a letter to Mr Garrick, he thus feelingly expreſſes: "I am old enough to have ſeen and obſerved, that we are all playthings of Fortune; and that it depends upon ſomething as inſignificant and precarious as the toſſing up of a halfpenny, whether a man riſes to affluence and honours, or continues to his dying day ſtruggling with the difficulties and diſgraces of life."

It would be needleſs to expatiate on the character of a man ſo well known as Dr Smollet, who has, beſides, given ſo many ſtrictures of his own character and manner of living in his writings, particularly in Humphrey Clinker; where he appears under the appellation of *Mr Serle*, and has an interview with Mr Bramble; and his manner of living is deſcribed in another letter, where young Melford is ſuppoſed to dine with him at his houſe in Chelſea. No doubt he made money by his connec-

Smollet, Smugglers.

tions with the bookſellers; and had he been a rigid economiſt, or endued with the gift of retention (an expreſſion of his own), he might have lived and died very independent. However, to do juſtice to his memory, his difficulties, whatever they were, proceeded not from extravagance or want of economy. He was hoſpitable, but not oſtentatiouſly ſo; and his table was plentiful, but not extravagant. No doubt he had his failings; but ſtill it would be difficult to name a man who was ſo reſpectable for the qualities of his head, or more amiable for the virtues of his heart.

Since his death a monument has been erected to his memory near Leghorn, on which is inſcribed an epitaph written in Latin by his friend Dr Armſtrong, author of The Art of Preſerving Health, and many other excellent pieces. An inſcription written in Latin was likewiſe inſcribed on a pillar erected to his memory on the banks of the Leven, by one of his relations.

To theſe memoirs we are extremely ſorry to add, that ſo late as 1785 the widow of Dr Smollet was reſiding in indigent circumſtances at Leghorn. On this account the tragedy of Venice Preſerved was acted for her benefit at Edinburgh on the 5th of March, and an excellent prologue ſpoken on that occaſion.

The pieces inſerted in the poſthumous collection of Dr Smollet's plays and poems are, The Regicide, a tragedy: The Repriſal, a comedy; Advice and Reproof, two ſatires; The Tears of Scotland; Verſes on a Young Lady; a Love Elegy, in imitation of Tibullus; two Songs; a Burleſque Ode; Odes to Mirth, to Sleep, to Leven Water, to Blue-ey'd Ann, and to Independence.

SMUGGLERS, perſons who import or export prohibited goods without paying the duties appointed by the law.

The duties of cuſtoms, it is ſaid, were originally inſtituted, in order to enable the king to afford protection to trade againſt pirates: they have ſince been continued as a branch of the public revenue. As duties impoſed upon the importation of goods neceſſarily raiſe their price above what they might otherwiſe have been ſold for, a temptation is preſented to import the commodity clandeſtinely and to evade the duty. Many perſons, prompted by the hopes of gain, and conſidering the violation of a poſitive law of this nature as in no reſpect criminal (an idea in which they have been encouraged by a great part of the community, who make no ſcruple to purchaſe ſmuggled goods), have engaged in this illicit trade. It was impoſſible that government could permit this practice, which is highly injurious to the fair trader, as the ſmuggler is enabled to underſell him, while at the ſame time he impairs the national revenue, and thus wholly deſtroys the end for which theſe duties were appointed. Such penalties are therefore inflicted as it was thought would prevent ſmuggling.

[illegible] Law Dictionary, [illegible]

Many laws have been made with this view. If any goods be ſhipped or landed without warrant and preſence of an officer, the veſſel ſhall be forfeited, and the wharfinger ſhall forfeit 100l. and the maſter or mariner of any ſhip inward bound ſhall forfeit the value of the goods: and any carman, porter, or other aſſiſting, ſhall be committed to gaol, till he find ſurety of his good behaviour, or until he ſhall be diſcharged by the court of exchequer (13 & 14 C. II. c. 11.) If goods be relanded after drawback, the veſſel and goods ſhall be forfeited; and every perſon concerned therein ſhall forfeit double the value of the drawback (8 An. c. 13.) Goods taken in at ſea ſhall be forfeited, and alſo the veſſel into which they are taken; and every perſon concerned therein ſhall forfeit treble value (9 G. II. c. 35.) A veſſel hovering near the coaſt ſhall be forfeited, if under 50 tons burden; and the goods ſhall alſo be forfeited, or the value thereof (5 G. III. c. 43.) Perſons receiving or buying run goods ſhall forfeit 20l. (8 G. c. 18.) A concealer of run goods ſhall forfeit treble value (8 G. c. 18.) Offering run goods to ſale, the ſame ſhall be forfeited, and the perſon to whom they are offered may ſeize them; and the perſon offering them to ſale ſhall forfeit treble value (11 G. c. 30.) A porter or other perſon carrying run goods ſhall forfeit treble value (9 G. II. c. 35.) Perſons armed or diſguiſed carrying run goods ſhall be guilty of felony, and tranſported for ſeven years (8 G. c. 18. 9 G. II. c. 35.)

But the laſt ſtatute, 19 G. II. c. 34. is for this purpoſe *inſtar omnium;* for it makes all forcible acts of ſmuggling, carried on in defiance of the laws, or even in diſguiſe to evade them, felony without benefit of clergy: enacting, that if three or more perſons ſhall aſſemble, with fire-arms or other offenſive weapons, to aſſiſt in the illegal exportation or importation of goods, or in reſcuing the ſame after ſeizure, or in reſcuing offenders in cuſtody for ſuch offences: or ſhall paſs with ſuch goods in diſguiſe; or ſhall wound, ſhoot at, or aſſault, any officers of the revenue when in the execution of their duty; ſuch perſons ſhall be felons, without the benefit of clergy.

When we conſider the nature, and ſtill more the hiſtory of mankind, we muſt allow that the enacting of ſevere penal laws is not the way to prevent crimes. It were indeed much to be wiſhed that there were no ſuch thing as a political crime; for the generality of men, but eſpecially the lower orders, not diſcerning the propriety or utility of ſuch laws, conſider them as oppreſſive and tyrannical, and never heſitate to violate them when they can do it with impunity. Inſtead therefore of puniſhing ſmugglers, it would be much better to remove the temptation. But the high duties which have been impoſed upon the importation of many different ſorts of foreign goods, in order to diſcourage their conſumption in Great Britain, have in many caſes ſerved only to encourage ſmuggling; and in all caſes have reduced the revenue of the cuſtoms below what more moderate duties would have afforded. The ſaying of Dr Swift, that in the arithmetic of the cuſtoms two and two, inſtead of making four, make ſometimes only one, holds perfectly true with regard to ſuch heavy duties, which never could have been impoſed, had not the mercantile ſyſtem taught us, in many caſes, to employ taxation as an inſtrument, not of revenue, but of monopoly.

Smith's Wealth of Nations, vol. iii.

The bounties which are ſometimes given upon the exportation of home produce and manufactures, and the drawbacks which are paid upon the re-exportation of the greater part of foreign goods, have given occaſion to many frauds, and to a ſpecies of ſmuggling more deſtructive of the public revenue than any other. In order to obtain the bounty or drawback, the goods, it is well known, are ſometimes ſhipped and ſent to ſea, but

ſoon

soon afterwards clandestinely relanded in some other part of the country.

Heavy duties being imposed upon almost all goods imported, our merchant importers smuggle as much, and make entry of as little as they can. Our merchant exporters, on the contrary, make entry of more than they export; sometimes out of vanity, and to pass for great dealers in goods which pay no duty; and sometimes to gain a bounty or a drawback. Our exports, in consequence of these different frauds, appear upon the customhouse books greatly to overbalance our imports; to the unspeakable comfort of those politicians who measure the national prosperity by what they call the balance of trade.

SMUT, in *Husbandry*, a disease in corn, when the grains, instead of being filled with flour, are full of a stinking black powder. See WHEAT.

SMYRNA, or ISMIR, at present the largest and richest city of Asia Minor, is situated in north latitude 38° 28′, and in E. Long. 27° 25′ from Greenwich, and about 183 miles west by south of Constantinople. The town extends along the shore about half a mile on a gentle declivity. The houses of the English, French, and Dutch consuls are handsome structures; these, with most of those occupied by the Christian merchants, are washed on one side by the sea, forming a street named *Frank-street*, from its being solely inhabited by European Christians. In the year 1763 the whole of this quarter was consumed by fire: the loss sustained by this calamity in merchandise was estimated at a million and a half of Turkish dollars, or near 200,000l. sterling. The port is one of the finest of the Levant, it being able to contain the largest fleet; and indeed there are seldom in it fewer than 100 ships of different nations.

A castle stands at its entrance, and commands all the shipping which sail in or out. There is likewise an old ruinous castle, near a mile in circumference, which stands in the upper part of the city, and, according to tradition, was built by the empress Helena: and near it is an ancient structure, said to be the remains of a palace where the Greek council was held when Smyrna was the metropolis of Asia Minor. They also show the ruins of an amphitheatre, where it is said St Polycarp, the first bishop, fought with lions.

This city is about four miles in circumference, and nearly of a triangular form; but the side next the mountain is much longer than the other sides. The houses are low, and mostly built with clay walls, on account of the earthquakes to which the country is subject; but the caravanseras and some other of the public buildings have an air of magnificence. The streets are wide, and almost a continued bazar, in which a great part of the merchandise of Europe and Asia is exposed to sale, with plenty of provisions; though these are not so cheap as in many other parts of Turkey, on account of the populousness of the place, and the great resort of foreigners. It is said to contain 15,000 Turks 10,000 Greeks, 1800 Jews, 200 Armenians, and 200 Franks: but the whole population is computed at 120,000. The Turks have 19 mosques; two churches belong to the Greeks; one to the Armenians; and the Jews have eight synagogues. The Romanists have three convents. There is also one of the fathers Della Terra Santa. Here resides an archbishop of the Greek church; a Latin bishop who has a salary from Rome, with the title of bishop of Smyrna *in partibus infidelium*; and the English and Dutch factories have each their chaplain.

The walks about the town are extremely pleasant, particularly on the west side of Frank street, where there are several little groves of orange and lemon trees, which being always clothed with leaves, blossoms, and fruit, regale several of the senses at the same time. The vines which cover the little hills about Smyrna afford both a delightful prospect and plenty of grapes, of which good wine is made. These hills are agreeably interspersed with fertile plains, little forests of olives and other fruit-trees, and many pleasure-houses, to which the Franks usually retire during the summer. In the neighbourhood of Smyrna is great plenty of game and wild-fowl, and particularly deer and wild-hogs. The sea also abounds with a variety of good fish. The European Christians are here allowed all imaginable liberties, and usually clothe themselves after the European manner.

The chief commerce of this city consists in raw silk, silk-stuffs, grograms, and cotton yarn.

However, the unhealthfulness of the situation, and more especially the frequent earthquakes, from which, it is said, they are scarcely ever free for two years together, and which have been felt 40 days successively, are an abatement of the pleasure that might otherwise be enjoyed here. A very dreadful one happened in June 1688, which overthrew a great number of the houses; and the rock opening where the castle stood, swallowed it up, and no less than 5000 persons perished on this occasion.

In the year 1758, so desolating a plague raged here, that scarcely a sufficient number of the inhabitants survived to gather in the fruits of the earth. In the year 1772, three-fourth parts of the city were consumed by fire; and six years after it was visited by the most dreadful earthquakes, which continued from the 25th of June to the 5th of July; by which successive calamities the city has been so much reduced, that its former consequence is never likely to be restored.

The ladies here wear the oriental dress, consisting of large trowsers or breeches, which reach to the ancle; long vests of rich silk or velvet, lined in winter with costly furs; and round their waist an embroidered zone with clasps of silver or gold. Their hair is plaited, and descends down the back often in great profusion. The girls have sometimes above twenty thick tresses, besides two or three encircling the head as a coronet, and set off with flowers and plumes of feathers, pearls, or other jewels. They commonly stain it of a chesnut colour, which is the most desired. Their apparel and carriage are alike antique. It is remarkable that the trowsers are mentioned in a fragment of Sappho as part of the female dress.

SMYRNIUM, ALEXANDERS; a genus of plants belonging to the class of pentandria, and to the order of digynia; and in the natural system ranging under the 45th order, *Umbellatæ*. See BOTANY *Index*.

SNAFFLE, in the manege, is a very slender bitmouth without any branches, much used in England; the true bridles being reserved for war.

SNAIL, in *Zoology*. See HELIX, CONCHOLOGY *Index*, and LIMAX, HELMINTHOLOGY *Index*.

SNAKE, in *Zoology*. See ANGUIS and SERPENS, OPHIOLOGY *Index*.

SNAKE-Stones, *Ammonitæ*, in *Natural History*, the name of a large genus of fossil shells, very few if any of which are yet known in their recent state, or living either on our own or any other shores; so that it seems wonderful whence so vast a number and variety of them should be brought into our subterranean regions. They seem indeed dispersed in great plenty throughout the world, but nowhere are found in greater numbers, beauty, and variety, than in our island.

Mr Harenberg found prodigious numbers of them on the banks of a river in Germany. He traced this river through its several windings for many miles, and among a great variety of belemnitæ, cornua ammonis, and cochlitæ, of various kinds; he found also great quantities of wood of recent petrifaction, which still preserved plain marks of the axe by which it had been cut from the trees then growing on the shore. The water of this river he found in dry seasons, when its natural springs were not diluted with rains, to be considerably heavier than common water; and many experiments showed him that it contained ferruginous, as well as stony particles, in great quantity, whence the petrifactions in it appeared the less wonderful, though many of them of recent date.

Of the cornua ammonis, or serpent-stones, he there observed more than 30 different species. They lie immersed in a bluish fossil stone, of a soft texture and fatty appearance, in prodigious numbers, and of a great variety of sizes, from the larger known sorts down to such as could not be seen without very accurate inspection or the assistance of a microscope. Such as lie in the softest of these stones are soft like their matrix, and easily crumble to pieces; others are harder. In a piece of this stone, of the bigness of a finger, it is common to find 30 or more of these fossils; and often they are seen only in form of white specks, so minute that their figure cannot be distinguished till examined by the microscope.

They all consist of several volutæ, which are different in number in the different species, and their striæ also are extremely various; some very deep with very high ridges between them, others very slight; some straight, others crooked; others undulated, and some terminating in dots, tubercles, or cavities, towards the back, and others having tubercles in two or three places. They are all composed of a great number of chambers or cells, in the manner of the *nautilus Græcorum*, each having a communication with the others, by means of a pipe or siphunculus. There is a small white shell fish of Barbadoes, which seems truly a recent animal of this genus; and in the East Indies there is another also, small and grayish; but the large and beautifully marked ones are found only fossil.

They are composed of various fossil bodies, often of quarry stone, sometimes of the matter of the common pyrites, and of a great variety of other substances; and though they appear usually mere stones, yet in some the pearly part of the original shell is preserved in all its beauty. Sometimes also, while the outer substance is of the matter of the pyrites, or other coarse, stony, or mineral matter, the inner cavity is filled with a pure white spar of the common plated texture. This gives a great beauty to the specimen. The cornua ammonis, or snake-stones, are found in many parts of England, particularly in Yorkshire, where they are very plentiful in the alum rocks of several sizes.

SNAPEDRAGON. See ANTIRRHINUM, BOTANY *Index*.

SNEEZING, a convulsive motion of the muscles of the breast, whereby the air is expelled from the nose with much vehemence and noise. It is caused by the irritation of the upper membrane of the nose, occasioned by acrid substances floating in the air, or by medicines called *sternutatory*.

This irritation is performed either externally, by strong smells, as marjoram, roses, &c. or by dust floating in the air, and taken in by inspiration; or by sharp pungent medicines, as cresses and other sternutatories, which vellicate the membrane of the nose; or internally, by the acrimony of the lympha or mucus, which naturally moistens that membrane. The matters cast forth in sneezing come primarily from the nose and throat; the pituitary membrane continually exuding a mucus thither; and, secondarily, from the breast, the trachea, and the bronchia of the lungs.

The practice of saluting the person who sneezed existed in Africa, among nations unknown to the Greeks and Romans. The accounts we have of Monomotapa inform us *, that when the prince sneezes, all his subjects in the capital are advertised of it, that they may offer up prayers for his safety. The author of the conquest of Peru assures us, that the cacique of Guachoia having sneezed in presence of the Spaniards, the Indians of his train fell prostrate before him, stretched forth their hands, and displayed to him the accustomed marks of respect, while they invoked the sun to enlighten him, to defend him, and to be his constant guard.

* *Strada, Prol. Acad.*

Every body knows that the Romans saluted each other on these occasions: and Pliny relates †, that Tiberius exacted these signs of homage when drawn in his chariot. Superstition, whose influence can debase every thing, had degraded this custom for several ages, by attaching favourable or unfavourable omens to sneezing according to the hour of the day or night, according to the signs of the zodiac, according as a work was more or less advanced, or according as one had sneezed to the right or to the left ‡. If a man sneezed at rising from table or from his bed, it was necessary for him to sit or lie down again. You are struck with astonishment, said Timotheus to the Athenians, who wished to return into the harbour with their fleet §, because he had sneezed; you are struck with astonishment, because among 10,000 there is one man whose brain is moist.

† *Plin. Hist. Nat.* lib. ii. cap. 2.

‡ *Spond. Homeri Comment.*

§ *Frontin.* lib. i. cap. 11.

Polydore Virgil pretends, that in the time of Gregory the Great, there reigned in Italy an epidemic distemper, which carried off by sneezing all those who were seized by it; and that this pontiff ordered prayers to be made against it, accompanied by certain signs of the cross. But besides that, there are very few cases in which sneezing can be considered as dangerous, and that it is frequently a favourable symptom ||: it is evident, that we ought not to date from the sixth century the origin of a custom which loses itself in the obscurity of antiquity. Avicenna and Cardan say, it is a sort of convulsion, which gives occasion to dread an epilepsy, and that

|| *Hippocrat. Halleri Phys.*

that this disease is endeavoured to be warded off by prayers. Clement of Alexandria considers it as a mark of intemperance and effeminacy, which ought to be proscribed. And he inveighs bitterly against those who endeavour to procure sneezing by external aid. Montaigne, on the contrary, explains this fact in a tone rather cynical. It is singular enough, that so many ridiculous, contradictory, and superstitious opinions, have not abolished those customary civilities which are still preserved equally among high and low; and which only the Anabaptists and Quakers have rejected, because they have renounced salutations in every case.

Among the Greeks sneezing was almost always a good omen. It excited marks of tenderness, of respect, and attachment. The genius of Socrates informed him by sneezing, when it was necessary to perform any action *. The young Parthenis, hurried on by her passion, resolved to write to Sarpedon an avowal of her love †; she sneezes in the most tender and impassioned part of her letter: This is sufficient for her; this incident supplies the place of an answer, and persuades her that Sarpedon is her lover. Penelope, harassed by the vexatious courtship of her suitors, begins to curse them all, and to pour forth vows for the return of Ulysses ‡. Her son Telemachus interrupts her by a loud sneeze. She instantly exults with joy, and regards this sign as an assurance of the approaching return of her husband. Xenophon was haranguing his troops; a soldier sneezed in the moment when he was exhorting them to embrace a dangerous but necessary resolution. The whole army, moved by this presage, determine to pursue the project of their general; and Xenophon orders sacrifices to Jupiter the preserver §.

* Plutarch de gen. Socrat.

† Aristenæt.

‡ Homeri Odyss. lib. xvii.

§ Xenoph. Anab.

This religious reverence for sneezing, so ancient and so universal even in the times of Homer, always excited the curiosity of the Greek philosophers and of the rabbins. These last have spread a tradition, that, after the creation of the world, God made a general law to this purport, that every living man should sneeze but once in his life, and that at the same instant he should render up his soul into the hand of his Creator ‖, without any preceding indisposition. Jacob obtained an exemption from the common law, and the favour of being informed of his last hour: He sneezed and did not die; and this sign of death was changed into a sign of life. Notice of this was sent to all the princes of the earth; and they ordained, that in future sneezing should be accompanied with forms of blessing, and vows for the persons who sneezed.

‖ Acad. des Inscrip. vol. iv.

Aristotle remounts likewise to the sources of natural religion. He observes, that the brain is the origin of the nerves, of our sentiments, our sensations, the seat of the soul, the image of the Divinity *; that upon all these accounts, the substance of the brain has ever been held in honour; that the first men swore by their head; that they durst not touch nor eat the brains of any animal; that it was even a sacred word which they dared not to pronounce. Filled with these ideas, it is not wonderful that they extended their reverence even to sneezing. Such is the opinion of the most ancient and sagacious philosophers of Greece.

* Aristot. in Prob.

According to mythology, the first sign of life Prometheus's artificial man gave was by sternutation. This supposed creator is said to have stolen a portion of the solar rays; and filling with them a phial, which he had made on purpose, sealed it up hermetically. He instantly flies back to his favourite automaton, and opening the phial holds it close to the statue; the rays still retaining all their activity, insinuate themselves through the pores, and set the fictitious man a sneezing. Prometheus, transported with the success of his machine, offers up a fervent prayer, with wishes for the preservation of so singular a being. His automaton observed him, remembering his ejaculations, was very careful, on the like occasions, to offer these wishes in behalf of his descendants, who perpetuated it from father to son in all their colonies.

SNIGGLING, a method of fishing for eels, chiefly used in the day-time, when they are found to hide themselves near wears, mills, or flood-gates. It is performed thus: Take a strong line and hook, baited with a garden-worm, and observing the holes where the eels lie hid, thrust your bait into them by the help of a stick; and if there be any, you shall be sure to have a bite; and may, if your tackling hold, get the largest eels.

SNIPE, in *Ornithology*. See Scolopax and Shooting.

SNORING, in *Medicine*, otherwise called *stertor*, is a sound like that of the cerchnon, but greater and more manifest.

Many confound those affections, and make them to differ only in place and magnitude, calling by the name of *stertor* that sound or noise which is heard or supposed to be made in the passage between the palate and the nostrils as in those who sleep; that boiling or bubbling noise, which in respiration proceeds from the larynx or head, or orifice of the aspera arteria, they call *cerchon*; but if the sound comes from the aspera arteria itself, it is called *cerchnos*, that is, as some understand it, a rattling, or as others a stridulous or wheezing roughness of the aspera arteria. In dying persons this affection is called by the Greeks ῥεγχος, *rhenchos*, which is a snoring or rattling kind of noise, proceeding as it were from a conflict between the breath and the humours in the aspera arteria.

This and such like affections are owing to a weakness of nature, as when the lungs are full of pus or humours: to which purpose we read in the Prognostics of Hippocrates, "it is a bad sign when there is no expectoration, and no discharge from the lungs, but a noise as from an ebullition is heard in the aspera arteria from a plenitude of humour." Expectoration is suppressed either by the viscidity of the humour, which requires to be discharged, and which adhering to the aspera arteria, and being there agitated by the breath, excites that bubbling noise or stertor; or by an obstruction of the bronchia; or, lastly, by a compression of the aspera arteria and throat, whence the passage is straitened, in which the humours being agitated, excite such a kind of noise as before described. Hence Galen calls those who are strait-breasted *stertorous*. That author assigns but two causes of this symptom, which are either the straitness of the passage of respiration or redundance of humours, or both together; but it is necessary to add a third, to wit, the weakness of the faculty, which is the cause of the rhenchos in dying persons, where nature is too weak to make discharges.

From what has been said we conclude, that this symptom, or this sort of fervour or ebullition in the throat,

throat, is not always mortal, but only when nature is oppreſſed with the redundance of humour, in ſuch a manner, that the lungs cannot diſcharge themſelves by ſpitting; or the paſſage appointed for the breath (being the aſpera arteria) is very much obſtructed, upon which account many dying perſons labour under a ſtertor with their mouths gaping.

SNOW, a well known meteor, formed by the freezing of the vapour of water in the atmoſphere. It differs from hail and hoar-froaſt, in being as it were cryſtallized, which they are not. This appears on examining a flake of ſnow by a magnifying glaſs; when the whole of it will appear to be compoſed of fine ſhining ſpicula diverging like rays from a centre. As the flakes fall down through the atmoſphere, they are continually joined by more of theſe radiated ſpicula, and thus increaſe in bulk like the drops of rain or hailſtones. Dr Grew, in a diſcourſe of the nature of ſnow, obſerves, that many parts thereof are of a regular figure, for the moſt part ſtars of ſix points, and are as perfect and tranſparent ice as any we ſee on a pond, &c. Upon each of theſe points are other collateral points, ſet at the ſame angles as the main points themſelves: among which there are divers other irregular, which are chiefly broken points, and fragments of the regular ones. Others alſo, by various winds, ſeem to have been thawed and frozen again into irregular cluſters; ſo that it ſeems as if the whole body of ſnow were an infinite maſs of icicles irregularly figured. That is, a cloud of vapours being gathered into drops, the ſaid drops forthwith deſcend; upon which deſcent, meeting with a freezing air as they paſs through a colder region, each drop is immediately frozen into an icicle, ſhooting itſelf forth into ſeveral points; but theſe ſtill continuing their deſcent, and meeting with ſome intermitting gales of warmer air, or in their continual waftage to and fro touching upon each other, ſome of them are a little thawed, blunted, and again frozen into cluſters, or entangled ſo as to fall down in what we call *flakes*.

The lightneſs of ſnow, although it is firm ice, is owing to the exceſs of its ſurface, in compariſon to the matter contained under it; as gold itſelf may be extended in ſurface till it ride upon the leaſt breath of air.

The whiteneſs of ſnow is owing to the ſmall particles into which it is divided; for ice, when pounded, will become equally white. An artificial ſnow has been made by the following experiment. A tall phial of aquafortis being placed by the fire till it is warm, and filings of pure ſilver, a few at a time, being put into it; after a briſk ebullition, the ſilver will diſſolve ſlowly. The phial being then placed in a cold window, as it cools the ſilver particles will ſhoot into cryſtals, ſeveral of which running together will form a flake of ſnow, which will deſcend to the bottom of the phial. While they are deſcending, they repreſent perfectly a ſhower of ſilver ſnow, and the flakes will lie upon one another at the bottom, like real ſnow upon the ground.

According to Signior Beccaria, clouds of ſnow differ in nothing from clouds of rain, but in the circumſtance of cold that freezes them. Both the regular diffuſion of the ſnow, and the regularity of the ſtructure of its parts (particularly ſome figures of ſnow or hail which fall about Turin, and which he calls *roſette*), ſhow that clouds of ſnow are acted upon by ſome uniform cauſe like electricity; and he endeavours to ſhow how electricity is capable of forming theſe figures. He was confirmed in his conjectures by obſerving, that his apparatus for obſerving the electricity of the atmoſphere never failed to be electrified by ſnow as well as rain. Profeſſor Winthrop ſometimes found his apparatus electrified by ſnow when driven about by the wind, though it had not been affected by it when the ſnow itſelf was falling. A more intenſe electricity, according to Beccaria, unites the particles of hail more cloſely than the more moderate electricity does thoſe of ſnow, in the ſame manner as we ſee that the drops of rain which fall from thunder-clouds are larger than thoſe which fall from others, though the former deſcend through a leſs ſpace.

But we are not to conſider ſnow merely as a curious and beautiful phenomenon. The Great Diſpenſer of univerſal bounty has ſo ordered it, that it is eminently ſubſervient, as well as all the works of creation, to his benevolent deſigns. Were we to judge from appearances only, we might imagine, that ſo far from being uſeful to the earth, the cold humidity of ſnow would be detrimental to vegetation. But the experience of all ages aſſerts the contrary. Snow, particularly in thoſe northern regions where the ground is covered with it for ſeveral months, fructifies the earth, by guarding the corn or other vegetables from the intenſer cold of the air, and eſpecially from the cold piercing winds. It has been a vulgar opinion, very generally received, that ſnow fertilizes the lands on which it falls more than rain, in conſequence of the nitrous ſalts which it is ſuppoſed to acquire by freezing. But it appears from the experiments of Margraaf, in the year 1751, that the chemical difference between rain and ſnow water is exceedingly ſmall; that the latter contains a leſs proportion of earth than the former; but neither of them contain either earth or any kind of ſalt in any quantity which can be ſenſibly efficacious in promoting vegetation. Allowing, therefore, that nitre is a fertilizer of lands, which many are upon good grounds diſpoſed utterly to deny, yet ſo very ſmall is the quantity of it contained in ſnow, that it cannot be ſuppoſed to promote the vegetation of plants upon which the ſnow has fallen. The peculiar agency of ſnow, as a fertilizer in preference to rain, may admit of a very rational explanation, without recurring to nitrous ſalts ſuppoſed to be contained in it. It may be rationally aſcribed to its furniſhing a covering to the roots of vegetables, by which they are guarded from the influence of the atmoſpheric cold, and the internal heat of the earth is prevented from eſcaping.

The internal part of the earth, by ſome principle which we do not underſtand, is heated uniformly to the 48th degree of Fahrenheit's thermometer. This degree of heat is greater than that in which the watery juices of vegetables freeze, and it is propagated from the inward parts of the earth to the ſurface, on which the vegetables grow. The atmoſphere being variably heated by the action of the ſun in different climates, and in the ſame climate at different ſeaſons, communicates to the ſurface of the earth and to ſome diſtance below it the degree of heat or cold which prevails in itſelf. Different vegetables are able to preſerve life under different degrees of cold, but all of them periſh when the cold which reaches their roots is extreme. Providence has therefore, in the coldeſt climates, provided a covering

Snow.

of snow for the roots of vegetables, by which they are protected from the influence of the atmospherical cold. The snow keeps in the internal heat of the earth, which surrounds the roots of vegetables, and defends them from the cold of the atmosphere.

Snow or ice water is always deprived of its fixed air, which escapes during the process of congelation. Accordingly, as some of the inhabitants of the Alps who use it for their constant drink have enormous wens upon their throats, it has been ascribed to this circumstance. If this were the cause of these wens, it would be easy to remove it by exposing the snow-water to the air for some time. But several eminent physicians have rejected the notion that snow-water is the cause of these wens; for in Greenland, where snow-water is commonly used, the inhabitants are not affected with such swellings: on the other hand, they are common in Sumatra where snow is never seen.

SNOW, in sea affairs, is generally the largest of all two-masted vessels employed by Europeans, and the most convenient for navigation.

The sails and rigging on the mainmast and foremast of a snow are exactly similar to those on the same masts in a ship; only that there is a small mast behind the mainmast of the former, which carries a sail nearly resembling the mizen of a ship. The root of the mast is fixed on a block of wood on the quarter-deck abaft the mainmast; and the head of it is attached to the aftertop of the maintop. The sail which is called the *trysail* is extended from its mast towards the stern of the vessel.

When the sloops of war are rigged as snows, they are furnished with a horse, which answers the purpose of the trysail-mast, the fore-part of the sail being attached by rings to the said horse, in different parts of its height.

SNOW Grotto, an excavation made by the waters on the side of Mount Etna, by making their way under the layers of lava, and by carrying away the bed of pozzolana below them. It occurred to the proprietor, that this place was very suitable for a magazine of snow: for in Sicily, at Naples, and particularly at Malta, they are obliged for want of ice to make use of snow for cooling their wine, sherbet, and other liquors, and for making sweetmeats.

This grotto was hired or bought by the knights of Malta, who having neither ice nor snow on the burning rock which they inhabit, have hired several caverns on Etna, into which people whom they employ collect and preserve quantities of snow to be sent to Malta when needed. The grotto has therefore been repaired within at the expence of that order; flights of steps are cut into it, as well as two openings from above, by which they throw in the snow, and through which the grotto is enlightened. Above the grotto they have also levelled a piece of ground of considerable extent: this they have inclosed with thick and lofty walls, so that when the winds, which at this elevation blow with great violence, carry the snow from the higher parts of the mountains, and deposit it in the inclosure, it is retained and amassed by the walls. The people then remove it into the grotto through the two openings; and it is there laid up, and preserved in such a manner as to resist the force of the summer heats; as the layers of lava with which the grotto is arched above prevent them from making any impression.

Snow, Snowdon-Hill.

When the season for exporting the snow comes on, it is put into large bags, into which it is pressed as closely as possible; it is then carried by men out of the grotto, and laid upon mules, which convey it to the shore, where small vessels are waiting to carry it away.

But before those lumps of snow are put into bags, they are wrapped in fresh leaves; so that while they are conveyed from the grotto to the shore, the leaves may prevent the rays of the sun from making any impression upon them.

The Sicilians carry on a considerable trade in snow, which affords employment to some thousands of mules, horses, and men. They have magazines of it on the summits of their loftiest mountains, from which they distribute it through all their cities, towns, and houses; for every person in the island makes use of snow. They consider the practice of cooling their liquors as absolutely necessary for the preservation of health; and in a climate the heat of which is constantly relaxing the fibres, cooling liquors, by communicating a proper tone to the fibres of the stomach, must greatly strengthen them for the performance of their functions.

In this climate a scarcity of snow is no less dreaded than a scarcity of corn, wine, or oil. We are informed by a gentleman who was at Syracuse in the year 1777, when there was a scarcity of snow, the people of the town learned that a small vessel loaded with that article was passing the coast: without a moment's deliberation they ran in a body to the shore, and demanded her cargo; which when the crew refused to deliver up, the Syracusans attacked and took, though with the loss of several men.

SNOW-Drop. See CHIONANTHUS, BOTANY *Index*.

SNOWDON HILL, the name of a mountain in Caernarvon-shire in Wales, generally thought to be the highest in Britain; though some have been of opinion that its height is equalled, or even exceeded, by mountains in the Highlands of Scotland. The mountain is surrounded by many others, called in the Welsh language *Crib Coch*, *Crib y Distill*, *Lliweddy yr Arran*, &c.

According to Mr Pennant *, this mountainous tract yields scarcely any corn. Its produce is cattle and sheep; which, during summer, keep very high in the mountains, followed by their owners with their families, who reside during that season in *havodtys*, or "summer dairy-houses," as the farmers in the Swiss Alps do in their *sennes*. These houses consist of a long low room, with a hole at one end to let out the smoke from the fire which is made beneath. Their furniture is very simple; stones are substituted for stools, and their beds are of hay, ranged along the sides. They manufacture their own clothes, and dye them with the *lichen omphaloides* and *lichen parietinus*, mosses collected from the rocks. During summer the men pass their time in tending their herds or in making hay, &c. and the women in milking or in making butter and cheese. For their own use they milk both ewes and goats, and make cheese of the milk. Their diet consists of milk, cheese, and butter; and their ordinary drink is whey; though they have, by way of reserve, a few bottles of very strong beer, which they use as a cordial when sick. They are people of good understanding, wary, and circumspect; tall,

* *Journey to Snowdon.*

th

thin, and of ſtrong conſtitutions. In the winter-time they deſcend into the *hen dref*, or "old dwelling," where they paſs their time in inactivity.

The view from the higheſt peak of Snowdon is very extenſive. From it Mr Pennant ſaw the county of Cheſter, the high hills of Yorkſhire, part of the north of England, Scotland, and Ireland; a plain view of the iſle of Man; and that of Angleſea appeared like a map extended under his feet, with every rivulet viſible. Our author took much pains to have this view to advantage; ſat up at a farm on the weſt till about 12, and walked up the whole way. The night was remarkably fine and ſtarry; towards morning the ſtars faded away, leaving an interval of darkneſs, which, however, was ſoon diſpelled by the dawn of day. The body of the ſun appeared moſt diſtinct, with the roundneſs of the moon, before it appeared too brilliant to be looked at. The ſea, which bounded the weſtern part of the proſpect, appeared gilt with the ſun-beams, firſt in ſlender ſtreaks, and at length glowed with redneſs. The proſpect was diſcloſed like the gradual drawing up of a curtain in a theatre; till at laſt the heat became ſufficiently ſtrong to raiſe miſts from the various lakes, which in a ſlight degree obſcured the proſpect. The ſhadow of the mountain extended many miles, and ſhowed its bicapitated form; the Wyddfa making one head, and Crib y Diſtill the other. At this time he counted between 20 and 30 lakes either in Caernarvon or in Merionethſhire. In making another viſit, the ſky was obſcured very ſoon after he got up. A vaſt miſt involved the whole circuit of the mountain, and the proſpect down was horrible. It gave an idea of numbers of abyſſes, concealed by a thick ſmoke furiouſly circulating around them. Very often a guſt of wind made an opening in the clouds, which gave a fine and diſtinct viſta of lake and valley. Sometimes they opened in one place, at others in many at once; exhibiting a moſt ſtrange and perplexing ſight of water, fields, rocks, and chaſms. They then cloſed again, and every thing was involved in darkneſs; in a few minutes they would ſeparate again, and repeat the above-mentioned ſcene with infinite variety. From this proſpect our traveller deſcended with great reluctance; but before he had reached the place where his horſes were left, he was overtaken by a thunder ſtorm. The rolling of the thunder-claps, being reiterated by the mountains, was inexpreſſibly awful; and after he had mounted, he was in great danger of being ſwept away by the torrents which poured down in conſequence of a very heavy rain.

It is very rare (Mr Pennant obſerves) that the traveller gets a proper day to aſcend this hill: it indeed often appears clear; but by the evident attraction of the clouds by this lofty mountain, it becomes ſuddenly and unexpectedly enveloped in miſt, when the clouds have juſt before appeared very high and very remote. At times he obſerved them lower to half their height; and notwithſtanding they have been diſperſed to the right and left, yet they have met from both ſides, and united to involve the ſummit in one great obſcurity.

The height of Snowdon was meaſured, in 1682, by Mr Caſwell, with inſtruments made by Flamſtead: according to his menſuration, the height is 3720 feet; but more modern computations make it only 3568, reckoning from the quay at Caernarvon to the higheſt peak. The ſtone that compoſes this mountain is exceſſively hard. Large coarſe cryſtals, and frequently cubic pyrites, are found in the fiſſures. An immenſe quantity of water ruſhes down the ſides of Snowdon and the neighbouring mountains, inſomuch that Mr Pennant ſuppoſes, if collected into one ſtream, they would exceed the waters of the Thames.

SNUFF, a powder chiefly made of tobacco, the uſe of which is too well known to need any deſcription here.

Tobacco is uſually the baſis of ſnuff; other matter being only added to give it a more agreeable ſcent, &c. The kinds of ſnuff, and their ſeveral names, are infinite, and new ones are daily invented; ſo that it would be difficult, not to ſay impoſſible, to give a detail of them. We ſhall only ſay, that there are three principal ſorts: the firſt granulated; the ſecond an impalpable powder; and the third the bran, or coarſe part remaining after ſifting the ſecond ſort.

"Every profeſſed, inveterate, and incurable ſnuff-taker (ſays Lord Stanhope), at a moderate computation, takes one pinch in ten minutes. Every pinch, with the agreeable ceremony of blowing and wiping the noſe and other incidental circumſtances, conſumes a minute and a half. One minute and a half out of every ten, allowing 16 hours to a ſnuff-taking day, amounts to two hours and 24 minutes out of every natural day, or one day out of every ten. One day out of every 10 amounts to 36 days and a half in a year. Hence if we ſuppoſe the practice to be perſiſted in 40 years, two entire years of the ſnuff-taker's life will be dedicated to tickling his noſe, and two more to blowing it. The expence of ſnuff, ſnuff boxes, and handkerchiefs, will be the ſubject of a ſecond eſſay; in which it will appear, that this luxury encroaches as much on the income of the ſnuff-taker as it does on his time; and that by a proper application of the time and money thus loſt to the public, a fund might be conſtituted for the diſcharge of the national debt." See NICOTIANA.

SNYDERS, FRANCIS, a Flemiſh painter, born at Antwerp in 1579, and bred under his countryman Henry Van Balen. His genius firſt diſplayed itſelf in painting fruit: he afterwards attempted animals, huntings, &c. in which he exceeded all his predeceſſors. He alſo painted kitchens, &c. and gave dignity to ſubjects that ſeemed incapable of it. He was made painter to Ferdinand and Iſabella, archduke and ducheſs, and became attached to the houſe of the cardinal infant of Spain. The king of Spain and the elector Palatine adorned their palaces with huntings by this artiſt. Rubens, Jordaens, and Snyders, uſed to co-operate in the enriching of each other's pictures according to their ſeveral talents; and thus they became more valuable than if finiſhed by either of them ſingly. Snyders died in 1657.

SOAL-FISH. See PLEURONECTES, ICHTHYOLOGY *Index*.

SOAP, a compoſition of cauſtic, fixed alkaline ſalt, and oil, ſometimes hard and dry, ſometimes ſoft and liquid; much uſed in waſhing, whitening linens, and by dyers and fullers.—Soap may be made by ſeveral methods, which, however, all depend upon the ſame principle. The ſoap which is uſed in medicine is made without heat.

In manufactures where large quantities of it are prepared, ſoap is made with heat. A lixivium of quicklime and

and soda is made, but is less concentrated than that above referred to, and only so much that it can sustain a fresh egg. A part of this lixivium is to be even diluted and mixed with an equal weight of oil of olives. The mixture is to be put on a gentle fire, and agitated, that the union may be accelerated. When the mixture begins to unite well, the rest of the lixivium is to be added to it; and the whole is to be digested with a very gentle heat, till the soap be completely made. A trial is to be made of it, to examine whether the just proportion of oil and alkali has been observed. Good soap of this kind ought to be firm, and very white when cold; not subject to become moist by exposure to air, and entirely miscible with pure water, to which it communicates a milky appearance, but without any drops of oil floating on the surface. When the soap has not these qualities, the combination has not been well made, or the quantity of salt or oil is too great, which faults must be corrected.

In soft or liquid soaps, green or black soaps, cheaper oils are employed, as oil of nuts, of hemp, of fish, &c. These soaps, excepting in consistence, are not essentially different from white soap.

Fixed alkalies are much disposed to unite with oils that are not volatile, both vegetable and animal, since this union can be made even without heat. The compound resulting from this union partakes at the same time of the properties of oil and of alkali; but these properties are modified and tempered by each other, according to the general rule of combinations. Alkali formed into soap has not nearly the same acrimony as when it is pure; it is even deprived of almost all its causticity, and its other saline alkaline properties are almost entirely abolished. The same oil contained in soap is less combustible than when pure, from its union with the alkali, which is an uninflammable body. It is miscible, or even soluble, in water, to a certain degree, by means of the alkali. Soap is entirely soluble in spirit of wine; and still better in aquavitæ sharpened by a little alkaline salt, according to an observation of Mr Geoffroy.

The manufacture of soap in London first began in the year 1524; before which time this city was served with white soap from foreign countries, and with gray soap speckled with white from Bristol, which was sold for a penny a pound; and also with black soap, which sold for a halfpenny the pound.

The principal soaps of our own manufacture are the soft, the hard, and the ball soap. The soft soap is either white or green. The process of making each of these shall now be described.

Green soft soap. The chief ingredients used in making this are lees drawn from pot-ash and lime, boiled up with tallow and oil. First, the ley of a proper degree of strength (which must be estimated by the weight of the liquor), and tallow, are put into the copper together, and as soon as they boil up the oil is added; the fire is then damped or stopped up, while the ingredients remain in the copper to unite; when they are united, the copper is again made to boil, being fed or filled with lees as it boils, till there be a sufficient quantity put into it; then it is boiled off and put into casks. When this soap is first made it appears uniform; but in about a week's time the tallow separates from the oil into those white grains which we see in common soap. Soap thus made would appear yellow, but by a mixture of indigo added at the end of the boiling, it is rendered green, that being the colour which results from the mixture of yellow and blue.

White soap. Of this one sort is made after the same manner as green soft soap, oil alone excepted, which is not used in white. The other sort of white soft soap is made from the lees of ashes of lime boiled up two different times with tallow. First, a quantity of lees and tallow are put into the copper together, and kept boiling, being fed with lees as they boil, until the whole is boiled sufficiently; then the lees are separated or discharged from the tallowish part, which part is removed into a tub, and the lees are thrown away; this is called the *first half-boil:* then the copper is filled again with fresh tallow and lees, and the first half-boil is put out of the tub into the copper a second time, where it is kept boiling with fresh lees and tallow till the soap is produced. It is then put out of the copper into the same sort of casks as are used for green soft soap. The common soft soap used about London, generally of a greenish hue, with some white lumps, is prepared chiefly with tallow: a blackish sort, more common in some other places, is said to be made with whale oil.

Hard soap is made with lees from ashes and tallow, and is most commonly boiled twice: the first, called the *half-boil*, hath the same operation as the first half-boil of soft white soap. Then the copper is charged with fresh lees again, and the first half boil put into it, where it is kept boiling, and fed with lees as it boils, till it grains or is boiled enough: then the ley is discharged from it, and the soap put into a frame to cool and harden. Common salt is made use of for the purpose of graining the soap; for when the oil or tallow has been united with the ley, after a little boiling, a quantity of salt is thrown into the mass, which dissolving readily in water, but not in the oil or tallow, draws out the water in a considerable degree, so that the oil or tallow united with the salt of the ley swims on the top. When the ley is of a proper strength, less salt is necessary to raise the curd than when it is too weak. It must be observed, that there is no certain time for bringing off a boiling of any of these sorts of soap: it frequently takes up part of two days.

Ball soap, commonly used in the north, is made with lees from ashes and tallow. The lees are put into the copper, and boiled till the watery part is quite gone, and there remains nothing in the copper but a sort of saline matter (the very strength or essence of the ley); to this the tallow is put, and the copper is kept boiling and stirring for above half an hour, in which time the soap is made; and then it is put out of the copper into tubs or baskets with sheets in them, and immediately (whilst soft) made into balls. It requires near 24 hours in this process to boil away the watery part of the ley.

When oil unites with alkali in the formation of soap, it is little altered in the connection of its principles; for it may be separated from the alkali by decomposing soap with any acid, and may be obtained nearly in its original state.

Concerning the decomposition of soap by means of acids, we must observe, first, that all acids, even the weakest vegetable acids, may occasion this decomposition, because every one of them has a greater affinity than

than oil with fixed alkali. Secondly, these acids, even when united with any basis, excepting fixed alkali, are capable of occasioning the same decomposition; whence all ammoniacal salts, all salts with bases of earth, and all those with metallic bases, are capable of decomposing soap, in the same manner as disengaged acids are; with this difference, that the oil separated from the fixed alkali, by the acid of these salts, may unite more or less intimately with the substance which was the basis of the neutral salt employed for the decomposition.

Soap may also be decomposed by distillation, as Lemery has done. When first exposed to fire, it yields a phlegm called by him a *spirit;* which nevertheless is neither acid nor alkaline, but some water which enters into the composition of soap. It becomes more and more coloured and empyreumatic as the fire is increased, which shows that it contains the most subtle part of the oil. It seems even to raise along with it, by help of the oil and action of the fire, a small part of the alkali of the soap: for as the same chemist observes, it occasions a precipitate in a solution of corrosive sublimate. After this phlegm the oil rises altered, precisely as if it had been distilled from quicklime, that is, empyreumatic, soluble in spirit of wine, at first sufficiently subtle and afterwards thicker. An alkaline residuous coal remains in the retort, consisting chiefly of the mineral alkali contained in the soap, and which may be disengaged from the coal by calcination in an open fire, and obtained in its pure state.

Alkaline soaps are very useful in many arts and trades, and also in chemistry and medicine. Their principal utility consists in a detersive quality that they receive from their alkali, which, although it is in some measure saturated with oil, is yet capable of acting upon oily matters, and of rendering them saponaceous and miscible with water. Hence soap is very useful to cleanse any substances from all fat matters with which they happen to be soiled. Soap is therefore daily used for the washing and whitening of linen, for the cleansing of woollen-cloths from oil, and for whitening silk and freeing it from the resinous varnish with which it is naturally covered. Pure alkaline lixiviums being capable of dissolving oils more effectually than soap, might be employed for the same purposes; but when this activity is not mitigated by oil, as it is in soap, they are capable of altering, and even of destroying entirely by their causticity, most substances, especially animal matters, as silk, wool, and others: whereas soap cleanses from oil almost as effectually as pure alkali, without danger of altering or destroying; which renders it very useful.

Woodville's Medical Botany, p. 390.

Soap was imperfectly known to the ancients. It is mentioned by Pliny as made of fat and ashes, and as an invention of the Gauls. Aretæus and others informs us, that the Greeks obtained their knowledge of its medical use from the Romans. Its virtues, according to Bergius, are detergent, resolvent, and aperient, and its use recommended in jaundice, gout, calculous complaints, and in obstructions of the viscera. The efficacy of soap in the first of these diseases was experienced by Sylvius, and since recommended very generally by various authors who have written on this complaint; and it has also been thought of use in supplying the place of bile in the primæ viæ. The utility of this medicine in icterical cases was inferred chiefly from its supposed power of dissolving biliary concretions; but this medicine has lost much of its reputation in jaundice, since it is now known that gall-stones have been found in many after death who had been daily taking soap for several months and even years. Of its good effects in urinary calculous affections, we have the testimony of several, especially when dissolved in lime-water, by which its efficacy is considerably increased; for it thus becomes a powerful solvent of mucus, which an ingenious modern author supposes to be the chief agent in the formation of calculi; it is, however, only in the incipient state of the disease that these remedies promise effectual benefit; though they generally abate the more violent symptoms where they cannot remove the cause. With Boerhaave soap was a general medicine: for as he attributed most complaints to viscidity of the fluids, he, and most of the Boerhaavian school, prescribed it in conjunction with different resinous and other substances, in gout, rheumatism, and various visceral complaints. Soap is also externally employed as a resolvent, and gives name to several officinal preparations.

From the properties of soap we may know that it must be a very effectual and convenient anti-acid. It absorbs acids as powerfully as pure alkalies and absorbent earths, without having the causticity of the former, and without oppressing the stomach by its weight like the latter.

Lastly, we may perceive that soap must be one of the best of all antidotes to stop quickly, and with the least inconvenience, the bad effects of acid corrosive poisons, as aquafortis, corrosive sublimate, &c.

Soap imported is subject by 10 Ann. cap. 19. to a duty of 2d. a pound (over and above former duties); and by 12 Ann. stat. 2. cap. 9. to the farther sum of 1d. a pound. And by the same acts, the duty on soap made in the kingdom is 1½d. a pound. By 19 G. III. cap. 52. no person within the limits of the head office of excise in London shall be permitted to make any soap unless he occupy a tenement of 10l. a year, be assessed, and pay the parish rates; or elsewhere, unless he be assessed, and pay to church and poor. Places of making are to be entered on pain of 50l. and covers and locks to be provided under a forfeiture of 100l.; the furnace-door of every utensil used in the manufacture of soap shall be locked by the excise officer, as soon as the fire is damped or drawn out, and fastenings provided, under the penalty of 50l.; and opening or damaging such fastening incurs a penalty of 100l. Officers are required to enter and survey at all times, by day or night, and the penalty of obstructing is 20l.; and they may unlock and examine every copper, &c. between the hours of five in the morning and eleven in the evening, and the penalty of obstructing is 100l. Every maker of soap before he begins any making, if within the bills of mortality, shall give 12 hours, if elsewhere 24 hours, notice in writing to the officer, of the time when he intends to begin, on pain of 50l. No maker shall remove any soap unsurveyed on pain of 20l. without giving proper notice of his intention. And if any maker shall conceal any soap or materials, he shall forfeit the same, and also 500l. Every barrel of soap shall contain 256 lb. avoirdupois, half barrel 128 lb. firkin 64 lb. half-firkin 32 lb. besides the weight or tare of each cask: and all soap, excepting hard cake soap and ball soap, shall be put into such casks and no other, on pain of forfeiture, and 5l. The maker shall weekly

Soap ‖ Society.

weekly enter in writing at the next office the ſoap made by him in each week, with the weight and quantity at each boiling, on pain of 50l.; and within one week after entry clear off the duties, on pain of double duty. See, beſides the ſtatutes above cited, 5 Geo. III. cap. 43. 12 Geo III. cap. 46. 11 Geo. cap. 30. 1 Geo. ſtat. 2. cap. 36.

Acid SOAP. This is formed by the addition of concentrated acids to the expreſſed oils. Thus the oil is rendered partially ſoluble in water; but the union is not ſufficiently complete to anſwer any valuable purpoſe.

SOAPWORT. See SAPONARIA, BOTANY *Index.*

SOC (Sax.), ſignifies power or liberty to miniſter juſtice or execute laws; alſo the circuit or territory wherein ſuch power is exerciſed. Whence our law-Latin word *ſocca* is uſed for a ſeigniory or lordſhip enfranchiſed by the king, with the liberty of holding or keeping a court of his *ſockmen*: And this kind of liberty continues in divers parts of England to this day, and is known by the names of *ſoke* and *ſoken.*

SOCAGE, in its moſt general and extenſive ſignification, ſeems to denote a tenure by any certain and determinate ſervice. And in this ſenſe it is by our ancient writers conſtantly put in oppoſition to chivalry or knight-ſervice, where the render was precarious and uncertain. The ſervice muſt therefore be certain, in order to denominate it ſocage; as to hold by fealty and 20s. rent; or, by homage, fealty, and 20s. rent; or, by homage and fealty without rent; or, by fealty and certain corporal ſervice, as ploughing the lord's land for three days; or, by fealty only without any other ſervice: for all theſe are tenures in ſocage.

Blackſt. Comment. vol. ii.

Socage is of two ſorts: *free*-ſocage, where the ſervices are not only certain but honourable; and *villein*-ſocage, where the ſervices, though certain, are of a baſer nature (ſee VILLENAGE). Such as hold by the former tenure are called, in Glanvil and other ſubſequent authors, by the name of *liberi ſokemanni*, or tenants in free-ſocage. The word is derived from the Saxon appellation *ſoc*, which ſignifies liberty or privilege; and, being joined to an uſual termination, is called *ſocage*, in Latin *ſocagium;* ſignifying thereby a free or privileged tenure.

It ſeems probable that the ſocage-tenures were the relics of Saxon liberty; retained by ſuch perſons as had neither forfeited them to the king, nor been obliged to exchange their tenure for the more honourable, as it was called, but at the ſame time more burthenſome, tenure of knight-ſervice. This is peculiarly remarkable in the tenure which prevails in Kent, called *gavelkind*, which is generally acknowledged to be a ſpecies of ſocage-tenure; the preſervation whereof inviolate from the innovations of the Norman conquerer is a fact univerſally known. And thoſe who thus preſerved their liberties were ſaid to hold in free and common ſocage.

As therefore the grand criterion and diſtinguiſhing mark of this ſpecies of tenure are the having its renders or ſervices aſcertained, it will include under it all other methods of holding free lands by certain and invariable rents and duties; and in particular, *Petit SERJEANTY, Tenure in BURGAGE*, and GAVELKIND. See theſe articles.

1 Definition.

SOCIETY, a number of rational and moral beings, united for their common preſervation and happineſs.

2 How far brutes are capable of a ſocial ſtate.

There are ſhoals of fiſhes, herds of quadrupeds, and flocks of birds. But till obſervation enable us to determine with greater certainty, how far the inferior animals are able to look through a ſeries of means to the end which theſe are calculated to produce, how far their conduct may be influenced by the hope of reward and the fear of puniſhment, and whether they are at all capable of moral diſtinctions—we cannot with propriety apply to them the term *Society.* We call crows and beavers, and ſeveral other ſpecies of animals, *gregarious;* but it is hardly good Engliſh to ſay that they are *ſocial.*

3 Mankind the only ſocial beings ſubject to our obſervation.

It is only human ſociety, then, that can become the ſubject of our preſent inveſtigation. The phenomena which it preſents are highly worthy of our notice.

4 A ſocial and a ſavage ſtate.

Such are the advantages which each individual evidently derives from living in a ſocial ſtate; and ſo helpleſs does any human being appear in a ſolitary ſtate, that we are naturally led to conclude, that if there ever was a period at which mankind were ſolitary beings, that period could not be of long duration; for their averſion to ſolitude and love of ſociety would ſoon induce them to enter into ſocial union. Such is the opinion which we are led to conceive, when we compare our own condition as members of civilized and enlightened ſociety with that of the brutes around us, or with that of ſavages in the earlier and ruder periods of ſocial life. When we hear of Indians wandering naked through the woods, deſtitute of arts, unſkilled in agriculture, ſcarce capable of moral diſtinctions, void of all religious ſentiments, or poſſeſſed with the moſt abſurd notions concerning ſuperior powers, and procuring means of ſubſiſtence in a manner equally precarious with that of the beaſts of prey—we look down with pity on their condition, or turn from it with horror. When we view the order of cultivated ſociety, and conſider our inſtitutions, arts, and manners—we rejoice over our ſuperior wiſdom and happineſs.

Man in a civilized ſtate appears a being of a ſuperior order to man in a ſavage ſtate; yet ſome philoſophers tell us, that it is only he who, having been educated in ſociety, has been taught to depend upon others, that can be helpleſs or miſerable when placed in a ſolitary ſtate. They view the ſavage who exerts himſelf with intrepidity to ſupply his wants, or bears them with fortitude, as the greateſt hero, and poſſeſſing the greateſt happineſs. And therefore if we agree with them, that the propenſities of nature may have prompted men to enter into ſocial union, though they may have hoped to enjoy ſuperior ſecurity and happineſs by engaging to protect and ſupport each other, we muſt conclude that the Author of the univerſe has deſtined man to attain greater dignity and happineſs in a ſavage and ſolitary than in a ſocial ſtate; and therefore that thoſe diſpoſitions and views which lead us to ſociety are fallacious and inimical to our real intereſt.

Whatever be the ſuppoſed advantages of a ſolitary ſtate, certain it is that mankind, at the earlieſt periods, were united in ſociety. Various theories have been formed concerning the circumſtances and principles which gave riſe to this union: but we have elſewhere ſhown, that the greater part of them are founded in error; that they ſuppoſe the original ſtate of man to have been

been that of ſavages; and that ſuch a ſuppoſition is contradicted by the moſt authentic records of antiquity. For though the records of the earlier ages are generally obſcure, fabulous, and imperfect; yet happily there is *one* free from the imperfections of the reſt, and of undoubted authenticity, to which we may ſafely have recourſe *. This record is the Pentateuch of Moſes, which preſents us with a genuine account of the origin of man and of ſociety, perfectly conſonant to what we have laid down in the article referred to (ſee SAVAGE).

* See *Scripture*, N° 7—12.

5 First ſtate of ſociety according to authentic hiſtory.

According to Moſes, the firſt ſociety was that of a huſband and wife united in the bonds of marriage: the firſt government that of a father and huſband, the maſter of his family. Men lived together under the patriarchal form of government while they employed themſelves chiefly in tending flocks and herds. Children in ſuch circumſtances cannot ſoon riſe to an equality with their parents, where a man's importance depends on his property, not on his abilities. When flocks and herds are the chief articles of property, the ſon can only obtain theſe from his father; in general therefore the ſon muſt be entirely dependent on the father for the means of ſubſiſtence. If the parent during his life beſtow on his children any part of his property, he may do it on ſuch conditions as ſhall make their dependence upon him continue till the period of his death. When the community are by this event deprived of their head, inſtead of continuing in a ſtate of union, and ſelecting ſome one from among themſelves whom they may inveſt with the authority of a parent, they ſeparate into ſo many diſtinct tribes, each ſubjected to the authority of a different lord, the maſter of the family, and the proprietor of all the flocks and herds belonging to it. Such was the ſtate of the firſt ſocieties which the narrative of Moſes exhibits to our attention.

6 Theories of philoſophers concerning the origin of ſociety

Thoſe philoſophers who have made ſociety, in its various ſtages between rudeneſs and refinement, the ſubject of their ſpeculations, have generally conſidered mankind, in whatever region of the globe, and under whatever climate, as proceeding uniformly through certain regular gradations from one extreme to the other. They regard them, firſt, as gaining a precarious ſubſiſtence by gathering the ſpontaneous fruits of the earth, preying on the inhabitants of the waters, if placed on the ſea-ſhore, or along the banks of large rivers; or hunting wild beaſts, if in a ſituation where theſe are to be found in abundance; without foreſight or induſtry to provide for future wants when the preſent call of appetite is gratified. Next, they ſay, man riſes to the ſhepherd ſtate, and next to that of huſbandmen, when they turn their attention from the management of flocks to the cultivation of the ground. Next, theſe huſbandmen improve their powers, and better their condition, by becoming artizans and merchants; and the beginning of this period is the boundary between barbarity and civilization.

Theſe are the ſtages through which they who have employed themſelves on the natural hiſtory of ſociety have generally conducted mankind in their progreſs from rudeneſs to refinement: but they ſeem to have overlooked the manner in which mankind were at firſt eſtabliſhed on this earth; for the circumſtances in which the parents of the human race were originally placed; for the degree of knowledge communicated to them; and for the inſtruction which they muſt have been capable of communicating to their poſterity. They rather appear to conſider the inhabitants of every different region of the globe as aborigines, ſpringing at firſt from the ground, or dropped on the ſpot which they inhabit; no leſs ignorant than infants of the nature and relations of the objects around them, and of the purpoſes which they may accompliſh by the exerciſe of their organs and faculties.

7 are fanciful.

The abſurdity of this theory has been fully demonſtrated in another place: and if we agree to receive the Moſaic account of the original eſtabliſhment of mankind, we ſhall be led to view the phenomena of ſocial life in a light very different. We muſt firſt allow, that though many of the rudeſt tribes are found in the ſtate of *hunters* or *fiſhers*; yet the hunting or fiſhing ſtate cannot have been invariably the primary form of ſociety. Notwithſtanding the powers with which we are endowed, we are in a great meaſure the creatures of circumſtances. Phyſical cauſes exert, though indirectly, a mighty influence in forming the character and directing the exertions of the human race. From the information of Moſes we gather, that the firſt ſocieties of men lived under the patriarchal form of government, and employed themſelves in the cultivation of the ground and the management of flocks. And as we know that mankind, being ſubjected to the influence both of phyſical and moral cauſes, are no leſs liable to degeneracy than capable of improvement; we may eaſily conceive, that though deſcending all from the ſame original pair, and though enlightened with much traditionary knowledge relative to the arts of life, the order of ſociety, moral diſtinctions, and religious obligations; yet as they were gradually, and by various accidents, diſperſed over the earth, being removed to ſituations in which the arts with which they were acquainted could but little avail them, where induſtry was overpowered, or indolence encouraged by the ſeverity or the profuſion of nature, they might degenerate and fall into a condition almoſt as humble and precarious as that of the brutal tribes. Other moral cauſes might alſo concur to debaſe or elevate the human character in that early period. The particular character of the original ſettlers in any region, the manner in which they were connected with one another, and the arts which they were beſt qualified to exerciſe, with various other cauſes of a ſimilar nature, would have conſiderable influence in determining the character of the ſociety.

When laying aſide the ſpirit of theory and ſyſtem, we ſet ourſelves, with due humility, to trace facts, and to liſten to evidence, though our diſcoveries may be fewer than we ſhould otherwiſe fancy them; yet the knowledge which we thus acquire will be more uſeful and ſolid, and our ſpeculations more conſiſtent with the ſpirit of true philoſophy. Here, though we learn from the information of the ſacred writings, that the firſt family of mankind was not cruelly expoſed in this world, as children whom the inhumanity of their parents induces them to deſert; yet we are not, in conſequence of admitting this fact, laid under any neceſſity of denying or explaining away any of the other phenomena which occur to our obſervation when tracing the natural hiſtory of ſociety. Tradition may be corrupted; arts and ſciences may be loſt; the ſublimeſt religious doctrines may be debaſed into abſurdity.

If then we are deſirous of ſurveying ſociety in its rudeſt

Society. deſt form, we muſt look, not to the earlieſt period of its exiſtence, but to thoſe diſtricts of the globe where external circumſtances concur to drive them into a ſtate of ſtupidity and wretchedneſs. Thus in many places of the happy clime of Aſia, which a variety of ancient records concur with the ſacred writings in repreſenting as the firſt peopled quarter of the globe, we cannot trace the form of ſociety backwards beyond the ſhepherd ſtate. In that ſtate indeed the bonds which connect ſociety extend not to a wide range of individuals, and men remain for a long period in diſtinct families; but yet that ſtate is highly favourable to knowledge, to happineſs, and to

8

Yet in ſome particular inſtances realized.

virtue. Again, the torrid and the frozen regions of the earth, though probably peopled at a later period, and by tribes ſprung from the ſame ſtock with the ſhepherds of Aſia, have yet exhibited mankind in a much lower ſtate. It is in the parched deſerts of Africa and the wilds of America that human beings have been found in a condition approaching the neareſt to that of the brutes.

We may therefore with ſome propriety deſert the order of time, and take a view of the different ſtages through which philoſophers have conſidered mankind as advancing, beginning with that of rudeneſs, though we have ſhown that it cannot have been the firſt in the progreſs.

9

Rudeſt ſtate or firſt ſtage of ſociety.

Where the human ſpecies are found in the loweſt and rudeſt ſtate, their rational and moral powers are very faintly diſplayed; but their external ſenſes are acute, and their bodily organs active and vigorous. Hunting and fiſhing are then their chief employments on which they depend for ſupport. During that portion of their time which is not ſpent in theſe purſuits, they are ſunk in liſtleſs indolence. Deſtitute of foreſight, they are rouſed to active exertion only by the preſſure of immediate neceſſity or the urgent calls of appetite. Accuſtomed to endure the ſeverity of the elements, and but ſcantily provided with the means of ſubſiſtence, they acquire habits of reſignation and fortitude, which are beheld with aſtoniſhment by thoſe who enjoy the plenty and indulgence of cultivated life. But in this ſtate of want and depreſſion, when the powers and poſſeſſions of every individual are ſcarcely ſufficient for his own ſupport, when even the calls of appetite are repreſſed becauſe they cannot always be gratified, and the more refined paſſions, which either originate from ſuch as are merely animal, or are intimately connected with them, have not yet been felt—in this ſtate all the milder affections are unknown; or if the breaſt is at all ſenſible to their impulſe, it is extremely feeble. Huſband and wife, parent and child, brother and brother, are united by the weakeſt ties. Want and misfortune are not pitied. Why indeed ſhould they, where they cannot be relieved? It is impoſſible to determine how far beings in this condition can be capable of moral diſtinctions. One thing certain is, that in no ſtate are the human race entirely incapable of theſe. If we liſten, however, to the relations of reſpectable travellers, we muſt admit that human beings have ſometimes been found in that abject ſtate where no proper ideas of ſubordination, government, or diſtinction of ranks, could be formed. No diſtinct notions of Deity can be here entertained. Beings in ſo humble a condition cannot look through the order of the univerſe and the harmony of nature to that Eternal Wiſdom and Goodneſs which contrived, and that Almighty Power which brought into exiſtence, the ſyſtem of things. Of arts they muſt be almoſt totally deſtitute. They may uſe ſome inſtruments for fiſhing or the chace; but theſe muſt be extremely rude and ſimple. If they be acquainted with any means to ſhelter them from the inclemency of the elements, both their houſes and clothing will be aukward and inconvenient. Society.

10

Social ſtate in the ſecond ſtage of ſociety.

But human beings have not been often found in ſo rude a ſtate as this. Even thoſe tribes which we denominate ſavage, are for the moſt part farther removed from mere animal life. They generally appear united under ſome ſpecies of government, exerciſing the powers of reaſon, capable of morality, though that morality be not always very refined; diſplaying ſome degree of ſocial virtues, and acting under the influence of religious ſentiments. Thoſe who may be conſidered as but one degree higher in the ſcale than the ſtupid and wretched beings whoſe condition we have ſurveyed, are to be found ſtill in the hunting and fiſhing ſtate; but they are farther advanced towards ſocial life, and are become more ſenſible to the impulſe of ſocial affection. By unavoidable intercourſe in their employments, a few individual hunters or fiſhers contract a certain degree of fondneſs for each other's company, and are led to take ſome part in each other's joys and ſorrows; and when the ſocial affections thus generated (ſee PASSION) begin to exert themſelves, all the other powers of the mind are at the ſame time called forth, and the circumſtances of the little ſociety are immediately improved. We behold its members in a more comfortable condition, and find reaſon to view the human character with more complacency and reſpect. Huts are now built, more commodious clothes are faſhioned, inſtruments for the annoyance of wild beaſts and even of enemies are contrived, in ſhort, arts, and ſcience, and ſocial order, and religious ſentiment, and ceremonies, now make their appearance in the riſing ſociety, and ſerve to characterize it by the particular form which diſtinguiſhes each of them. But though ſocial order is no longer unknown nor unobſerved, yet the form of government is ſtill extremely ſimple, and its ties are but looſe and feeble. It will perhaps bear ſome reſemblance to the patriarchal; only all its members are on a more equal footing, and and at the ſame time leſs cloſely connected than in the ſhepherd ſtate, to which that form of government ſeems almoſt peculiar. The old men are treated with veneration; but the young are not entirely ſubject to them. They may liſten reſpectfully to their advice; but they do not ſubmit to their arbitrary commands. Where mankind are in the ſtate of hunters and fiſhers, where the means of ſubſiſtence are precariouſly acquired, and prudent foreſight does not prompt to accumulate much proviſion for the future, no individual can acquire comparative wealth. As ſoon as the ſon is grown up, he ceaſes to be dependent on his father, as well as on the ſociety in general. Difference of experience therefore conſtitutes the only diſtinction between the young and the old; and if the old have experience, the young have ſtrength and activity. Here, then, neither age nor property can give riſe to any ſtriking diſtinction of ranks. All who have attained to manhood, and are not diſabled by unuſual deficiency of ſtrength or agility, or by the infirmities of old age, are on an equal footing; or if any one poſſeſs a pre-eminence over the reſt, he owes it to

ſuperior

Society.

fuperior addrefs or fortitude. The whole tribe deliberate; the old give their advice; each individual of the affembly receives or rejects it at his pleafure (for the whole body think not of exercifing any compulfatory power over the will of individuals); and the warrior who is moft diftinguifhed for ftrength, addrefs, and valour, leads out the youth of the tribe to the chace or againft the enemy. War, which in the former ftage did not prevail, as they who were ftrangers to focial fentiments were, at the fame time, fcarce capable of being enemies, now firft begins to depopulate the thinly inhabited regions where thofe hunters and fifhers purfue their prey. They are fcattered, poffibly in fcanty and feparate tribes, over an immenfe tract of country; but they know no medium between the affection which brethren of the fame tribe bear to each other and the hatred of enemies. Though thinly fcattered over the earth, yet the hunting parties of different tribes will fometimes meet as they range the forefts; and when they meet, they will naturally view each other with a jealous eye; for the fuccefs of the one party in the chace may caufe the other to be unfuccefsful; and while the one fnatches the prey, the other muft return home to all the pangs of famine. Inveterate hoftility will therefore long prevail among neighbouring tribes in the hunting ftate.

If we find them not incapable of focial order, we may naturally expect that their conduct will be influenced by fome fentiments of religion. They have at this period ideas of fuperior beings. They alfo practife certain ceremonies to recommend them to thofe beings; but both their fentiments and ceremonies are fuperftitious and abfurd.

We have elfewhere fhown (fee POLYTHEISM) how favage tribes have probably degenerated from the pure worfhip of the one true God to the adoration of a multitude of imaginary divinities in heaven, earth, and hell. We have traced this idolatrous worfhip from that of the heavenly bodies, through all the gradations of dæmon-worfhip, hero-worfhip, and ftatue-worfhip, to that wonderful inftance of abfurd fuperftition which induced the inhabitants of fome countries to fall proftrate in adoration before the vileft reptiles. But though we are convinced that the heavenly bodies have by all idolaters been confidered as their firft and greateft gods, we pretend not that the progrefs through the other ftages of polytheifm has been everywhere in the very fame order. It is indeed impoffible to exhibit under one general view an account of arts, manners, and religious fentiments, which may apply to fome certain period in the hiftory of every nation. The characters and circumftances of nations are fcarce lefs various and anomalous than thofe of individuals. Among many of the American tribes, among the ancient inhabitants of the forefts of Germany, whofe manners have been fo accurately delineated by the mafterly pen of Tacitus, and in fome of the iflands fcattered over the fouthern ocean, religion, arts, and government, have been found in that ftate which we have defcribed as characterifing the fecond ftage of focial life. But neither can we pretend that all thofe fimple and rude focieties have been defcribed by hiftorians and travellers as agreeing precifely in their arts, manners, and religious fentiments; or that the difference of circumftances always enables us to account in a fatisfactory manner for the diftinction of their characters. There is a variety of facts in the hiftory of the early periods of fociety, which no ingenuity, no induftry however painful, can reduce under general heads. Here, as well as when we attempt to philofophize on the phenomena of the material world, we find reafon to confefs that our powers are weak, and our obfervation confined within a narrow fphere.

II
Third ftage in the progrefs of fociety, in which ideas of property and inequality of ranks appear.

But we may now carry our views a little forward, and furvey human life as approaching fomewhat nearer to a civilized and enlightened ftate. As property is acquired, inequality and fubordination of ranks neceffarily follow: and when men are no longer equal, the many are foon fubjected to the will of the few. But what gives rife to thefe new phenomena is, that after having often fuffered from the precarioufnefs of the hunting and fifhing ftate, men begin to extend their cares beyond the prefent moment, and to think of providing fome fupply for future wants. When they are enabled to provide fuch a fupply, either by purfuing the chace with new eagernefs and perfeverance, by gathering the fpontaneous fruits of the earth, or by breeding tame animals—thefe acquifitions are at firft the property of the whole fociety, and diftributed from a common ftore to each individual according to his wants: But as various reafons will foon concur to convince the community, that by this mode of diftribution, induftry and activity are treated with injuftice, while negligence and indolence receive more than their due, each individual will in a fhort time become his own fteward, and a community of goods will be abolifhed. As foon as diftinct ideas of property are formed, it muft be unequally diftributed; and as foon as property is unequally diftributed, there arifes an inequality of ranks. Here we have the origin of the depreffion of the female fex in rude ages, of the tyrannical authority exercifed by parents over their children, and perhaps of flavery. The women cannot difplay the fame perfeverance, or activity, or addrefs, as the men, in purfuing the chace. They are therefore left at home; and from that moment are no longer equals, but flaves and dependants, who muft fubfift by the bounty of the males, and muft therefore fubmit with implicit obedience to all their capricious commands. Even before the era of property, the female fex were viewed as inferiors; but till that period they were not reduced to a ftate of abject flavery.

In this period of fociety new notions are formed of the relative duties. Men now become citizens, mafters, and fervants; hufbands, parents, &c. It is impoffible to enumerate all the various modes of government which take place among the tribes who have advanced to this ftage; but one thing certain is, that the authority of the few over the many is now firft eftablifhed, and that the rife of property firft introduces inequality of ranks. In one place, we fhall perhaps find the community fubjected during this period to the will of a fingle perfon; in another, power may be lodged in the hands of a number of chiefs; and in a third, every individual may have a voice in creating public officers, and in enacting laws for the fupport of public order. But as no code of laws is formed during this period, juftice is not very impartially adminiftered, nor are the rights of individuals very faithfully guarded. Many actions, which will afterwards be confidered as heinoufly immoral, are now confidered as praife-worthy or indifferent. This is the age of hero-worfhip, and of houfehold and tutelary gods; for

Society.

for it is in this stage of society that the invention of arts, which gave rise to that worship, contributes most conspicuously to the public good. War, too, which we considered as beginning first to ravage the earth during the former period, and which is another cause of the deification of dead men, will still prevail in this age, and be carried on with no less ferocity than before, though in a more systematic form.

The prevalence of war, and the means by which subsistence is procured, cannot but have considerable influence on the character and sentiments of societies and individuals. The hunter and the warrior are characters in many respects different from the shepherd and the husbandman. Such, in point of government, arts, and manners, religious and moral sentiments, were several of the German tribes described by Tacitus; and the Britons whose character has been sketched by the pen of Cæsar: such, too, were the Romans in the early period of their history; such too the inhabitants of Asia Minor about the time of the siege of Troy, as well as the Greeks whom Homer celebrates as the destroyers of the Trojan state: the northern tribes also, who poured through Asia, Africa, and Europe, and overthrew the Roman empire, appear to have been of a nearly similar character. It seems to be a general opinion among those who have directed their attention to the history of society, that, in the scale ascending from the lowest condition of human beings to the most civilized and enlightened state of society, the shepherd state is the next in order above the hunting; and that as mankind improve in knowledge and in moral sentiments, and as the forests are gradually depopulated of their inhabitants, instead of destroying the inferior animals, men become their guardians and protectors. But we cannot unreservedly subscribe to this opinion: we believe, that in the shepherd state societies have been sometimes found superior to the most polished tribes of hunters; but upon viewing the annals of mankind in early ages, we observe that there is often no inconsiderable resemblance even between hunters and shepherds in point of the improvement of the rational faculties and the moral sense; and we are therefore led to think, that these two states are sometimes parallel: for instance, several of the American tribes, who still procure their subsistence by hunting, appear to be nearly in the state which we have described as the third stage in the progress of society; and the ancient shepherds of Asia do not appear to have been much more cultivated and refined. We even believe that men have sometimes turned their attention from hunting to agriculture, without passing through any intermediate state. Let us remember, that much depends upon local circumstances, and somewhat undoubtedly on original inspiration and traditionary instruction. In this period of society the state of the arts well deserves our attention. We shall find, that the shepherds and the hunters are in that respect on a pretty equal footing. Whether we examine the records of ancient history, or view the islands scattered through the South sea, or range the wilds of America, or survey the snowy wastes of Lapland and the frozen coast of Greenland—still we find the useful arts in this period, though known and cultivated, in a very rude state; and the fine arts, or such as are cultivated merely to please the fancy or to gratify caprice, displaying an odd and fantastic, not a true or natural, taste; yet this is the period in which eloquence shines with the truest lustre: all is metaphor or glowing sentiment. Languages are not yet copious; and therefore speech is figurative, expressive, and forcible. The tones and gestures of nature, not being yet laid aside, as they generally are, from regard to decorum, in more polished ages, give a degree of force and expression to the harangues of the rustic or savage orator, which the most laborious study of the rules of rhetoric and elocution could not enable even a more polished orator to display.

12

Fourth stage; in which agriculture flourishes, the arts are subdivided, commerce and regular government are introduced.

But let us advance a little farther, and contemplate our species in a new light, where they will appear with greater dignity and amiableness of character. Let us view them as husbandmen, artizans, and legislators. Whatever circumstances might turn the attention of any people from hunting to agriculture, or cause the herdsman to yoke his oxen for the cultivation of the ground, certain it is that this change in the occupation would produce a happy change on the character and circumstances of men; it would oblige them to exert a more regular and persevering industry. The hunter is like one of those birds that are described as passing the winter in a torpid state. The shepherd's life is extremely indolent. Neither of these is very favourable to refinement. But different is the condition of the husbandman. His labours succeed each other in regular rotation through the year. Each season with him has its proper employments: he therefore must exert active persevering industry; and in this state we often find the virtues of rude and polished ages united. This is the period where barbarism ends and civilization begins. Nations have existed for ages in the hunting or the shepherd state, fixed as by a kind of stagnation, without advancing farther. But scarcely any instances occur in the history of mankind of those who once reached the state of husbandmen, remaining long in that condition without rising to a more civilized and polished state. Where a people turn their attention in any considerable degree to the objects of agriculture, a distinction of occupations naturally arises among them. The husbandman is so closely employed through the several seasons of the year in the labours of the field, that he has no longer leisure to exercise all the rude arts known among his countrymen. He has not time to fashion the instruments of husbandry, to prepare his clothes, to build his house, to manufacture household utensils, or to tend those tame animals which he continues to rear. Those different departments therefore now begin to employ different persons; each of whom dedicates his whole time and attention to his own occupation. The manufacture of cloth is for a considerable time managed exclusively by the women; but smiths and joiners arise from among the men. Metals begin now to be considered as valuable materials. The intercourse of mankind is now placed on a new footing. Before, every individual practised all the arts that were known, as far as was necessary for supplying himself with the conveniences of life. Now he confines himself to one or to a few of them; and, in order to obtain a necessary supply of the productions of those arts which he does not cultivate himself, he gives in exchange a part of the productions of his own labours. Here we have the origin of commerce.

After continuing perhaps for some time in this state, as arts and distinctions multiply in society, the exchange

change of one commodity for another is found troubleſome and inconvenient. It is ingeniouſly contrived to adopt a medium of commerce, which being eſtimated not by its intrinſic value, but by a certain nominal value which it receives from the agreement of the ſociety among whom it is uſed, ſerves to render the exchange of property, which is ſo neceſſary for the purpoſes of ſocial life, eaſy and expeditious. Wherever metals have been known, they appear to have been adopted as the medium of commerce almoſt as ſoon as ſuch a medium began to be uſed: and this is one important purpoſe for which they ſerve; but they have ſtill more important uſes. Almoſt all the neceſſary arts depend on them. Where the metals are known, agriculture practiſed, and the neceſſary arts diſtributed among different orders of artiſans—civilization and refinement, if not obſtructed by ſome accidental circumſtances, advance with a rapid progreſs. With regard to the firſt applying of the precious metals as the medium of commerce, we may obſerve, that this was probably not accompliſhed by means of a formal contract. They might be firſt uſed as ornaments; and the love of ornament, which prevails among rude as much as among civilized nations, would render every one willing to receive them in exchange for ſuch articles as he could ſpare. Such might be the change produced on ſociety with regard to the neceſſary arts by the origin of agriculture. As ſoon as ornament and amuſement are thought of, the fine arts begin to be cultivated. In their origin therefore they are not long poſterior to the neceſſary and uſeful arts. They appear long before men reach the comfortable and reſpectable condition of huſbandmen; but ſo rude is their character at their firſt origin, that our *Dilettanti* would probably view the productions of that period with unſpeakable contempt and diſguſt. But in the period of ſociety which we now conſider, they have aſpired to a higher character; yet poetry is now perhaps leſs generally cultivated than during the ſhepherd ſtate. Agriculture, conſidered by itſelf, is not directly favourable either to refinement of manners or to the fine arts. The converſation of ſhepherds is generally ſuppoſed to be far more elegant than than of huſbandmen; but though the direct and immediate effects of this condition of life be not favourable to the fine arts, yet indirectly it has a ſtrong tendency to promote their improvement. Its immediate influence is extremely favourable to the neceſſary and uſeful arts; and theſe are no leſs favourable to the fine arts.

One of the nobleſt changes which the introduction of the arts by agriculture produces on the form and circumſtances of ſociety, is the introduction of regular government and laws. In tracing the hiſtory of ancient nations, we ſcarcely ever find laws introduced at an earlier period. Minos, Solon, and Lycurgus, do not appear to have formed codes of wiſdom and juſtice for regulating the manners of their countrymen, till after the Cretans, the Athenians, and even the Lacedemonians, had made ſome progreſs in agriculture and the uſeful arts.

Religion, under all its various forms, has in every ſtage of ſociety a mighty influence on the ſentiments and conduct of men (ſee RELIGION); and the arts cultivated in ſociety have on the other hand ſome influence on the ſyſtem of religious belief. One happy effect which will reſult from the invention of arts, though perhaps not immediately, will be, to render the character of the deities more benevolent and amiable, and the rites of their worſhip more mild and humane.

The female ſex in this period generally find the yoke of their ſlavery ſomewhat lightened. Men now become eaſier in their circumſtances; the ſocial affections aſſume ſtronger influence over the mind; plenty, and ſecurity, and eaſe, at once communicate both delicacy and keenneſs to the ſenſual deſires. All theſe circumſtances concur to make men relax in ſome degree that tyrannic ſway by which they before depreſſed the ſofter ſex. The foundation of that empire, where beauty triumphs over both wiſdom and ſtrength, now begins to be laid. Such are the effects which hiſtory warrants as to attribute to agriculture and the arts; and ſuch the outlines of the character of that which we reckon the fourth ſtage in the progreſs of ſociety from rudeneſs to refinement.

13
Fifth ſtage in the progreſs of ſociety; in which literature, arts, and ſciences, are much cultivated, and religion aſſumes a mild and engaging aſpect.

Let us advance one ſtep farther. We have not yet ſurveyed mankind in their moſt poliſhed and cultivated ſtate. Society is rude at the period when the arts firſt begin to ſhow themſelves, in compariſon of that ſtate to which it is raiſed by the induſtrious cultivation of them. The neighbouring commonwealths of Athens and Lacedemon afford us a happy opportunity of comparing this with the former ſtage in the progreſs of ſociety. The chief effect produced by the inſtitutions of Lycurgus ſeems to have been, to fix the manners of his countrymen for a conſiderable period in that ſtate to which they had attained in his days. Spartan virtue has been admired and extolled in the language of enthuſiaſm; but in the ſame manner has the character and the condition of the ſavage inhabitants of the wilds of America, been preferred by ſome philoſophers, to the virtues and the enjoyments of ſocial life in the moſt poliſhed and enlightened ſtate. The Spartans in the days of Lycurgus had begun to cultivate the ground, and were not unacquainted with the uſeful arts. They muſt ſoon have advanced farther had not Lycurgus ariſen, and by effecting the eſtabliſhment of a code of laws, the tendency of which appears to have been in many particulars directly oppoſite to the deſigns of nature, retarded their progreſs towards complete civilization and refinement. The hiſtory of the Lacedemonians, therefore, while the laws of Lycurgus continued in force, exhibits the manners and character of a people in that which we have denominated the fourth ſtage in the progreſs of ſociety. But if we turn our eyes to their neighbours the Athenians, we behold in their hiſtory the natural progreſs of opinions, arts, and manners. The uſeful arts are firſt cultivated with ſuch ſteady induſtry, as to raiſe the community to opulence, and to furniſh them with articles for commerce with foreign nations. The uſeful arts cannot be raiſed to this height of improvement without leading men to the purſuit of ſcience. Commerce with foreign nations, ſkill in the uſeful arts, and a taſte for ſcience, mutually aid each other, and conſpire to promote the improvement of the fine arts. Hence magnificent buildings, noble ſtatues, paintings expreſſive of life, action, and paſſion; and poems in which imagination adds new grace and ſublimity to nature, and gives the appearances of ſocial life more irreſiſtible power over the affections of the heart. Hence are moral diſtinctions more carefully ſtudied, and the

Society. the rights of every individual and every order in society better understood and more accurately defined. Moral science is generally the first scientific pursuit which strongly attracts the attention of men. Lawgivers appear before geometricians and astronomers. Some particular circumstances may cause these sciences to be cultivated at a very early period. In Egypt the overflowing of the Nile caused geometry to be early cultivated. Causes no less favourable to the study of astronomy, concurred to recommend that science to the attention of the Chaldeans long before they had attained the height of refinement. But, in general, we find, that the laws of morality are understood, and the principles of morals inquired into, before men make any considerable progress in physical science, or even prosecute it with any degree of keenness. Accordingly, when we view the state of literature in this period (for it is now become an object of so much importance as to force itself on our attention), we perceive that poetry, history, and morals, are the branches chiefly cultivated. Arts are generally casual inventions, and long practised before rules and principles on which they are founded assume the form of science. But morality, if considered as an art, is that art which men have soonest and most constantly occasion to practise. Besides, we are so constituted by the wisdom of nature, that human actions, and the events which befal human beings, have more powerful influence than any other object to engage and fix our attention. Hence we are enabled to explain why morality, and these branches of literature more immediately connected with it, are almost always cultivated in preference to physical science. Though poetry, history, and morals, be pursued with no small eagerness and success in that period of society which we now consider, we need not therefore be greatly surprised that natural philosophy is neither very generally nor very successfully cultivated. Were we to consider each particular in that happy change which is now produced on the circumstances of mankind, we should be led into a too minute and perhaps unimportant detail. This is the period when human virtue and human abilities shine with most splendour. Rudeness, ferocity, and barbarism, are now banished. Luxury has made her appearance; but as yet she is the friend and the benefactress of society. Commerce has stimulated and rewarded industry, but has not yet contracted the heart and debased the character. Wealth is not yet become the sole object of pursuit. The charms of social intercourse are known and relished; but domestic duties are not yet deserted for public amusements. The female sex acquire new influence, and contribute much to refine and polish the manners of their lords. Religion now assumes a milder and more pleasing form; splendid rites, magnificent temples, pompous sacrifices, and gay festivals, give even superstition an influence favourable to the happiness of mankind. The gloomy notions and barbarous rites of former periods fall into disuse. The system of theology produced in former ages still remains: but only the mild and amiable qualities of the deities are celebrated; and none but the gay, humane, and laughing divinities, are worshipped. Philosophy also teaches men to discard such parts of their religion as are unfriendly to good morals, and have any tendency to call forth or cherish unsocial sentiments in the heart. War (for in this period of society enough of causes will arise to arm one nation against another)—war, however, no longer retains its former ferocity; nations no longer strive to extirpate one another: to procure redress for real or imaginary injuries; to humble, not to destroy, is now its object. Prisoners are no longer murdered in cold blood, subjected to horrid and excruciating tortures, or condemned to hopeless slavery. They are ransomed or exchanged; they return to their country, and again fight under its banners. In this period the arts of government are likewise better understood, and practised so as to contribute most to the interests of society. Whether monarchy, or democracy, or aristocracy, be the established form, the rights of individuals and of society are in general respected. The interests of society are so well understood, that the few, in order to preserve their influence over the many, find it necessary to act rather as the faithful servants than the imperious lords of the public. Though the liberties of a nation in this state be not accurately defined by law, nor their property guaranteed to them by any legal institutions, yet their governors dare not violate their liberties, nor deprive them wantonly of their properties. This is truly the golden age of society: every trace of barbarism is entirely effaced; and vicious luxury has not yet begun to sap the virtue and the happiness of the community. Men live not in listless indolence; but the industry in which they are engaged is not of such a nature as to overpower their strength or exhaust their spirits. The social affections have now the strongest influence on men's sentiments and conduct.

14
Degeneracy and decline of society.

But human affairs are scarcely ever stationary. The circumstances of mankind are almost always changing, either growing better or worse. Their manners are ever in the same fluctuating state. They either advance towards perfection or degenerate. Scarcely have they attained that happy period in which we have just contemplated them, when they begin to decline till they perhaps fall back into a state nearly as low as that from which we suppose them to have emerged. Instances of this unhappy degeneracy occur more than once in the history of mankind; and we may finish this short sketch of the history of society by mentioning in what manner this degeneracy takes place. Perhaps, strictly speaking, every thing but the simple necessaries of life may be denominated luxury: For a long time, however, the welfare of society is best promoted, while its members aspire after something more than the mere necessaries of life. As long as these superfluities are to be obtained only by active and honest exertion; as long as they only engage the leisure hours, without becoming the chief objects of pursuit—the employment which they give to the faculties is favourable both to the virtue and the happiness of the human race.

The period arrives, however, when luxury is no longer serviceable to the interests of nations; when she is no longer a graceful, elegant, active form, but a languid, overgrown, and bloated carcase. It is the love of luxury, which contributed so much to the civilization of society, that now brings on its decline. Arts are cultivated and improved, and commerce extended, till enormous opulence be acquired: the effect of opulence is to awaken the fancy, to conceive ideas of new and capricious wants, and to inflame the breast with new desires. Here we have the origin of that selfishness which, operating in conjunction with caprice and the violence of unbridled

Society. unbridled paſſions, contributes ſo much to the corruption of virtuous manners. Selfiſhneſs, caprice, indolence, effeminacy, all join to looſen the bonds of ſociety, to bring on the degeneracy both of the uſeful and the fine arts, to baniſh at once the mild and the auſtere virtues, to deſtroy civil order and ſubordination, and to introduce in their room anarchy or deſpotiſm.

Scarcely could we have found an example of the beautiful form of ſociety which we laſt attempted to deſcribe. Never, at leaſt, has any nation continued long to enjoy ſuch happy circumſtances, or to diſplay ſo amiable and reſpectable a character. But when we ſpeak of the declining ſtate of ſociety, we have no difficulty in finding inſtances to which we may refer. Hiſtory tells of the Aſſyrians, the Egyptians, and the Perſians, all of them once flouriſhing nations, but brought low by luxury and an unhappy corruption of manners. The Greeks, the Romans, and the Aſſyrians, owed their fall to the ſame cauſes; and we know not if a ſimilar fate does not now threaten many of thoſe nations who have long made a diſtinguiſhed figure in the ſyſtem of Europe. The Portugueſe, the Venetians, and the Spaniards, have already fallen; and what is the preſent ſtate of our neighbours the French? They have long been a people deſtitute of religion, corrupted in morals, unſteady in conduct, and ſlaves to pleaſure and public amuſements. Among them luxury had arrived at its higheſt pitch; and the conſequence has been, that after capriciouſly ſhaking off the yoke of deſpotiſm, they have eſtabliſhed, or rather ſet up (for eſtabliſhed it cannot be), a motley kind of government, which, in the courſe of a few years, has exhibited ſcenes of tyranny and oppreſſion, to which we doubt if the annals of the world can furniſh any parallel. Yet this is the people whoſe manners the other nations of Europe were ambitious to imitate. May thoſe nations take warning in time, and avoid the rocks upon which they have ſplit.

15 Concluding remarks.

Thus have we viewed the ſeveral ſtages in which ſociety appears in its progreſs from rudeneſs to refinement and decay. The intelligent reader will perceive, that the various and anomalous phenomena which occur in the natural hiſtory of ſociety, cannot eaſily be ſolved; becauſe the neceſſary information cannot be obtained. Others have been well accounted for by the reſearches of curious philoſophical inquirers. Local circumſtances, the influence of climate, the intercourſe of nations in different ſtates of civilization, have been taken notice of, as cauſes ſerving to accelerate or retard the progreſs of arts and manners. But our proper buſineſs here was merely to mark the gradations between barbariſm and refinement: and as the painter who is to exhibit a ſeries of portraits repreſenting the human form in infancy, puerility, youth, and manhood, will not think of delineating all that variety of figures and faces which each of thoſe periods of life affords, and will find himſelf unable to repreſent in any ſingle figure all diverſities of form and features; ſo we have not once thought of deſcribing particularly under this article, all the various national characters reducible to any one of thoſe diviſions under which we have viewed the progreſs of ſociety, nor have found it poſſible to comprehend under one conſiſtent view, all the particulars which may be gathered from the remains of antiquity, from the relations of later travellers, and the general records of hiſtory concerning the progreſſive character of mankind in various regions, and under the influence of various accidents and circumſtances. This indeed would even have been improper, as all that information appears under other articles in this Work.

Societies. SOCIETIES, aſſociations voluntarily formed by a number of individuals for promoting knowledge, induſtry, or virtue. They may therefore be divided into three claſſes; ſocieties for promoting ſcience and literature, ſocieties for encouraging and promoting arts and manufactures, and ſocieties for diffuſing religion and morality and relieving diſtreſs. Societies belonging to the firſt claſs extend their attention to all the ſciences and literature in general, or devote it to one particular ſcience. The ſame obſervation may be applied to thoſe which are inſtituted for improving arts and manufactures. Thoſe of the third claſs are eſtabliſhed, either with a view to prevent crimes, as the Philanthropic Society; for the diffuſion of the Chriſtian religion among unenlightened nations, as the Society for the Propagation of the Goſpel in Foreign Parts; or for introducing arts and civilization, along with a knowledge of the Chriſtian religion, as the Sierra Leona company.

The honour of planning and inſtituting ſocieties for thoſe valuable purpoſes is due to modern times. A literary aſſociation is ſaid to have been formed in the reign of Charlemagne (ſee ACADEMY); but the plan ſeems to have been rude and defective. Several others were inſtituted in Italy in the 16th century; but from the accounts which we have ſeen of them, they ſeem to have been far inferior to thoſe which are moſt flouriſhing at preſent. The moſt enlarged idea of literary ſocieties ſeems to have originated with the great Lord Bacon, the father of modern philoſophy, who recommended to the reigning prince to inſtitute ſocieties of learned men, who ſhould give to the world from time to time a regular account of their reſearches and diſcoveries. It was the idea of this great philoſopher, that the learned world ſhould be united, as it were, into one immenſe republic; which, though conſiſting of many detached ſtates, ſhould hold a ſtrict union and preſerve a mutual intelligence with each other, in every thing that regards the common intereſt. The want of this union and intelligence he laments as one of the chief obſtacles to the advancement of ſcience; and, juſtly conſidering the inſtitution of public ſocieties, in the different countries of Europe, under the auſpices of the ſovereign, to be the beſt remedy for that defect, he has given, in his fanciful work, the New Atlantis, the delineation of a philoſophical ſociety on the moſt extended plan, for the improvement of all arts and ſciences; a work which, though written in the language, and tinctured with the colouring of romance, is full of the nobleſt philoſophic views. The plan of Lord Bacon, which met with little attention from the age in which he lived, was deſtined to produce its effect in a period not very diſtant. The ſcheme of a philoſophical college by Cowley is acknowledged to have had a powerful influence in procuring the eſtabliſhment of the Royal Society of London by charter from Charles II. §; and Cowley's plan is manifeſtly copied in almoſt all its parts from that in the New Atlantis. The inſtitution of the Royal Society of London was ſoon followed by the eſtabliſhment of the Royal Academy

§ *Sprat's Hiſtory of the Royal Society*, 2d edit. p. 39.

Religious and Humane Societies.

demy of Sciences at Paris; and theſe two have ſerved as models to the philoſophical academies of higheſt reputation in the other kingdoms of Europe.

The experience of ages has ſhown, that improvements of a public nature are beſt carried on by ſocieties of liberal and ingenious men, uniting their labours without regard to nation, ſect, or party, in one grand purſuit alike intereſting to all, whereby mutual prejudices are worn off, and a humane philoſophical ſpirit is cheriſhed. Men united together, and frequently meeting for the purpoſe of advancing the ſciences, the arts, agriculture, manufactures, and commerce, may oftentimes ſuggeſt ſuch hints to one another as may be improved to important ends; and ſuch ſocieties, by being the repoſitories of the obſervations and diſcoveries of the learned and ingenious, may from time to time furniſh the world with uſeful publications which might otherwiſe be loſt: for men of ingenuity and modeſty may not chooſe to riſk their reputation, by ſending abroad unpatronized what a learned ſociety might judge richly worth the public eye; or perhaps their circumſtances being ſtraitened, they may not be able to defray the expence of publication. Societies inſtituted for promoting knowledge may alſo be of eminent ſervice, by exciting a ſpirit of emulation, and by enkindling thoſe ſparks of genius which otherwiſe might for ever have been concealed; and if, when poſſeſſed of funds ſufficient for the purpoſe, they reward the exertions of the induſtrious and enterpriſing with pecuniary premiums or honorary medals, many important experiments and uſeful diſcoveries will be made, from which the public may reap the higheſt advantages.

Eminent inſtances of the beneficial effects of ſuch inſtitutions we have in the Royal Academy of Sciences at Paris, the Royal Society, and the Society inſtituted for the Encouragement of Arts, Manufactures, and Commerce, in London, and many others of a ſimilar kind. Hereby a ſpirit of diſcovery and improvement has been excited among the ingenious in almoſt every nation; knowledge of various kinds, and greatly uſeful to mankind, has taken place of the dry and unintereſting ſpeculations of ſchoolmen; and bold and erroneous hypotheſis has been obliged to give way to demonſtrative experiment. In ſhort, ſince the eſtabliſhment of theſe ſocieties, ſolid learning and philoſophy have more increaſed than they had done for many centuries before.

As to thoſe ſocieties eſtabliſhed for promoting induſtry, religion and morality, and relieving diſtreſs, the deſign is laudable and excellent, and preſents a beautiful picture of the philanthropy of modern times. We are happy to find, from the minutes of ſome of theſe ſocieties, that their beneficial effects are already conſpicuous.

We will now give ſome account of the moſt eminent ſocieties; arranging them under the three claſſes into which we have divided them: I. *Religious and Humane Societies.* II. *Societies for Promoting Science and Literature.* III. *Societies for Encouraging Arts, Manufactures*, &c.

I. Religious and Humane Societies.

1. *Society for the Propagation of the Goſpel in Foreign Parts*, was inſtituted by King William III. in 1701, in order to ſecure a maintenance for an orthodox clergy, and to make other proviſions for propagating the goſpel in the plantations, colonies, and factories beyond the ſeas. To that end he incorporated the archbiſhops, ſeveral of the biſhops, and others of the nobility, gentry, and clergy, to the number of 90, into one body, which, by the name of *The Society for the Propagation of the Goſpel in Foreign Parts*, was to plead and be impleaded; to have perpetual ſucceſſion, with privilege to purchaſe 2000l. a-year inheritance, and eſtates for lives or years, with other goods and chattels to any value. By its charter the ſociety is authoriſed to uſe a common ſeal, and to meet annually on the third Friday in February for the purpoſe of chooſing a preſident, vice-preſident, and officers for the year enſuing; and on the third Friday in every month, or oftener if there ſhould be occaſion, to tranſact buſineſs, and to depute perſons to take ſubſcriptions, and collect money contributed for the purpoſes aforeſaid; and of all moneys received and laid out, it is obliged to give account yearly to the lord-chancellor or keeper, the lord-chief-juſtice of the King's-bench, the lord-chief-juſtice of the Common-pleas, or to any two of theſe magiſtrates. Of this ſociety there is a ſtanding committee at St Paul's chapter-houſe, to prepare matters for the monthly meeting, which is held at St Martin's library.

Before the incorporation of the ſociety for the propagation of the goſpel in foreign parts, there had been formed, for the promoting of Chriſtian knowledge both at home and in the colonies, a voluntary aſſociation of perſons of rank and reſpectability, who in March 1699 began to hold ſtated meetings in London for that purpoſe, regulating themſelves by the laws of the land and the canons of the church; and when the new ſociety was formed, they had already tranſmitted to America and the Weſt Indies 800l. worth of Bibles, Books of Common Prayer, and treatiſes of practical religion, beſides ſecuring a tolerable maintenance to ſeveral clergymen on that continent. This aſſociation ſtill ſubſiſts under the denomination of *The Society for Promoting Chriſtian Knowledge*, and has been productive of much good in the cities of London and Weſtminſter; but upon the formation of the new ſociety, into which all its original members were incorporated by name, the care which the voluntary aſſociation had taken of the colonies devolved of courſe upon the incorporated ſociety; of which incorporation we believe the object has been ſometimes miſtaken, and the labours of its miſſionaries groſsly miſrepreſented. It has by many been ſuppoſed that the ſociety was incorporated for the *ſole* purpoſe of converting the ſavage Americans; and it has been much blamed for ſending miſſionaries into provinces where, in the common language of the complainers, a *goſpel-miniſtry* was already eſtabliſhed. But an impartial view of the riſe and progreſs of the American provinces, now become independent ſtates, will ſhow the folly and injuſtice of thoſe complaints.

The Engliſh colonies in North America were in the laſt century formed and firſt peopled by religious men; who made uneaſy at home by their intolerant brethren, left the *old world* to enjoy in peace that firſt and chief prerogative of man, *the free worſhip of God according to his own conſcience*. At one time Puritans were driven acroſs the Atlantic by the epiſcopal church; at another, Churchmen were forced away by the preſbyterians, juſt as the revolutions of ſtate threw the civil power into the hands of the one or the other party; and not a few

Religious and Humane Societies.

members of the CHURCH OF ROME were chafed to the wilds of America by the united exertions of both. It has been often obferved, that people perfecuted for their religion become for the moft part enthufiaftically attached to it; and the conduct of thofe colonifts was in perfect harmony with this obfervation. Their zeal, inflamed by their violent removal to the other hemifphere, kept religion alive and active among themfelves; but their poverty difabled them from fupplying fuel to the flame, by making provifion for a miniftry to inftruct their offspring. The confequence was, that the new Chriftian commonwealth, without the kindly affiftance of its mother-country, would have been, in the words of the Roman hiftorian, *Res unius ætatis*. Againft this danger a timely aid was to be provided by the fociety; which, as it confifted not of fanatical members, would not intruft the important bufinefs of the miffion to fanatical preachers, who, though always ready for fuch fpiritual enterprifes, are never qualified to carry them on with fuccefs.

It was therefore thought fit to affign a decent maintenance for clergymen of the church of England, who might preach the gofpel to their brethren in America: and though thofe miffionaries in general carefully avoided the conduct of thofe of Rome, whofe principal aim is to reduce all churches under fubmiffion to the papal tyranny; yet fo lately as 1765, did fome of the colonies, in which the puritanic fpirit of the laft century characterifed the church eftablifhed by law, raife a hideous outcry againft the fociety for fending a miffion into their quarters, though only for the fervice of the difperfed members of the Epifcopal church refiding among them, and for the converfion of thofe men whom their rigid fanaticifm had prejudiced againft Chriftianity itfelf.

Indeed the commodity called FREETHINKING, as Bifhop Warburton expreffes it, was at an early period imported by the opulent and fafhionable colonifts. The celebrated Berkeley, who had refided fome years in Rhode Ifland, and at his return was called upon to preach the anniverfary fermon before the fociety, informs us, that the ifland where he lived was inhabited by an Englifh colony, confifting chiefly of fectaries of many different denominations; that feveral of the better fort of the inhabitants of towns were accuftomed to affemble themfelves regularly on the Lord's day for the performance of divine worfhip; but that moft of thofe who were difperfed through the colony rivalled fome well-bred people of other countries, in a thorough indifference for all that is facred, being equally carelefs of outward worfhip and of inward principles. He adds, that the miffionaries had done, and were continuing to do, good fervice in bringing thofe planters to a ferious fenfe of religion. "I fpeak it knowingly (fays he), that the minifters of the gofpel, in thofe provinces which go by the name of New England, fent and fupported at the expence of the fociety, have, by their fobriety of manners, difcreet behaviour, and a competent degree of ufeful knowledge, fhown themfelves worthy of the choice of thofe who fent them." We have the honour to be acquainted with fome of the miffionaries fent at a later period, and have reafon to believe that, down to the era of the American revolution, they had the fame virtues, and were doing the fame good fervices, which procured to their predeceffors this honourable teftimony from one of the greateft and the beft of men. Surely fuch a miffion deferved not to be evil fpoken of by fectarifts of any denomination who believe in Chrift; efpecially as the very charter of incorporation affigns as a reafon for miffionaries being fent to the colonies, "that by reafon of their poverty thofe colonies were deftitute and unprovided of a MAINTENANCE for minifters and the public worfhip of God."

* See his *Sermon*, vol. ii. of his *Works*, 4to.

The fociety, however, was incorporated for other purpofes than this. It was obliged by its charter to attempt the converfion of the native Americans and the negro flaves; and we have reafon to believe, that, as foon as the fpiritual wants of the colonifts were decently fupplied, it was not inattentive to thefe glorious objects. Its fuccefs indeed in either purfuit has not been fo great as could be wifhed; but it would be rafh and unfair to attribute this failure to the prefident, vice-prefident, or other officers of the corporation at home. An erroneous notion, that the being baptized is inconfiftent with a ftate of flavery, rendered the felfifh colonifts for a long time averfe from the converfion of their negroes, and made them throw every obftacle in the way of all who made the attempt; while the difficulties of the Indian miffion are fuch as hardly any clergyman educated in a Proteftant country can be fuppofed able to furmount.

He who hopes fuccefsfully to preach the gofpel among a tribe of favage wanderers, muft have an ardent zeal and unwearied diligence; appetites fubdued to all the diftreffes of want; and a mind fuperior to all the terrors of mortality. Thefe qualities and habits may be acquired in the church of Rome by him who from infancy has been trained up in the feverities of fome of the monaftic orders, and afterwards fent to the college *de propaganda fide* to be inftructed in the languages, and inured to the manners and cuftoms, of the barbarous nations whofe converfion he is deftined to attempt. But in the reformed churches of Britain there are no monaftic orders, nor any college *de propaganda fide;* and yet without the regular preparation, which is to be looked for in fuch inftitutions alone, it is not in nature, whatever grace may effect, for any man cheerfully, and at the fame time foberly, to undergo all the accumulated diftreffes ever ready to overtake a faithful miffionary among favage idolaters. A fanatic zealot will indeed undertake it, though he is totally unqualified for every fober and important work; and a man of ruined fortunes may be preffed into the fervice, though the impotency of his mind has fhown him unable to bear either poverty or riches. The failure of the fociety therefore in its attempts to convert the American Indians may be attributed, we think, in the firft inftance, to the want of a college *de propaganda* for training up young men for the American miffion.

Perhaps another caufe of this failure may be found in the conduct of the miffionaries, who, it is to be prefumed, have not always employed in a proper manner even the fcanty qualifications which they actually poffeffed. The gofpel, plain and fimple as it is, and fitted in its nature for what it was ordained to effect, cannot be apprehended but by an intellect fomewhat raifed above that of a favage. Such of the miffionaries therefore as began their work with *preaching to favage and brutal men*, certainly fet out at the wrong end; for to make the gofpel underftood, and much more to propagate

Religious and Humane Societies.

gate and eſtabliſh it, thoſe ſavages ſhould have been firſt taught the neceſſary arts of civil life, which, while they improve every bodily accommodation, tend at the ſame time to enlarge and enlighten the underſtanding. For want of this previous culture, we doubt not, it hath happened that ſuch of the ſavages as have been baptized into the faith have ſo ſeldom perſevered themſelves, or been able in any degree to propagate among their tribes the Chriſtianity which they had been taught, and that ſucceſſive miſſions have always found it neceſſary to begin anew the work of converſion.

To one or other of theſe cauſes, or to both, may juſtly be attributed the little progreſs which reformed Chriſtianity has made among the Indians of North America; and not to any want of zeal, attention, or liberality, in the directors of the ſociety at home. During the dependence of the United States on the mother-country, great part of the ſociety's funds was properly expended in keeping alive a juſt ſenſe of religion among the Chriſtian coloniſts from Europe, who had ſurely the firſt claims upon this beſt of charities; but now that America has ſeparated herſelf from Great Britain, and ſhown that ſhe is able to maintain her independence, and to make ample proviſion for a regular clergy of her own, the members of the corporation muſt feel themſelves at liberty to beſtow greater attention, and to expend more money than they could formerly do, on the converſion of ſuch Indians as have any intercourſe with the ſettlements which we ſtill poſſeſs. To a body ſo reſpectable, we preſume not to offer advice; but we cannot help thinking, with Biſhop Berkeley, that the moſt ſucceſsful miſſionaries would be children of Indians, educated in a conſiderable number together from the age of ten or twelve in a college *de propaganda fide*, where they ſhould be in no danger of loſing their mother-tongue while they were acquiring a competent knowledge of religion, morality, hiſtory, practical mathematics, and agriculture. "If there were a yearly ſupply (ſays he) of a dozen ſuch miſſionaries ſent abroad into their reſpective countries, after they had received the degree of maſter of arts, and been admitted into holy orders, it is hardly to be doubted but that in a little time the world would ſee good and great effects of their miſſion."

Propoſal for the better ſupplying of Churches in our Foreign Plantations, &c.

2. *Society in Scotland for Propagating Chriſtian Knowledge*, was inſtituted in the beginning of the eighteenth century. At that period the condition of the Scotch Highlanders was truly deplorable. Shut up in deſolate iſlands by tempeſtuous ſeas, or diſperſed over a wide extent of country, interſected by high mountains, rapid rivers, and arms of the ſea, without bridges or highways, by which any communication could be kept open either with remote or neighbouring diſtricts, they lived in ſmall detached companies in hamlets or ſolitary huts. Being thus ſecluded from intercourſe with the more civilized part of the iſland, they could not enjoy the advantages of trade and manufactures. As their ſoil was barren and their climate ſevere, in agriculture no progreſs was to be expected: and as they were acquainted with no language but Gaelic, in which no books were then written, to poſſeſs knowledge was impoſſible. Their pariſhes being of great extent, often 30 or 40 miles long and of a proportionable breadth, and ſometimes conſiſting of ſeveral iſlands ſeparated by ſeas, which are often impaſſable, a conſiderable number of the inhabitants was entirely deprived of religious inſtruction or fell a prey to Popiſh emiſſaries. A ſingle ſchool in ſuch extenſive pariſhes could be of little benefit; yet many pariſhes were entirely deſtitute even of this reſource; and where ſchools were eſtabliſhed, the want of books prevented them from producing the uſeful effects otherwiſe to have been expected from them (A). To all this we muſt add, that they lived in a ſtate of the greateſt oppreſſion: For though the Highlands formed a part of the Britiſh empire, the bleſſings of the Britiſh conſtitution had not reached them. The feudal ſyſtem reigned in its utmoſt rigour; the chieftains exerciſing the moſt deſpotic ſway over the inferior Highlanders, whom at their pleaſure they deprived of their lives or property (B).

Thus the Highlanders were ignorant, oppreſſed, and uncivilized; ſlaves rather than ſubjects; and either entirely deſtitute of the advantages of the Chriſtian religion, or unqualified to improve them. Hitherto they had been unhappy and uſeleſs to themſelves and dangerous to the ſtate; for they were ready at the call of their chieftains to iſſue from their mountains, and to turn their arms againſt their lawful king and his loyal ſubjects. This character, however, aroſe from their ſituation. It was therefore impoſſible for benevolent minds to contemplate this unhappy ſituation of their countrymen without feeling a deſire to raiſe them to the dignity of rational beings, and to render them uſeful as citizens.

Accordingly, in the year 1701, ſome private gentlemen of the city of Edinburgh, who had formed themſelves into a ſociety for the reformation of manners, directed their attention to the Highlands of Scotland, and endeavoured to deviſe ſome plan for alleviating the diſtreſſes of the inhabitants. The remedy which promiſed to be moſt efficacious was, to eſtabliſh charity ſchools in different places, But as the exigency was great, it was no eaſy matter to raiſe a ſufficient fund for this purpoſe. They began therefore with what voluntary ſubſcriptions they could procure, hoping afterwards to increaſe their capital by vacant ſtipends and public contributions. A memorial with this view was preſented to the General Aſſembly in 1704, which received their approbation; and they accordingly paſſed an act, recommending a general contribution. In 1706 the General Aſſembly appointed ſome of their number to inquire more carefully into the ſtate of the Highlands, and the year following appointed a ſelect committee to confer with the gentlemen who had ſuggeſted the plan. The reſult of theſe conferences was the publication of propoſals "for propagating Chriſtian knowledge

(A) Even ſo late as the year 1758, not fewer than 175 pariſhes, within the bounds of 39 preſbyteries, had no parochial ſchool. We are ſorry to add, that even in the preſent enlightened and benevolent age the complaint is not entirely removed.

(B) The feudal ſyſtem was at length aboliſhed in the year 1748 by the juriſdiction act.

Religious and Humane Societies.

ledge in the Highlands and Iſlands of Scotland, and in foreign parts of the world." Copies of theſe propoſals, with ſubſcription papers, were diſtributed through the kingdom; and the contributions having ſoon amounted to 1000l. her majeſty Queen Anne encouraged this infant ſociety by her royal proclamation, and at the ſame time iſſued letters patent under the great ſeal of Scotland for erecting certain of the ſubſcribers in to a corporation; the firſt nomination of whom was lodged with the lords of council and ſeſſion.

This corporation held its firſt meeting on Thurſday 3d November 1709. It was attended by ſeveral of the nobility, fourteen of the lords of ſeſſion, many gentlemen of rank, together with moſt of the miniſters of the city of Edinburgh and neighbourhood. A preſident, ſecretary, and treaſurer, with a committee of fifteen directors, were appointed for the diſpatch of buſineſs. At their ſecond meeting in January 1710, a ſcheme of management was formed and approved; in which it was propoſed, 1. To erect and maintain ſchools in ſuch places of Scotland, particularly in the Highlands and Iſlands, as ſhould be found to need them moſt; in which ſchools all perſons whatſoever ſhould be taught by fit and well qualified ſchoolmaſters, appointed by the ſociety, to read the Holy Scriptures and other pious books; as alſo to write, and to underſtand the common rules of arithmetic, with ſuch other things as ſhould be thought ſuitable to their circumſtances. 2. That the ſchoolmaſters ſhould be particularly careful to inſtruct their ſcholars in the principles of the Chriſtian reformed religion; and for that end ſhould be obliged to catechiſe them at leaſt twice a week, and to pray publicly with them twice a-day. 3. That not only ſuch as were unable to pay ſhould be taught gratis, but that thoſe whoſe circumſtances required it, ſhould have ſuch farther encouragement as the ſociety ſhould think fit in a conſiſtency with their patent. 4. To name ſome prudent perſons, miniſters and others, to be overſeers of thoſe ſchools, who ſhould take care that the ſchoolmaſters do their duty, and that the inſtructions to be given from time to time by the ſociety or their committee be punctually obſerved; which overſeers ſhould make their report to the ſociety quarterly or half-yearly at fartheſt. 5. To give ſuitable encouragement to ſuch miniſters or catechiſts as ſhould be willing to contribute their aſſiſtance towards the farther inſtruction of the ſcholars remote from church, by not only catechiſing, but preaching to them; which miniſters or catechiſts ſhould take the ſame care of the other inhabitants as of the ſcholars. 6. To extend their endeavours for the advancement of the Chriſtian religion to heathen nations; and for that end to give encouragement to miniſters to preach the goſpel among them.

Having thus formed a plan, they immediately proceeded to eſtabliſh ſchools in the moſt uſeful and economical manner; and as the capital continued to accumulate, the intereſt was faithfully applied, and the utility of the inſtitution was more extenſively diffuſed.

Until the year 1738 the attention of the ſociety had been wholly directed to the eſtabliſhment of ſchools; but their capital being then conſiderably augmented, they began to extend their views of utility much farther. The grand object of all public aſſociations ought certainly to be the promoting of religion and morality. It muſt, however, be evident to every man of reflection, that theſe can neither be propagated nor preſerved among a people without agriculture, unaccuſtomed to commerce and manufactures, and conſequently without labour or exertion. Languor and debility of mind muſt always be the companions of idleneſs. While the Highlanders roved about with arms in their hands, the latent vigour of their minds muſt often have been called forth into action; but when their arms were taken away, and themſelves confined to a domeſtic life, where there was nothing to rouſe their minds, they muſt have ſunk into indolence and inactivity. All attempts therefore to inſtruct them in religion and morality, without introducing among them ſome of the neceſſary arts of life, would probably have been unavailing. The ſociety accordingly reſolved to adopt what appeared to them the moſt effectual methods of introducing induſtry among the Highlanders. But as their patent did not extend far enough, they applied to his majeſty George II. for an enlargement of their powers; and accordingly obtained a ſecond patent, by which they are empowered, "beſides fulfilling the purpoſes of their original patent, to cauſe ſuch of the children as they ſhall think fit to be bred to huſbandry and houſewifery, to trades and manufactures, or in ſuch manual occupations as the ſociety ſhall think proper."

The objects of this ſecond patent the ſociety have not failed to purſue; and though many obſtacles and diſcouragements to their efforts occurred among a rude and barbarous people, yet their perſeverance, and the obvious utility of their plans, at length ſo far overcame the reluctance of the inhabitants, that not fewer than 94 ſchools of induſtry in various parts of the Highlands and Iſlands are now upon their eſtabliſhment, at which are educated 2360 ſcholars.

The ſociety, while anxiouſly endeavouring to diffuſe a ſpirit of induſtry through the Highlands, were ſtill equally ſolicitous to promote the knowledge of the Chriſtian religion. As the Engliſh language had been the only channel by which knowledge was conveyed to them (a language which, being not uſed in converſation, was in all reſpects foreign to them), it was judged requiſite that they ſhould have the Scriptures in their vernacular tongue. The ſociety therefore firſt appointed a tranſlation of the New Teſtament to be made into Gaelic: A tranſlation was accordingly undertaken by the Rev. Mr Stewart miniſter of Killin in Perthſhire, and printed in 1767, which is ſaid to be executed with much fidelity. Of this work many thouſand copies have been diſtributed in the Highlands. The greater part of the Old Teſtament has alſo been tranſlated by the Rev. Dr Smith of Campbelton and others, but chiefly by the Rev. Dr Stewart of Luſs, by the appointment and at the expence of the ſociety: and as ſoon as the remaining part can be got ready, the whole will be ſold at ſo low a price as the poor may without difficulty afford. This plan the ſociety have judiciouſly choſen, in order to prevent diſcontent and murmuring; effects which the diffuſion of the Scriptures ought never to produce; but which could not poſſibly have been prevented, had the diſtribution been gratuitous, and of courſe partial.

For ſome years paſt the funds of the ſociety have ra-

Religious and Humane Societies.

pidly accumulated, from the very liberal donations of several individuals.

Lady Glenorchy -	L. 5,000
By a person unknown -	10,000
Lord Van Vryhouven of Holland	20,000
Miss Gray of Teasses -	3,500

In consequence of these great additions to their stock, insinuations have been thrown out that the society have become so wealthy as to be at a loss for proper objects on which to bestow their increased revenue. If such an opinion be *seriously* entertained by any one, we must beg him to remember, that the society have erected and endowed not fewer than 323 schools for religion, the first principles of literature and industry, at the annual expence of 3214l. 10s. sterling; and that at these seminaries are educated from 14,000 to 15,000 children; who, but for the means of instruction thus obtained, would in all probability be bred up in ignorance and idleness: That they employ 12 missionary ministers and catechists in remote parts of the Highlands and islands, or among the ignorant Highlanders settled in the great towns of Scotland, at the annual expence of 296l.: That they bestow a bursary or pension of 15l. per annum on each of six students of divinity having the Gaelic language: That they employ two missionary ministers and one schoolmaster among the Oneida and Stockbridge Indians of North America (being the destination of certain legacies bequeathed to them for that purpose), at the annual expence of 140l. Such is their fixed scheme of annual expenditure, amounting in all to 3740l., 10s. sterling—a sum it will be acknowledged of very considerable magnitude. The whole of their incidental expences arising from the Gaelic translation of the Scriptures of the Old Testament; from annuities which they have to pay, in consequence of sums left them as residuary legatees; from land and house taxes; from enabling candidates for the office of schoolmaster to come to Edinburgh for examination; from furnishing books to poor scholars in their various schools; and from removing schoolmasters from one station to another, is generally about 875l., which added to the former sum makes the whole annual expence amount to 4615l. 10s.

If it be inquired at what expence, in the *management* of it, this extensive and complicated charity is annually conducted, we are authorised to say, that the treasurer, bookholder, and clerk, are allowed each 25l. per annum, the same salaries which were annexed to these offices from the commencement of the society. The beadle or officer is allowed 12l. per annum. No salary whatever is enjoyed by any of the other officers of the society. The secretary, comptroller, accountant, and librarian, although subjected, some of them especially, to no small expence of time and labour, have no pecuniary recompense or emolument. Theirs are labours of love, for which they seek and expect no other reward than the consciousness of endeavouring to promote the best interests of mankind. The whole amount of the expence of managing the business of the society, including the above salaries, and coals, candle, stationary ware, postages, and other incidents, exceeds not at an average 115l. per annum. From this statement it appears, that hitherto at least the directors have been at no loss for important objects within the proper sphere of their institution on which to bestow their increased funds. They have, it is true, the disposal of very considerable sums for promoting the objects of the institution; but they are so far from accumulating wealth, that every year their expenditure, notwithstanding the late increase of their capital, exceeds rather than falls short of their income. They have depended upon a kind Providence and a generous public to refund these anticipations of their revenue, and hitherto they have never been disappointed.

Thus has the Society for Propagating Christian Knowledge proceeded for almost a century. It was founded by the pious exertions of a few private individuals, whose names are unknown to the world; and its funds, by faithful and judicious management, as well as by generous contributions, have now become of such magnitude, as to excite the hope that they will be productive of the most valuable effects. The benefits arising from public societies, it is well known, depend entirely upon the management of their directors. If so, the advantages which have accrued from this society intitle it to the praise and gratitude of the nation. While eager to increase the number of schools, the society have not been inattentive to their prosperity. In the year 1771 Mr Lewis Drummond, a gentleman in whom they placed great confidence, was commissioned by them to visit their schools, and to make an exact report of their state and circumstances. Again, in the year 1790, a commission was granted to the Rev. Dr Kemp, one of the ministers of Edinburgh and secretary to the society, to visit all the schools on their establishment. This laborious and gratuitous task he accomplished in the course of four summers with much ability and care, and highly to the satisfaction of the society. At his return he communicated a variety of important information respecting the state of the Highlands and Islands, and the means necessary for their improvement in religion, literature, and industry; an abstract of which was published by the society in appendixes to the anniversary sermons preached before them in the years 1789, 90, 91, and 92 (c)

The following table will exhibit at a glance the funds, establishment, and expenditure, of the society, from a few years after its commencement to the present time. Where

(c) It is well known, that the number of Roman Catholics in the Highlands is considerable; but it must give much pleasure to the Protestant reader to be informed, that the ancient malignant spirit of Popery has in that district given place to mildness and liberality. This is chiefly owing to the gentleman who superintends the priests in that quarter, whose mind is enlightened by science and learning. So far from being hostile to the views of the society, he recommended to his clergy to promote them. They accordingly received the secretary with much politeness; exhorted the people to send their children to the Protestant schools to be instructed in literature, to be taught to read the Scriptures in their own language, and to be made acquainted with those great principles of religion in which all Christians are agreed. What a blessed reformation!

Religious and Humane Societies.

Where the number of fcholars is not mentioned, the defect may be fupplied by taking an average from thofe years where a computation has been made. Where the capital is not mentioned, it may eafily be made out by confidering the falaries as the intereft.

Hitherto we have taken no notice of the correfponding board which was eftablifhed at London fo early as the year 1729, to receive fubfcriptions and lay out fums. That board indeed remained long inactive; but in 1773 its members began to co-operate more cordially with their brethren in Scotland. Since that period an annual fermon has been preached in recommendation of the charity; and the preacher is now felected without any regard to the religious denomination to which he belongs; fometimes from the church of England, fometimes from the church of Scotland, and fometimes from fectaries of different perfuafions. The meetings of the correfpondent board have been attended by many of the nobility and gentry, who have made great exertions to promote the views of the fociety. From its prefent flourifhing ftate therefore, from the indefatigable exertion and laudable zeal of the managers, and from the countenance and fupport which they have received from perfons of the firft rank and refpectability in the nation, the benevolent mind may look forward with much confidence and fatisfaction to a period not very diftant, when its beneficial effects fhall be felt not only in the Highlands, but fhall be communicated to the reft of the nation. We have been thus particular in our account of the Society for Propagating Chriftian Knowledge, becaufe we have had accefs to the moft authentic fources of information, and becaufe we know it to be an inftitution calculated to enlighten and improve a confiderable part of the Britifh nation.

3. *Society of the Sons of the Clergy*, was incorporated by King Charles II. in 1678, by the name of *The Governors of the Charity for Relief of the Poor Widows and Children of Clergymen.* This fociety is under the direction and management of a prefident and vice prefident, three treafurers, and a court of affiftants compofed of forty members. Several hundreds of widows and children of the clergy have annually received confiderable relief from this ufeful charity.

4. *Society for the Sons of the Clergy of the Eftablifhed Church of Scotland*, was inftituted at Edinburgh in February 1790, and was conftituted a body corporate by his majefty's royal charter in 1792. The fociety, after feveral meetings, are of opinion, that the period in which the families of clergymen feel moft urgently the need both of friends and of pecuniary aid, is that which commences with the introduction of the fons either to an univerfity or to bufinefs, and terminates with their eftablifhment in their refpective profeffions; that many of the minifters of this church, living at great diftances from the feats either of univerfities or of bufinefs, poffefs incomes which, in the prefent ftate of the country, are inadequate to the purpofes of procuring for their fons either the literary or profeffional education which might enable them to come forward with credit and fuccefs in the world; that the fons of clergymen, from domeftic tuition and example, have in general very advantageous means of receiving in their early years the impreffions of virtue and honour, together with the rudiments of liberal knowledge; and that of courfe the public intereft may be promoted, by enabling this clafs of young men to obtain their fhare in the refpectable fituations of life. The views of the fociety have been limited to the fons only of clergymen; as they are of opinion, that within the limits which they have fixed, the field of beneficence will be ftill very extenfive, and the claims for aid as many and as great as their funds can be fuppofed able to anfwer, at leaft for many years to come. If the fociety fhall ever be in a fituation to undertake more than the aids which will be neceffary in bringing forward the fons of the clergy, it may then be confidered in what manner the daughters alfo may become fharers in its bounty.

A fociety of the fame nature, and having the fame objects in view, was inftituted at Glafgow we think the year before; and both focieties, we know, have in many cafes proved highly beneficial in promoting the views for which they were inftituted.

5. *Royal Humane Society*, was inftituted in London in 1774, for the recovery of perfons drowned or otherwife fuffocated. We have already given fome account of focieties inftituted in other countries with the fame views, and have alfo copied the directions of this fociety for the recovery of life, for which fee the article DROWNING. We have therefore only to ftate, that the plan of this fociety is fo averfe to any private interefted views, that it acquits its founders of all fordid motives. For the medical practitioners accept no pecuniary recompenfe for the time which they devote to a difficult and tedious procefs; for the anxiety which they feel while the event is doubtful: for the mortification which they too often undergo, when death, in fpite of all their efforts, at laft carries off his prey; nor for the infults to which they willingly expofe themfelves from vulgar incredulity. Their fole reward is in the holy joy of doing good. Of an inftitution thus free in its origin from the fufpicion of ambitious views, and in its plan renouncing felf-intereft in every fhape, philanthropy muft be the only bafis. The good intention therefore of the fociety is proved by its conftitution; the wifdom and utility of the undertaking are proved by its fuccefs: not fewer than 3000 fellow-creatures having fince its commencement been (1794) reftored to the community by its timely and indefatigable exertions. For it is to be obferved, that the benefit of this fociety is by no means confined to the two cafes of drowning and fufpenfion. Its timely fuccours have roufed the lethargy of opium taken in immoderate and repeated dofes; they have refcued the wretched victims of intoxication; rekindled the life extinguifhed by the fudden ftroke of lightning; recovered the apoplectic; reftored life to the infant that had loft it in the birth; they have proved efficacious

Religious and Humane Societies.

efficacious in cases of accidental smothering and of suffocation by noxious damps; in instances in which the tenderness of the infant body or the debility of old age greatly lessened the previous probability of success: insomuch that no species of death seems to be placed beyond the reach of this society's assistance, where the mischief had gone no farther than an obstruction of the movements of the animal machine without any damage of the organs themselves. In consequence of every necessary assistance afforded by this society, similar institutions have been established at Algiers, Lisbon, Philadelphia, Boston, Jamaica, Dublin, Leith, Glasgow, Paisley, Aberdeen, Birmingham, Gloucester, Shropshire, Northamptonshire, Lancaster, Bristol, Whitehaven, Norwich, Exeter, Kent, and Newcastle. The society has published an 8vo volume with plates, consisting of cases, correspondence, and a variety of interesting matter relating to the object of this benevolent institution.

6. *The Philanthropic Society*, was instituted in September 1788. It aims at the prevention of crimes, by removing out of the way of evil counsel, and evil company, those children who are, in the present state of things, destined to ruin. It proposes to educate and instruct in some useful trade or occupation the children of convicts or other infant poor who are engaged in vagrant or criminal courses; thus to break the chain of those pernicious confederacies, deprive the wicked of successors, the gaols of inhabitants, justice of its victims, and by all these means add citizens to society. This institution is not only calculated to decrease vice and infamy, but to increase useful industry; so that those children who would otherwise succeed to their parents hereditary crimes, and become the next race of beggars and thieves, will now be taught to supply by honest means their own wants and the wants of others.

To carry into effect these desirable purposes, it is the first business of the society to select from prisons, and from the haunts of vice, profligacy, and beggary, such objects as appear most likely to become obnoxious to the laws, or prejudicial to the community; and, in the execution of this duty, the assistance of the magistrates, the clergy, and all who are interested in the promotion of good morals and good government, is most earnestly requested. For the employment of the children, several houses are supported, at Cambridge Heath, near Hackney, in each of which a master-workman is placed for the purpose of teaching the children some useful trade. The trades already established are those of a printer, carpenter, shoemaker, and taylor. The girls are at present educated as menial servants.

In the year 1791 not fewer than 70 children were under the protection of this society, among whom were many who have been guilty of various felonies, burglaries, and other crimes. Yet, singular as it may appear, in less than two years those very children became no less remarkable for industry, activity, decency, and obedience, than they formerly were for the contrary vices. Such are the grounds on which the Philanthropic Society now claims the attention and solicits the patronage of the public. If we regard humanity and religion, this institution opens an asylum to the most forlorn and abject of the human race; it befriends the most friendless; it saves from the certain and fatal consequences of infamy and vicious courses orphans and deserted children. If we regard national prosperity and the public welfare, it is calculated to increase industry; and it directs that industry into the most useful and necessary channels. If we regard self-interest, its immediate object is to protect our persons from assault and murder, our property from depredation, and our peaceful habitations from the desperate fury of midnight incendiaries.

One guinea per annum constitutes a member of the society; and 10l. at one payment a member for life. A life-subscription, or an annual payment of at least two guineas, is a necessary qualification for being elected into the committee.

II. Societies for Promoting Science and Literature.

1. *The Royal Society of London* is an academy or body of persons of eminent learning, instituted by Charles II. for the promoting of natural knowledge. The origin of this society is traced by Dr Sprat, its earliest historian, no farther back than to "some space after the end of the civil wars" in the 17th century. The scene of the first meetings of the learned men who laid the foundation of it, is by him fixed in the university of Oxford at the lodgings of Dr Wilkins warden of Wadham college. But Dr Birch, on the authority of Dr Wallis, one of its earliest and most considerable members, assigns it an earlier origin. According to him, certain worthy persons, residing in London about the year 1645, being "inquisitive into natural and the new and experimental philosophy, agreed to meet weekly on a certain day, to discourse upon such subjects, and were known by the title of *The Invisible* or *Philosophical College*." In the years 1648 and 1649, the company who formed these meetings was divided, part retiring to Oxford and part remaining in London; but they continued the same pursuits as when united, corresponding with each other, and giving a mutual account of their respective discoveries. About the year 1659 the greater part of the Oxford society returned to London, and again uniting with their fellow-labourers, met once, if not twice, a-week at Gresham college, during term time, till they were scattered by the public distractions of that year, and the place of their meeting made a quarter for soldiers. On the restoration 1660 their meetings were revived, and attended by a greater concourse of men eminent for their rank and learning. They were at last taken notice of by the king, who having himself a considerable taste for physical science, was pleased to grant them an ample charter, dated the 15th of July 1662, and afterwards a second dated 15th April 1763, by which they were erected into a corporation, consisting of a president, council, and fellows, for promoting natural knowledge; and to give their investigations, against which strange prejudices were entertained, every possible support, he sometimes honoured their meetings with his presence.

Their manner of electing fellows is by balloting. Their council are in number 21, including the president, vice-president, treasurer, and two secretaries; 11 of which are continued for the next year, and 10 more added to them; all chosen on St Andrew's day. Each member at his admission subscribes an engagement that he will endeavour to promote the good of the society, from which he may be freed at any time, by signifying to the president that he desires to withdraw. The charges have been different at different times, and were at were at first irregularly paid: but they are now five guineas paid to the treasurer at admission, and 13s. per quarter so long as the person continues a member; or, in lieu of the annual subscription, a composition of 25 guineas in one payment.

Their design is, to "make faithful records of all the works of nature or art which come within their reach; so that the present as well as future ages may be enabled to put a mark on errors which have been strengthened by long prescription; to restore truths that have been neglected; to push those already known to more various uses; to make the way more passable to what remains unrevealed," &c. To this purpose they have made a great number of experiments and observations on most of the works of nature; and also numbers of short histories of nature, arts, manufactures, useful engines, contrivances, &c. The services which they have rendered to the public are very great. They have improved naval, civil, and military architecture; advanced the security and perfection of navigation; improved agriculture; and put not only this kingdom, but also Ireland, the plantations, &c. upon planting. They have registered experiments, histories, relations, observations, &c. and reduced them into one common stock; and have, from time to time, published those which they reckoned most useful, under the title of *Philosophical Transactions*, &c. and laid the rest up in public registers, to be nakedly transmitted to posterity, as a solid groundwork for future systems.

They have a library adapted to their institution; towards which Mr Henry Howard, afterwards duke of Norfolk, contributed the Norfolcian library, and which is, at this time, greatly increased by a continual series of benefactions. The museum or repository of natural and artificial rarities, given them by Daniel Colwal, Esq. and since enriched by many others, is now removed to the British museum, and makes a part of that great repository. Their motto is *Nullius in verba;* and their place of assembling is Somerset-house in the Strand. Sir Godfrey Copley, baronet, left five guineas to be given annually to the person who should write the best paper in the year, under the head of experimental philosophy. This reward, which is now changed to a gold medal, is the highest honour the society can bestow. It is conferred on St Andrew's day.

2. *The Royal Society of Edinburgh*, was incorporated by royal charter on the 29th of March 1783, and has for its object the cultivation of every branch of science, erudition, and taste. Its rise and progress towards its present state was as follows: In the year 1718 a literary society was established in Edinburgh by the learned Ruddiman and others, which in 1731 was succeeded by a society instituted for the improvement of medical knowledge. In the year 1739 the celebrated Maclaurin conceived the idea of enlarging the plan of this society, by extending it to subjects of philosophy and literature. The institution was accordingly new-modelled by a printed set of laws and regulations, the number of members was increased, and they were distinguished from that time by the title of *The Society for Improving Arts and Sciences*, or more generally by the title of *The Philosophical Society of Edinburgh*. Its meetings, however, were soon interrupted by the disorders of the country during the rebellion in 1745; and they were not renewed till the year 1752. Soon after this period the first volume of the Transactions of the Philosophical Society of Edinburgh was published, under the title of *Essays and Observations, Physical and Literary*, and was followed by other volumes of acknowledged merit. About the end of the year 1782, in a meeting of the professors of the university of Edinburgh, many of whom were likewise members of the Philosophical Society, and warmly attached to its interests, a scheme was proposed by the Rev. Dr Robertson, principal of the university, for the establishment of a new society on a more extended plan, and after the model of some of the foreign academies. It appeared an expedient measure to solicit the royal patronage to an institution of this nature, which promised to be of national importance, and to request an establishment by charter from the crown. The plan was approved and adopted; and the Philosophical Society, joining its influence as a body in seconding the application from the university, his majesty, as we have already observed, was most graciously pleased to incorporate The Royal Society of Edinburgh by charter.

This society consists of ordinary and honorary members; and the honorary places are restricted to persons residing out of Great Britain and Ireland. The election of new members is appointed to be made at two stated general meetings, which are to be held on the fourth Monday of January and the fourth Monday of June. A candidate for the place of an ordinary member must signify by a letter, addressed to one of the members, his wish to be received into the society. He must then be publicly proposed at least a month before the day of election. If the proposal be seconded by two of the members present, his name is to be inserted in the list of candidates, and hung up in the ordinary place of meeting. The election is made by ballot, and is determined in favour of a candidate, if he shall have the votes of two-thirds of those present, in a meeting consisting of at least 21 members. The general business of the society is managed by a president, two vice-presidents, with a council of 12, a general secretary, and a treasurer. These officers are chosen by ballot annually on the last Monday of November. All public deeds, whether of a civil or of a literary nature, are transacted by this board, and proceed in the name of the president or vice-president.

As it was thought that the members would have a greater inducement to punctual attendance on the meetings of the society, if they had some general intimation of the nature of the subjects which were to be considered, and made the topics of conversation, it was therefore resolved to divide the society into two classes, which should meet and deliberate separately. One of these classes is denominated the *Physical Class*, and has for its department the sciences of mathematics, natural philosophy, chemistry, medicine, natural history, and whatever relates to the improvement of arts and manufactures. The other is denominated the *Literary Class*, and has for its department literature, philology, history, antiquities, and speculative philosophy. Every member is desired at his admission to intimate which of those classes he wishes to be more particularly associated with; but he is at the same time intitled to attend the meetings of the other class, and to take part in all its proceedings. Each of the classes has four presidents and two secretaries, who officiate by turns. The meetings of of the phyfical clafs are held on the firft Mondays of January, February, March, April, July, Auguft, November, and December; and the meetings of the Literary clafs are held on the third Mondays of January, February, March, April, June, July, November, and December, at 7 o'clock afternoon.

At thefe meetings the written effays and obfervations of the members of the fociety, or their correfpondents, are read publicly, and become the fubjects of converfation. The fubjects of thefe effays and obfervations are announced at a previous meeting, in order to engage the attendance of thofe members who may be particularly interefted in them. The author of each differtation is likewife defired to furnifh the fociety with an abftract of it, to be read at the next enfuing meeting, when the converfation is renewed with increafed advantage, from the knowledge previoufly acquired of the fubject. At the fame meetings are exhibited fuch fpecimens of natural or artificial curiofities, fuch remains of antiquity, and fuch experiments, as are thought worthy of the attention of the fociety. All objects of natural hiftory prefented to the fociety, are ordered by the charter of the inftitution to be depofited, on receipt, in the mufeum of the univerfity of Edinburgh; and all remains of antiquity, public records, or ancient manufcripts, in the library belonging to the faculty of advocates at Edinburgh.

The ordinary members, whofe ufual refidence is in the city of Edinburgh or its immediate neighbourhood, are expected to attend regularly the monthly meetings; and are required to defray, by an annual contribution, the current expences of the inftitution. The members who refide at fuch a diftance from Edinburgh, that they cannot enjoy the advantages arifing from a regular attendance on the meetings of the fociety, are not fubjected to any contribution for defraying its expences, but have a right to attend thofe meetings when occafionally in Edinburgh, and to take part in all their proceedings.

Five volumes of the Tranfactions of the fociety have been publifhed, which bear ample teftimony to the learning and acutenefs of their various authors.

3. *Medical Society* of London, inftituted in the year 1752, on the plan recommended by Lord Bacon (*De Augm. Scient.* lib. iv. cap. 2.), to revive the Hippocratic method of compofing narratives of particular cafes, in which the nature of the difeafe, the manner of treating it, and the confequences, are to be fpecified; to attempt the cure of thofe difeafes which, in his opinion, have been too boldly pronounced incurable; and, laftly, to extend their inquiries after the powers of particular medicines in the cure of particular cafes; the collections of this fociety have been already publifhed, under the title of *Medical Obfervations and Inquiries*, in feveral volumes.

4. *The Medical Society* of Edinburgh was incorporated by royal charter in 1778; but there appears to have been in that city a voluntary affociation of the fame name from the firft eftablifhment of a regular fchool of phyfic in the univerfity. To the voluntary fociety the public is indebted for fix volumes of curious and ufeful effays, collected principally by the late Dr Monro from June 1731 to June 1736; but in the year 1739 that fociety was united to another, as we have already obferved in a former article. The ordinary members of the prefent medical fociety are elected by ballot, and three diffentients exclude a candidate; an ordinary member may alfo be elected an honorary member, who enjoys the privileges of the others, and receives a diploma, but is freed from the obligation of attendance, delivering papers in rotation, &c. to which the ordinary members are fubject; but in this cafe the votes muft be unanimous. The meetings of this fociety are held every Friday evening (formerly Saturday) in their own hall, during the winter feafon, when papers on medical fubjects are delivered by the feveral members in rotation; and four of thefe are annually elected to fill the chair in rotation, with the title of annual prefidents. This fociety poffeffes an excellent library of books on fubjects connected with its purfuits.

5. The *Royal Medical Society* of Paris was inftituted in 1776. The members are divided into affociates ordinary, limited to 30, honorary to 12, extraordinary to 60, and foreign to 60, and correfpondents. This fociety has publifhed feveral volumes of Memoirs in 4to.

6. *Afiatic Society*, an inftitution planned by the late illuftrious Sir William Jones, and actually formed at Calcutta on the 15th of January 1784, for the purpofe of tracing the hiftory, antiquities, arts, fciences, and literature, of the immenfe continent of Afia. As it was refolved to follow as nearly as poffible the plan of the ROYAL SOCIETY of London, of which the king is *patron*, the patronage of the Afiatic Society was offered to the governor-general and council, as the executive power in the territories of the company. By their acceptance of this offer, Mr Haftings, as governor-general, appeared among the patrons of the new fociety; "but he feemed in his private ftation, as the firft liberal promoter of ufeful knowledge in Bengal, and efpecially as the great encourager of Perfian and Shanfcrit literature, to deferve a particular mark of diftinction:" he was requefted, therefore, to accept the honorary title of prefident. This was handfomely declined in a letter from Mr Haftings, in which he requefted "to yield his pretenfions to the gentleman whofe genius planned the inftitution, and was moft capable of conducting it to the attainment of the great and fplendid purpofes of its formation." On the receipt of this letter, Sir William Jones was nominated prefident of the fociety; and we cannot give the reader a view of the object of the inftitution in clearer language than that which he employed in his firft difcourfe from the chair.

"It is your defign, I conceive (faid the prefident), to take an ample fpace for your learned inveftigations, bounding them only by the geographical limits of Afia; fo that, confidering Hindoftan as a centre, and turning your eyes in idea to the north, you have on your right many important kingdoms in the eaftern peninfula, the ancient and wonderful empire of China with all her Tartarian dependencies, and that of Japan, with the clufter of precious iflands, in which many fingular curiofities have too long been concealed: before you lies that prodigious chain of mountains, which formerly perhaps were a barrier againft the violence of the fea, and beyond them the very interefting country of Tibet, and the vaft regions of Tartary, from which, as from the Trojan horfe of the poets, have iffued fo many confummate warriors, whofe domain has extended at leaft from the banks of the Ilyffus to the mouths of the Ganges: on your left are the beautiful and celebrated provinces of

Societies for Promoting Science and Literature.

of Iran or Persia, the unmeasured and perhaps unmeasurable deserts of Arabia, and the once flourishing kingdom of Yemen, with the pleasant isles that the Arabs have subdued or colonized; and farther westward, the Asiatic dominions of the Turkish sultans, whose moon seems approaching rapidly to its wane. By this great circumference the field of your useful researches will be inclosed; but since Egypt had unquestionably an old connection with this country, if not with China, since the language and literature of the Abyssinians bear a manifest affinity to those of Asia, since the Arabian arms prevailed along the African coast of the Mediterranean, and even erected a powerful dynasty on the continent of Europe, you may not be displeased occasionally to follow the streams of Asiatic learning a little beyond its natural boundary; and, if it be necessary or convenient that a short name or epithet be given to our society, in order to distinguish it in the world, that of *Asiatic* appears both classical and proper, whether we consider the place or the object of the institution, and preferable to *Oriental*, which is in truth a word merely relative, and though commonly used in Europe, conveys no very distinct idea.

"If now it be asked, What are the intended objects of our inquiries within these spacious limits? we answer, MAN and NATURE; whatever is performed by the *one* or produced by the *other*. Human knowledge has been elegantly analysed according to the three great faculties of the mind, *memory*, *reason*, and *imagination*, which we constantly find employed in arranging and retaining, comparing and distinguishing, combining and diversifying, the ideas, which we receive through our senses, or acquire by reflection: hence the three main branches of learning are, *history*, *science*, and *art*; the first comprehends either an account of natural productions, or the genuine records of empires and states, the second embraces the whole circle of pure and mixed mathematics, together with ethics and law, as far as they depend on the reasoning faculty; and the third includes all the beauties of imagery and the charms of invention, displayed in modulated language, or represented by colour, figure, or sound.

"Agreeably to this analysis, you will investigate whatever is rare in the stupendous fabric of nature, will correct the geography of Asia by new observations and discoveries; will trace the annals and even traditions of those nations who from time to time have peopled or desolated it; and will bring to light their various forms of government, with their institutions civil and religious; you will examine their improvements and methods in arithmetic and geometry; in trigonometry, mensuration, mechanics, optics, astronomy, and general physics; their systems of morality, grammar, rhetoric, and dialectic; their skill in chirurgery and medicine; and their advancement, whatever it may be, in anatomy and chemistry. To this you will add researches into their agriculture, manufactures, trade; and whilst you inquire with pleasure into their music, architecture, painting, and poetry, will not neglect those inferior arts by which the comforts and even elegancies of social life are supplied or improved. You may observe, that I have omitted their languages, the diversity and difficulty of which are a sad obstacle to the progress of useful knowledge; but I have ever considered languages as the mere instruments of real learning, and think them improperly confounded with learning itself: the attainment of them is, however, indispensably necessary; and if to the Persian, Armenian, Turkish, and Arabic, could be added not only the Shanscrit, the treasures of which we may now hope to see unlocked, but even the Chinese, Tartarian, Japanese, and the various insular dialects, an immense mine would then be open, in which we might labour with equal delight and advantage."

Of this society three volumes of the Transactions have been published, which are replete with information in a high degree curious and important; and we hope that the European world shall soon be favoured with another. The much-to-be-lamented death of the accomplished president may indeed damp the spirit of investigation among the members; for to conquer difficulties so great as they must meet with, a portion seems to be necessary of that enthusiasm which accompanied all the pursuits of Sir William Jones; but his successor is a man of great worth and learning, and we trust will use his utmost endeavours to have the plan completed of which Sir William gave the outlines.

5. *The American Philosophical Society*, held at Philadelphia, was formed in January 1769 by the union of two societies which had formerly subsisted in that city. This society extends its attention to geography, mathematics, natural philosophy, and astronomy; medicine and anatomy; natural history and chemistry; trade and commerce; mechanics and architecture; husbandry and American improvements. Its officers are a patron, president, three vice-presidents, one treasurer, four secretaries, and three curators, who are annually chosen by ballot. The duty of the president, vice-presidents treasurer, and secretaries, is the same as in other societies. The business of the curators is to take the charge of all specimens of natural productions, whether of the animal, vegetable, or fossil kingdom; all models of machines and instruments; and all other matters belonging to the society which shall be intrusted to them. The ordinary meetings are held on the first and third Fridays of every month from October to May inclusive. This society was incorporated by charter 15th March 1780; and has published three volumes of its Transactions, containing many ingenious papers on general literature and the sciences, as well as respecting those subjects peculiar to America. It is a delightful prospect to the philosopher to consider, that Asia, Europe, and America, though far separated and divided into a variety of political states, are all three combined to promote the cause of knowledge and truth.

6. *A Literary and Philosophical Society* of considerable reputation has been lately established at Manchester, under the direction of two presidents, four vice-presidents, and two secretaries. The number of members is limited to 50; besides whom there are several honorary members, all of whom are elected by ballot; and the officers are chosen annually in April. Five volumes of valuable essays have been already published by this society.

A society on a similar plan has been established at Newcastle. It is composed of a number of most respectable members, and possesses a very valuable library and philosophical apparatus. Lectures on the different branches of natural philosophy have been delivered for several years at this institution.

7. *Society for Promoting the Discovery of the Interior Parts*

Parts of Africa. This society or association for exploring the internal districts of Africa, of which so little is at present known, was formed in London by some opulent individuals in 1788; who, strongly impressed with a conviction of the practicability and utility of thus enlarging the fund of human knowledge, determined if possible to rescue the age from that stigma which attaches to its ignorance of so large and so near a portion of the globe. The founders of this society resolved to admit no man a member for a shorter period than three years, during which he must pay annually into the public fund five guineas. After three years, any member, upon giving a year's notice, may withdraw himself from the association. During the first 12 months each of the members was allowed to recommend for the approbation of the society such of his friends as he might think proper to be admitted into it; but since that period we believe all additional members have been elected by a ballot of the association at large. A committee was chosen by ballot to manage the funds of the society, to choose proper persons to be sent on the discovery of the interior parts of Africa, and to carry on the society's correspondence, with express injunctions to disclose no intelligence received from their agents but to the society at large. But a fuller account of the nature of this establishment, and the very happy efforts they have made, may be seen in the superb edition of their proceedings printed in 1790, 4to, for their own use; or in the 8vo edition since made public. They soon found two gentlemen, Mr Lucas and Mr Ledyard, who were singularly well qualified for the important mission. The information they have acquired will be found in the above work; with a new map by Mr Rennel, exhibiting the geographical knowledge collected by the African association. Mr Ledyard very unfortunately died during his researches at Cairo.

Few of our readers are unacquainted with the travels of Mr Park under the patronage of the society. For an account of which see AFRICA. A second journey was undertaken by the same gentleman within these three years; but as he has not been heard of for a long time, the most serious apprehensions are entertained that he and his companions have fallen victims either to the inhospitable climate, or to the watchful jealousy of the Moors. Another enterprising traveller, Mr Horneman, was sent out by the suciety about 1800. He departed from Cairo with a caravan, and reached Mourzouk, a place situated south from Tripoli; and from thence sent a communication to his constituents which has since been published by the society. This is the last account that was received of this traveller, from which it is feared that he has also perished.

8. *The Society of Antiquaries of London*, was founded about the year 1572 by Archbishop Parker, a munificent patron of learned men. For the space of 20 years it assembled in the house of Sir Robert Cotton; in 1589 they resolved to apply to Queen Elizabeth for a charter and a public building where they might hold their meetings; but it is uncertain whether any such application was ever made. In the mean time, the reputation of the society gradually increased, and at length it excited the jealousy of James I. who was afraid lest it should presume to canvass the secret transactions of his government. He accordingly dissolved it. But in the beginning of the last century, the Antiquarian society began to revive; and a number of gentlemen, eminent for their affection to this science, had weekly meetings, in which they examined the antiquities and history of Great Britain preceding the reign of James I. but without excluding any other remarkable antiquities that might be offered to them. From this time the society grew in importance; and in 1750 they unanimously resolved to petition the king for a charter of incorporation. This they obtained the year following, by the influence of the celebrated earl of Hardwicke, then lord-chancellor, and Martin Folkes, Esq; who was then their president. The king declared himself their founder and patron, and empowered them to have a body of statutes, and a common seal, and to hold in perpetuity lands, &c. to the yearly value of 1000l.

The chief object of the inquiries and researches of the society are British antiquities and history; not, however, wholly excluding those of other countries. It must be acknowledged, that the study of antiquity offers to the curious and inquisitive a large field for research and amusement. The inquirer in this branch furnishes the historian with his best materials, while he distinguishes from truth the fictions of a bold invention, and ascertains the credibility of facts; and to the philosopher he presents a fruitful source of ingenious speculation, while he points out to him the way of thinking, and the manners of men, under all the varieties of aspect in which they have appeared.

An antiquarian ought to be a man of solid judgement, possessed of learning and science, that he may not be an enthusiastic admirer of every thing that is ancient merely because it is ancient; but be qualified to distinguish between those researches which are valuable and important, and those which are trifling and useless. It is from the want of these qualifications that some men have contracted such a blind passion for every thing that is ancient, that they have exposed themselves to ridicule, and their study to contempt. But if a regard to utility were always to regulate the pursuits of the antiquarian, the shafts of satire would no longer be levelled at him; but he would be respected as the man who labours to restore or to preserve such ancient productions as are suited to illuminate religion, philosophy, and history, or to improve the arts of life.

We by no means intend to apply these observations to any particular society of antiquarians; but we throw them out, because we know that an assiduous study of antiquity is apt, like the ardent pursuit of money, to lose sight of its original object, and to degenerate into a passion which mistakes the mean for the end, and considers possession without a regard to utility as enjoyment.

An association similar to that of the Antiquarian Society of London was founded in *Edinburgh* in 1780, and received the royal charter in 1783. A volume of the transactions of this society has been published; but with the exception of two or three memoirs, it contains little worthy of notice; and accordingly, it has never attracted the attention of the public.

Besides these literary societies here mentioned, there are a great number more in different parts of Europe, some of which are noticed under the article ACADEMY. Those which are omitted are not omitted on account of any idea of their inferior importance; but either because

Societies for Encouraging and Promoting Arts, Manufactures, &c.

caufe we have had no accefs to authentic information, or becaufe they refemble the focieties already defcribed fo clofely, that we could have given nothing but their names.

III. Societies for Encouraging and Promoting Arts, Manufactures, &c.

1. *London Society for the Encouragement of Arts, Manufactures, and Commerce*, was inftituted in the year 1754 by Lord Folkftone, Lord Romney, Dr Stephen Hales, and a few private gentlemen; but the merit of this inftitution chiefly belonged to Mr William Shipley, an ingenious mechanic; who, though deriving no advantages from learning, by unwearied perfonal attendance found means to engage a few perfons of rank and fortune to meet at Peele's coffeehoufe in Fleet-ftreet, and to adopt a plan for promoting arts and manufactures.

The office-bearers of this fociety are a prefident, 12 vice-prefidents, a fecretary, and regifter. Their proceedings are regulated by a body of rules and orders eftablifhed by the whole fociety, and printed for the ufe of the members. All queftions and debates are determined by the holding up of hands, or by ballot if required; and no matter can be confirmed without the affent of a majority at two meetings. They invite all the world to propofe fubjects for encouragement; and whatever is deemed deferving of attention is referred to the confideration of a committee, which, after due inquiry and deliberation, make their report to the whole fociety, where it is approved, rejected, or altered. A lift is printed and publifhed every year of the matters for which they propofe to give premiums; which premiums are either fums of money, and thofe fometimes very confiderable ones; or the fociety's medal in gold or filver, which they confider as the greateft honour they can beftow. All poffible care is taken to prevent partiality in the diftribution of their premiums, by defiring the claimants names to be concealed, and by appointing committees, (who when they find occafion call to their affiftance the moft fkilful artifts) for the ftrict examination of the real merit of all matters and things brought before them, in confequence of their premiums.

The chief objects of the attention of the Society for the Encouragement of Arts, Manufactures, and Commerce, in the application of their revenues, are ingenuity in the feveral branches of the polite and liberal arts, ufeful difcoveries and improvements in agriculture, manufactures, mechanics, and chemiftry, or the laying open of any fuch to the public; and, in general, all fuch ufeful inventions, difcoveries, or improvements (though not mentioned in the book of premiums) as may appear to have a tendency to the advantage of trade and commerce.

The following are fome of the moft important regulations of this fociety. It is required that the matters for which premiums are offered be delivered in without names, or any intimation to whom they belong; that each particular thing be marked in what manner each claimant thinks fit, fuch claimant fending with it a paper fealed up, having on the outfide a correfponding mark, and on the infide the claimant's name and addrefs; and all candidates are to take notice, that no claim for a premium will be attended to, unlefs the conditions of the advertifement are fully complied with. No papers fhall be opened but fuch as fhall gain premiums, unlefs where it appears to the fociety abfolutely neceffary for the determination of the claim: all the reft fhall be returned unopened, with the matters to which they belong, if inquired after by the marks within two years; after which time, if not demanded, they fhall be publicly burnt unopened at fome meeting of the fociety. All the premiums of this fociety are defigned for that part of Great Britain called England, the dominion of Wales, and the town of Berwick upon Tweed, unlefs exprefsly mentioned to the contrary. No perfon fhall receive any premium, bounty, or encouragement, from the fociety for any matter for which he has obtained or propofes to obtain a patent. No member of this fociety fhall be a candidate for or intitled to receive any premium, bounty, or reward whatever, except the honorary medal of the fociety.

The refpectability of the members who compofe it may be feen by perufing the lift which generally accompanies thetr tranfactions. In the laft volume (vol. xii.) it occupies no lefs than 43 pages. Some idea may be formed of the wealth of this fociety, by obferving that the lift of their premiums fills 96 pages, and amounts to 250 in number. Thefe confift of gold medals worth from 30 to 50, and in a few inftances to 100 guineas; and filver medals valued at 10 guineas.

This fociety is one of the moft important in Great Britain. Much money has been expended by it, and many are the valuable effects of which it has been productive. Among thefe we reckon not only the difcoveries which it has excited, but the inftitution of other focieties on the fame principles to which it has given birth; and we do not hefitate to conclude, that future ages will confider the founding of this fociety as one of the moft remarkable epochs in the hiftory of the arts. We contemplate with pleafure the beneficial effects which muft refult to this nation and to mankind by the diffufion of fuch inftitutions; and rejoice in the hope that the active minds of the people of Great Britain, inftead of being employed as formerly in controverfies about religion, which engender ftrife, or in difcuffions concerning the theory of politics, which lead to the adoption of fchemes inconfiftent with the nature and condition of man, will foon be more generally united into affociations for promoting ufeful knowledge and folid improvement, and for alleviating the diftreffes of their fellow creatures.

1. *Society inftituted at Bath for the Encouragement of Agriculture, Arts, Manufactures, and Commerce.* It was founded in the year 1777 by feveral gentlemen who met at the city of Bath. This fcheme met with a very favourable reception both from the wealthy and learned. The wealthy fubfcribed very liberally, and the learned communicated many important papers. On application to the London and provincial focieties inftituted for the like purpofes, they very politely offered their affiftance. Seven volumes of their tranfactions have already been publifhed, containing very valuable experiments and obfervations, particularly refpecting agriculture, which well deferve the attention of all farmers in the kingdom. We have confulted them with much fatisfaction on feveral occafions, and have frequently referred to them in the courfe of this work; and therefore, with pleafure,

embrace

embrace the present opportunity of repeating our obligations. We owe the same acknowledgments to the Society for the Improvement of Arts, &c. of London.

3. *Society for working Mines*, an association lately formed on the continent of Europe. This institution arose from the accidental meeting of several mineralogists at Skleno near Schemnitz in Hungary, who were collected in order to examine a new method of amalgamation. Struck with the shackles imposed on mineralogy by monopolizers of new and useful processes, they thought no method so effectual to break them, as forming a society, whose common labours should be directed to fix mining on its surest principles; and whose memoirs, spread all over Europe, might offer to every adventurer the result of the researches, of which they are the object. By these means they supposed, that there would be a mass of information collected; the interests of individuals would be lost in the general interest; and the one would materially assist the other. Imposture and quackery would, by the same means, be banished from a science, which must be improved by philosophy and experience; and the society, they supposed, would find, in the confidence which they inspired, the reward and the encouragement of their labours. They design, that the memoirs which they publish shall be short and clear; truth must be their basis, and every idle discussion, every foreign digression, must be banished; politics and finance must be avoided, though the dissertations may seem to lead towards them; and they oblige themselves to oppose the affectation of brilliancies, and the ostentation of empty speculation, when compared with plain, simple, and useful facts.

The object of the society is physical geography; mineralogy founded on chemistry; the management of ore in the different operations which it undergoes; subterraneous geometry; the history of mining; founderies, and the processes for the extraction of metals from the ores, either by fusion or amalgamation, in every instance applied to practice. The end of this institution is to collect, in the most extensive sense, every thing that can assist the operations of the miner, and to communicate it to the different members, that they may employ it for the public good, in their respective countries. Each member must consider himself as bound to send to the society every thing which will contribute to the end of its institution; to point out, with precision, the several facts and observations; to communicate every experiment which occurs, even the unsuccessful ones, if the relation may seem to be advantageous to the public; to communicate to the society their examination of schemes, and their opinions on questions proposed by it; and to pay annually two ducats (about 18s. 6d.) to the direction every Easter. The society, on the other hand, is bound to publish every novelty that shall be communicated to it; to communicate to each member, at the member's expence, the memoirs, designs, models, productions, and every thing connected with the institution; to answer all the necessary demands made, relating in any respect to mining; and to give its opinion on every plan or project communicated through the medium of an honorary member.

The great centre of all intelligence is to be at Zellerfeld in Hartz, Brunswick: but the society is not fixed to any one spot; for every particular state some practical mineralogist is nominated as director. Among these are the names of Baron Born, M. Pallas, M. Charpentier, M. Prebra, and M. Henkel. Their office is to propose the members; to take care that the views of the society are pursued in the different countries where they reside; to answer the requests of the members of their country who are qualified to make them; in case of the death of a director, to choose another; and the majority is to determine where the archives and the strong box is to be placed.

All the eminent mineralogists in Europe are members of this society. It is erected on so liberal and so extensive a plan, that we entertain the highest hopes of its success; and have only to add, that we wish much to see the study of several other sciences pursued in the same manner.

4. *The Society for the Improvement of Naval Architecture*, was founded in 1791. The object of it is to encourage every useful invention and discovery relating to naval architecture as far as shall be in their power, both by honorary and pecuniary rewards. They have in view particularly to improve the theories of floating bodies and of the resistance of fluids; to procure draughts and models of different vessels, together with calculations of their capacity, centre of gravity, tonnage, &c.; to make observations and experiments themselves, and to point out such observations and experiments as appear best calculated to further their designs, and most deserving those premiums which the society can bestow. But though the improvement of naval architecture in all its branches be certainly the principal object of this institution, yet the society do not by any means intend to confine themselves merely to the form and structure of vessels. Every subordinate and collateral pursuit will claim a share of the attention of the society in proportion to its merits; and whatever may have any tendency to render navigation more safe, salutary, and even pleasant, will not be neglected.

This institution owes its existence to the patriotic disposition and extraordinary attention of Mr Sewel a private citizen of London, who (though engaged in a line of business totally opposite to all concerns of this kind) has been led, by mere accident, to take such ocular notice of, and make such observations on, the actual state of naval architecture in this country, as naturally occurred to a man of plain understanding, zealous for the honour and interest of his country, and willing to bestow a portion of that time for the public good, which men of a different description would rather have devoted to their own private advantage. His attention was the more seriously excited, by finding that it was the opinion of some private ship-builders, who, in a debate on the failure of one of our naval engagements, pronounced, that such "would ever be the case while that business (the construction of our ships of war) was not studied as a science, but carried on merely by precedent; that there had not been one improvement in our navy that did not originate with the French, who had naval schools and seminaries for the study of it; and that our ships were not a match for those of that nation either singly or in a fleet, &c. &c."

In a short time the society were enabled to offer very considerable premiums for particular improvements in the construction of our shipping, &c. &c. and also to encourage our philosophers, mathematicians, and mechanics, to make satisfactory experiments, tending to ascertain

certain the laws of resistance of water to solids of different forms, in all varieties of circumstance. On this head the reward is not less than one hundred pounds or a gold medal. Other premiums of 50, 30, and 20 guineas, according to the importance or difficulty of the particular subject or point of investigation, are likewise offered, for different discoveries, inventions, or improvements. The terms of admission into the society are a subscription of two guineas annually, or twenty guineas for life.

5. *Society of Artists of Great Britain*, which consists of directors and fellows, was incorporated by charter in 1765, and empowered to purchase and hold lands, not exceeding 1000l. a-year. The directors of this society, annually elected, are to consist of 24 persons, including the president, vice-president, treasurer, and secretary; and it is required that they be either painters, sculptors, architects, or engravers by profession.

6. *British Society for Extending the Fisheries and Improving the Sea-Coasts of this Kingdom*, was instituted in 1786. The end and design of this society will best appear from their charter, of which we present an abstract.

The preamble states, "the great want of improvement in fisheries, agriculture, and manufactures, in the Highlands and Islands of North Britain; the prevalence of emigration from the want of employment in those parts; the prospect of a new nursery of seamen, by the establishment of fishing towns and villages in that quarter. The act therefore declares, that the persons therein named, and every other person or persons who shall thereafter become proprietors of the joint stock mentioned therein, shall be a distinct and separate body politic and corporate, by the name of *The British Society for Extending the Fisheries and Improving the Sea-coasts of this Kingdom*: That the said society may raise a capital joint stock not exceeding 150,000l. to be applied to purchasing or otherwise acquiring lands and tenements in perpetuity, for the building thereon, and on no other land whatever, free towns, villages, and fishing stations: That the joint stock shall be divided into shares of 50l. each: That no one person shall in his or her name possess more than ten shares, or 500l.: That the society shall not borrow any sum or sums of money whatsoever: That the sums to be advanced for this undertaking, and the profits arising therefrom, shall be divided proportionally to the sum subscribed; and that no person shall be liable for a larger sum than he or she shall have respectively subscribed: That one or two shares shall intitle to one vote and no more, in person or by proxy, at all meetings of proprietors; three or four shares to two votes; five, six, or seven shares, to three votes; eight or nine shares to four votes; and ten shares to five votes and no more: That more persons than one inclining to hold in their joint names one or more shares shall be intitled to vote, by one of such persons, according to the priority of their names, or by proxy: That bodies corporate shall vote by proxy under their seal: That all persons holding proxies shall be proprietors, and that no one person shall hold more than five votes by proxy: That the affairs of the society shall be managed by a governor, deputy governor, and 13 other directors, to be elected annually on the 25th of March, from among the proprietors of the society, holding at least one full share, by signed lists of their names to be transmitted by the proprietors to the secretary of the society: that five proprietors, not being governor, director, or other officer, shall be in like manner annually elected to audit the accounts of the society: That there shall be one general meeting of the proprietors annually on the 25th of March: That occasional general meetings shall be called on the request of nine or more proprietors: That the general meetings of the proprietors shall make all bye-laws and constitutions for the government of the society, and for the good and orderly carrying on of the business of the same: That no transfer shall be made of the stock of the society for three years from the 10th of August 1786: That the cash of the society shall be lodged in the bank of England, bank of Scotland, or the royal bank of Scotland: That no director, proprietor, agent, or officer of the society, shall retain any sum or sums of money in his hands beyond the space of 30 days, on any account whatsoever: That all payments by the society shall be made by drafts on the said banks, under the hands of the governor or deputy-governor, countersigned by the secretary or his deputy, and two or more directors: And that the books in which the accounts of the society shall be kept shall be open to all the proprietors."

The institution of this public-spirited society was in a great measure owing to the exertions of the patriotic John Knox; who, in the course of 23 years, traversed and explored the Highlands of Scotland not fewer than 16 times, and expended several thousand pounds of his own fortune in pursuing his patriotic designs.

7. *British Wool Society*. See *British* WOOL *Society*.

SOCIETY Isles, a cluster of isles, so named by Captain Cook in 1769. They are situated between the latitudes of 16. 10. and 16. 55. south, and between the longitudes of 150. 57. and 152. west. They are eight in number; namely, Otaheite, Huaheine, Ulietea, Otaha, Bolabola, Maurua, Tooboua, and Tabooyamanoo or Saunders's Island. The soil, productions, people, their language, religion, customs, and manners, are so nearly the same as at OTAHEITE, that little need be added here on that subject. Nature has been equally bountiful in uncultivated plenty, and the inhabitants are as luxurious and as indolent. A plantain branch is the emblem of peace, and exchanging names the greatest token of friendship. Their dances are more elegant, their dramatic entertainments have something of plot and consistency, and they exhibit temporary occurrences as the objects of praise or satire; so that the origin of ancient comedy may be already discerned among them. The people of Huaheine are in general stouter and fairer than those of Otaheite, and this island is remarkable for its populousness and fertility. Those of Ulietea, on the contrary, are smaller and blacker, and much less orderly. Captain Cook put on shore a Cape ewe at Bolabola, where a ram had been left by the Spaniards; and also an English boar and sow, with two goats, at Ulietea. If the valuable animals which have been transported thither from Europe should be suffered to multiply, no part of the world will equal these islands in variety and abundance of refreshments for future navigators.

SOCINIANS, in *Church-History*, a sect of Christian heretics, so called from their founder Faustus Socinus (see SOCINUS). They maintain, "That Jesus Christ was a mere man, who had no existence before he was conceived by the Virgin Mary; that the Holy Ghost is

Socinians, Socinus.

no distinct person, but that the Father is truly and properly God. They own, that the name of God is given in the Holy Scriptures to Jesus Christ; but contend, that it is only a deputed title, which, however, invests him with an absolute sovereignty over all created beings, and renders him an object of worship to men and angels. They deny the doctrines of satisfaction and imputed righteousness; and say that Christ only preached the truth to mankind, set before them in himself an example of heroic virtue, and sealed his doctrines with his blood. Original sin and absolute predestination they esteem scholastic chimeras. They likewise maintain the sleep of the soul, which they say becomes insensible at death, and is raised again with the body at the resurrection, when the good shall be established in the possession of eternal felicity, while the wicked shall be consigned to a fire that will not torment them eternally, but for a certain duration in proportion to their demerits."

This sect has long been indignant at being styled *Socinians*. They disclaim every human leader; and professing to be guided solely by the word of God and the deductions of reason, they call themselves *Unitarians*, and affect to consider all other Christians, even their friends the Arians, as *Polytheists*. Modern Unitarianism, as taught by Dr Priestley, is, however, a very different thing from Socinianism, as we find it in the Racovian catechism and other standard works of the sect. This far-famed philosopher has discovered, what escaped the sagacity of all the *fratres poloni*, that Jesus Christ was the son of Joseph as well as Mary; that the evangelists mistook the meaning of Isaiah's prophecy, that "a virgin should conceive and bear a son;" that the applying of this prophecy to the birth of our Saviour, led them to conclude that his conception was miraculous; and that we are not to wonder at this mistake, as the apostles were not always inspired, and were in general inconclusive reasoners. The modesty of the writer in claiming the merit of such discoveries will appear in its proper colours to all our readers: the truth of his doctrine shall be considered in another place. See THEOLOGY.

SOCINUS, LÆLIUS, the first author of the sect of the Socinians, was born at Sienna in Tuscany in 1525. Being designed by his father for the law, he began very early to search for the foundation of that science in the Word of God; and by that study discovered that the Romish religion taught many things contrary to revelation; when, being desirous of penetrating farther into the true sense of the Scriptures, he studied Greek, Hebrew, and even Arabic. In 1547 he left Italy, to go and converse with the Protestants; and spent four years in travelling through France, England, the Netherlands, Germany, and Poland, and at length settled at Zurich. He by this means became acquainted with the most learned men of his time, who testified by their letters the esteem they had for him: but as he discovered to them his doubts, he was greatly suspected of heresy. He, however, conducted himself with such address, that he lived among the capital enemies of his opinions, without receiving the least injury. He met with some disciples, who heard his instructions with respect; these were Italians who left their native country on account of religion, and wandered about in Germany and Poland. He communicated likewise his sentiments to his relations by his writings, which he caused to be conveyed to them at Sienna. He died at Zurich in 1562. Those who were of sentiments opposite to his, and were personally acquainted with him, confess that his outward behaviour was blameless. He wrote a Paraphrase on the first chapter of St John; and other works are ascribed to him.

Socinus.

SOCINUS, *Faustus*, nephew of the preceding, and principal founder of the Socinian sect, was born at Sienna in 1539. The letters which his uncle Lælius wrote to his relations, and which infused into them many seeds of heresy, made an impression upon him; so that, knowing himself not innocent, he fled as well as the rest when the inquisition began to persecute that family. He was at Lyons when he heard of his uncle's death, and departed immediately to take possession of his writings. He returned to Tuscany; and made himself so agreeable to the grand duke, that the charms which he found in that court, and the honourable posts he filled there, hindered him for twelve years from remembering that he had been considered as the person who was to put the last hand to the system of samosatenian divinity, of which his uncle Lælius had made a rough draught. At last he went into Germany in 1574, and paid no regard to the grand duke's advices to return. He staid three years at Basil, and studied divinity there, and having adopted a set of principles very different from the system of Protestants, he resolved to maintain and propagate them; for which purpose he wrote a treatise *De Iesu Christo Servatore*. In 1579 Socinus retired into Poland, and desired to be admitted into the communion of the Unitarians; but as he differed from them in some points, on which he refused to be silent, he met with a repulse. However, he did not cease to write in defence of their churches against those who attacked them. At length his book against James Paleologus furnished his enemies with a pretence to exasperate the king of Poland against him; but though the mere reading of it was sufficient to refute his accusers, Socinus thought proper to leave Cracow, after having resided there four years. He then lived under the protection of several Polish lords, and married a lady of a good family; but her death, which happened in 1587, so deeply afflicted him as to injure his health; and to complete his sorrow, he was deprived of his patrimony by the death of Francis de Medicis great duke of Florence. The consolation he found in seeing his sentiments at last approved by several ministers, was greatly interrupted in 1598; for he met with a thousand insults at Cracow, and was with great difficulty saved from the hands of the rabble. His house was plundered, and he lost his goods; but this loss was not so uneasy to him as that of some manuscripts, which he extremely regretted. To deliver himself from such dangers, he retired to a village about nine miles distant from Cracow, where he spent the remainder of his days at the house of Abraham Blonski, a Polish gentleman, and died there in 1604. All Faustus Socinus's works are contained in the two first volumes of the *Bibliotheca Fratrum Polonorum*.

SOCMANS, SOKEMANS, or *Socmen (Socmanni)*, are such tenants as hold their lands and tenements by socage tenure. See SOCAGE.

SOCOTORA, an island lying between Asia and Arabia Felix; about 50 miles in length, and 22 in breadth. It is particularly noted for its fine aloes, known by the name of *Socotrine ALOES*. The religion of the natives

natives is a mixture of Mahometanism and Paganism; but they are civil to strangers who call there in their passage to the East Indies. It abounds in fruit and cattle; and they have a king of their own, who is dependent on Arabia.

SOCRATES, the greatest of the ancient philosophers, was born at Alopece, a village near Athens, in the fourth year of the 77th olympiad. His parents were of low rank; his father Sophroniscus being a statuary, and his mother Phænareta a midwife. Sophroniscus brought up his son, contrary to his inclination, in his own manual employment; in which Socrates, though his mind was continually aspiring after higher objects, was not unsuccessful, for whilst he was a young man, he is said to have formed statues of the habited Graces, which were allowed a place in the citadel of Athens. Upon the death of his father he was left in such straitened circumstances as laid him under the necessity of exercising that art to procure the means of subsistence, though he devoted, at the same time, all the leisure which he could command to the study of philosophy. His distress, however, was soon relieved by Crito, a wealthy Athenian; who, remarking his strong propensity to study, and admiring his ingenuous disposition and distinguished abilities, generously took him under his patronage, and intrusted him with the instruction of his children. The opportunities which Socrates by this means enjoyed of attending the public lectures of the most eminent philosophers, so far increased his thirst after wisdom, that he determined to relinquish his occupation, and every prospect of emolument which that might afford, in order to devote himself entirely to his favourite pursuits. Under Anaxagoras and Archelaus he prosecuted the study of nature in the usual manner of the philosophers of the age, and became well acquainted with their doctrines. Prodicus the sophist was his preceptor in eloquence, Evenus in poetry, Theodorus in geometry, and Damo in music. Aspasia, a woman no less celebrated for her intellectual than her personal accomplishments, whose house was frequented by the most celebrated characters, had also some share in the education of Socrates. Under such preceptors it cannot reasonably be doubted but that he became master of every kind of learning which the age in which he lived could afford; and being blessed with very uncommon talents by nature, he appeared in Athens, under the respectable characters of a good citizen and a true philosopher. Being called upon by his country to take arms in the long and severe struggle between Athens and Sparta, he signalized himself at the siege of Potidæa, both by his valour and by the hardiness with which he endured fatigue. During the severity of a Thracian winter, whilst others were clad in furs, he wore only his usual clothing, and walked barefoot upon the ice. In an engagement in which he saw ALCIBIADES falling down wounded, he advanced to defend him, and saved both him and his arms: and though the prize of valour was on this occasion unquestionably due to Socrates, he generously gave his vote that it might be bestowed upon Alcibiades, to encourage his rising merit. He served in other campaigns with distinguished bravery, and had the happiness on one occasion to save the life of Xenophon, by bearing him, when covered with wounds, out of the reach of the enemy.

It was not till Socrates was upwards of 60 years of age that he undertook to serve his country in any civil office, when he was chosen to represent his own district, in the senate of five hundred. In this office, though he at first exposed himself to some degree of ridicule from the want of experience in the forms of business, he soon convinced his colleagues that he was superior to them all in wisdom and integrity. Whilst they, intimidated by the clamours of the populace, passed an unjust sentence of condemnation upon the commanders, who, after the engagement at the Arginusian islands, had been prevented by a storm from paying funeral honours to the dead, Socrates stood forth singly in their defence, and to the last refused to give his suffrage against them, declaring that no force should compel him to act contrary to justice and the laws. Under the subsequent tyranny he never ceased to condemn the oppressive and cruel proceedings of the thirty tyrants; and when his boldness provoked their resentment, so that his life was in hazard, fearing neither treachery nor violence, he still continued to support with undaunted firmness the rights of his fellow citizens.

Having given these proofs of public virtue both in a military and civil capacity, he wished to do still more for his country. Observing with regret how much the opinions of the Athenian youth were misled, and their principles and taste corrupted by philosophers who spent all their time in refined speculations upon nature and the origin of things, and by sophists who taught in their schools the arts of false eloquence and deceitful reasoning; Socrates formed the wise and generous design of instituting a new and more useful method of instruction. He justly conceived the true end of philosophy to be, not to make an ostentatious display of superior learning and ability in subtle disputations or ingenious conjectures, but to free mankind from the dominion of pernicious prejudices; to correct their vices; to inspire them with the love of virtue; and thus conduct them in the path of wisdom to true felicity. He therefore assumed the character of a moral philosopher; and, looking upon the whole city of Athens as his school, and all who were disposed to lend him their attention as his pupils, he seized every occasion of communicating moral wisdom to his fellow citizens. He passed the greater part of his time in public; and the method of instruction of which he chiefly made use was, to propose a series of questions to the person with whom he conversed, in order to lead him to some unforeseen conclusion. He first gained the consent of his respondent to some obvious truths, and then obliged him to admit others from their relation or resemblance to those to which he had already assented. Without making use of any direct argument or persuasion, he chose to lead the person he meant to instruct, to deduce the truths of which he wished to convince him, as a necessary consequence from his own concessions. He commonly conducted these conferences with such address, as to conceal his design till the respondent had advanced too far to recede. On some occasions he made use of ironical language, that vain men might be caught in their own replies, and be obliged to confess their ignorance. He never assumed the air of a morose and rigid preceptor, but communicated useful instruction with all the ease and pleasantry of polite conversation. Though eminently furnished with every kind of learning, he preferred moral to speculative wisdom. Convinced that philosophy

Socrates.

losophy is valuable, not as it furnishes questions for the schools, but as it provides men with a law of life, he censured his predecessors for spending all their time in abstruse researches into nature, and taking no pains to render themselves useful to mankind. His favourite maxim was, Whatever is above us doth not concern us. He estimated the value of knowledge by its utility, and recommended the study of geometry, astronomy, and other sciences, only so far as they admit of a practical application to the purposes of human life. His great object in all his conferences and discourses was, to lead men into an acquaintance with themselves; to convince them of their follies and vices; to inspire them with the love of virtue; and to furnish them with useful moral instructions. Cicero might therefore very justly say of Socrates, that he was the first who called down philosophy from heaven to earth, and introduced her into the public walks and domestic retirements of men, that she might instruct them concerning life and manners.

Through his whole life this good man discovered a mind superior to the attractions of wealth and power. Contrary to the general practice of the preceptors of his time, he instructed his pupils without receiving from them any gratuity. He frequently refused rich presents, which were offered him by Alcibiades and others, though importunately urged to accept them by his wife. The chief men of Athens were his stewards: they sent him in provisions, as they apprehended he wanted them; he took what his present wants required, and returned the rest. Observing the numerous articles of luxury which were exposed to sale in Athens, he exclaimed, "How many things are there which I do not want!" With Socrates, moderation supplied the place of wealth. In his clothing and food, he consulted only the demands of nature. He commonly appeared in a neat but plain cloak, with his feet uncovered. Though his table was only supplied with simple fare, he did not scruple to invite men of superior rank to partake of his meals; and when his wife, upon some such occasion, expressed her dissatisfaction on being no better provided, he desired her to give herself no concern; for if his guests were wise men, they would be contented with whatever they found at his table; if otherwise, they were unworthy of notice. Whilst others, says he, live to eat, wise men eat to live.

Though Socrates was exceedingly unfortunate in his domestic connection, he converted this infelicity into an occasion of exercising his virtues. Xantippe, concerning whose ill humour ancient writers relate many amusing tales, was certainly a woman of a high and unmanageable spirit. But Socrates while he endeavoured to curb the violence of her temper, improved his own. When Alcibiades expressed his surprise that his friend could bear to live in the same house with so perverse and quarrelsome a companion, Socrates replied, that being daily inured to ill humour at home, he was the better prepared to encounter perverseness and injury abroad.

In the midst of domestic vexations and public disorders, Socrates retained such an unruffled serenity, that he was never seen either to leave his own house or to return home with a disturbed countenance. In acquiring this entire dominion over his passions and appetites, he had the greater merit, as it was not effected without a violent struggle against his natural propensities. Zopyrus, an eminent physiognomist, declared, that he discovered in the features of the philosopher evident traces of many vicious inclinations. The friends of Socrates who were present ridiculed the ignorance of this pretender to extraordinary sagacity. But Socrates himself ingenuously acknowledged his penetration, and confessed that he was in his natural disposition prone to vice, but that he had subdued his inclinations by the power of reason and philosophy.

Through the whole of his life Socrates gave himself up to the guidance of unbiassed reason, which is supposed by some to be all that he meant by the genius or *dæmon* from which he professed to receive instruction. But this opinion is inconsistent with the accounts given by his followers of that dæmon, and even with the language in which he spoke of it himself. Plato sometimes calls it his *guardian*, and Apuleius his *god;* and as Xenophon attests that it was the belief of his master that the gods occasionally communicate to men the knowledge of future events, it is by means improbable that Socrates admitted, with the generality of his countrymen, the existence of those intermediate beings called *dæmons*, of one of which he might fancy himself the peculiar care.

It was one of the maxims of Socrates, "That a wise man will worship the gods according to the institutions of the state to which he belongs." Convinced of the weakness of the human understanding, and perceiving that the pride of philosophy had led his predecessors into futile speculations on the nature and origin of things, he judged it most consistent with true wisdom to speak with caution and reverence concerning the divine nature.

The wisdom and the virtues of this great man, whilst they procured him many followers, created him also many enemies. The Sophists*, whose knavery and ignorance he took every opportunity of exposing to public contempt, became inveterate in their enmity against so bold a reformer, and devised an expedient, by which they hoped to check the current of his popularity. They engaged Aristophanes, the first buffoon of the age, to write a comedy, in which Socrates should be the principal character. Aristophanes, pleased with so promising an occasion of displaying his low and malignant wit, undertook the task, and produced the comedy of *The Clouds*, still extant in his works. In this piece, Socrates is introduced hanging in a basket in the air, and thence pouring forth absurdity and profaneness. But the philosopher, showing in a crowded theatre that he was wholly unmoved by this ribaldry, the satire failed of its effect; and when Aristophanes attempted the year following to renew the piece with alterations and additions, the representation was so much discouraged, that he was obliged to discontinue it.

* See *Sophist*.

From this time Socrates continued for many years to pursue without interruption his laudable design of instructing and reforming his fellow-citizens. At length, however, when the inflexible integrity with which he had discharged the duty of a senator, and the firmness with which he had opposed every kind of political corruption and oppression, had greatly increased the number of his enemies, clandestine arts were employed to raise a general prejudice against him. The people were industriously reminded, that Critias, who had been one of the most cruel of the thirty tyrants, and Alcibiades,

who

Socrates. who had insulted religion, by defacing the public statues of Mercury, and performing a mock representation of the Eleusinian mysteries, had in their youth been disciples of Socrates; and the minds of the populace being thus prepared, a direct accusation was preferred against him before the supreme court of judicature. His accusers were Anytus a leather-dresser, who had long entertained a personal enmity against Socrates, for reprehending his avarice, in depriving his sons of the benefits of learning, that they might pursue the gains of trade; Melitus, a young rhetorician, who was capable of undertaking any thing for the sake of gain; and Lycon, who was glad of any opportunity of displaying his talents. The accusation, which was delivered to the senate under the name of Melitus, was this: "Melitus, son of Melitus, of the tribe of Pythos, accuseth Socrates, son of Sophroniscus, of the tribe of Alopece. Socrates violates the laws, in not acknowledging the gods which the state acknowledges, and by introducing new divinities. He also violates the laws by corrupting the youth. Be his punishment DEATH."

This charge was delivered upon oath to the senate; and Crito a friend of Socrates became surety for his appearance on the day of trial. Anytus soon afterwards sent a private message to Socrates, assuring him that if he would desist from censuring his conduct, he would withdraw his accusation. But Socrates refused to comply with so degrading a condition; and with his usual spirit replied, "Whilst I live I will never disguise the truth, nor speak otherwise than my duty requires." The interval between the accusation and the trial he spent in philosophical conversations with his friends, choosing to discourse upon any other subject rather than his own situation.

When the day of trial arrived, his accusers appeared in the senate, and attempted to support their charge in three distinct speeches, which strongly marked their respective characters. Plato, who was a young man, and a zealous follower of Socrates, then rose up to address the judges in defence of his master; but whilst he was attempting to apologise for his youth, he was abruptly commanded by the court to sit down. Socrates, however needed no advocate. Ascending the chair with all the serenity of conscious innocence, and with all the dignity of superior merit, he delivered, in a firm and manly tone, an unpremeditated defence of himself, which silenced his opponents, and ought to have convinced his judges. After tracing the progress of the conspiracy which had been raised against him to its true source, the jealousy and resentment of men whose ignorance he had exposed, and whose vices he had ridiculed and reproved, he distinctly replied to the several charges brought against him by Melitus. To prove that he had not been guilty of impiety towards the gods of his country, he appealed to his frequent practice of attending the public religious festivals. The crime of introducing new divinities, with which he was charged, chiefly as it seems on the ground of the admonitions which he professed to have received from an invisible power, he disclaimed, by pleading that it was no new thing for men to consult the gods and receive instructions from them. To refute the charge of his having been a corrupter of youth, he urged the example which he had uniformly exhibited of justice, moderation, and temperance; the moral spirit and tendency of his discourses; and the effect which had actually been produced by his doctrine upon the manners of the young. Then, disdaining to solicit the mercy of his judges, he called upon them for that justice which their office and their oath obliged them to administer; and professing his faith and confidence in God, resigned himself to their pleasure. Socrates.

The judges, whose prejudices would not suffer them to pay due attention to this apology, or to examine with impartiality the merits of the cause, immediately declared him guilty of the crimes of which he stood accused. Socrates, in this stage of the trial, had a right to enter his plea against the punishment which the accusers demanded, and instead of the sentence of death, to propose some pecuniary amercement. But he at first peremptorily refused to make any proposal of this kind, imagining that it might be construed into an acknowledgement of guilt; and asserted, that his conduct merited from the state reward rather than punishment. At length, however, he was prevailed upon by his friends to offer upon their credit a fine of thirty *minæ*. The judges, notwithstanding, still remained inexorable: they proceeded, without farther delay, to pronounce sentence upon him; and he was condemned to be put to death by the poison of hemlock.

The sentence being passed, he was sent to prison: which, says Seneca, he entered with the same resolution and firmness with which he had opposed the thirty tyrants; and took away all ignominy from the place, which could not be a prison while he was there. He lay in fetters 30 days; and was constantly visited by Crito, Plato, and other friends, with whom he passed the time in dispute after his usual manner. Anxious to save so valuable a life, they urged him to attempt his escape, or at least to permit them to convey him away; and Crito went so far, as to assure him that, by his interest with the jailor, it might be easily accomplished, and to offer him a retreat in Thessaly; but Socrates rejected the proposal, as a criminal violation of the laws; and asked them, whether there was any place out of Attica which death could not reach.

At length the day arrived when the officers to whose care he was committed delivered to Socrates early in the morning the final order for his execution, and immediately, according to the law, set him at liberty from his bonds. His friends, who came thus early to the prison that they might have an opportunity of conversing with their master through the day, found his wife sitting by him with a child in her arms. Socrates, that the tranquillity of his last moments might not be disturbed by her unavailing lamentations, requested that she might be conducted home. With the most frantic expressions of grief she left the prison. An interesting conversation then passed between Socrates and his friends, which chiefly turned upon the immortality of the soul. In the course of this conversation, he expressed his disapprobation of the practice of suicide, and assured his friends that his chief support in his present situation was an expectation, though not unmixed with doubts, of a happy existence after death. "It would be inexcusable in me (said he) to despise death, if I were not persuaded that it will conduct me into the presence of the gods, who are the most righteous governors, and into the society of just and good men: but I derive confidence from the hope that something of man remains after death, Socrates.

death, and that the condition of good men will then be much better than that of the bad." Crito afterwards asking him, in what manner he wished to be buried? Socrates replied, with a smile, "As you please, provided I do not escape out of your hands." Then, turning to the rest of his friends, he said, "Is it not strange, after all that I have said to convince you that I am going to the society of the happy, that Crito still thinks that this body, which will soon be a lifeless corpse, is Socrates? Let him dispose of my body as he pleases, but let him not at its interment mourn over it as if it were Socrates."

Towards the close of the day he retired into an adjoining apartment to bathe; his friends, in the mean time, expressing to one another their grief at the prospect of losing so excellent a father, and being left to pass the rest of their days in the solitary state of orphans. After a short interval, during which he gave some necessary instructions to his domestics, and took his last leave of his children, the attendant of the prison informed him, that the time for drinking the poison was come. The executioner, though accustomed to such scenes, shed tears as he presented the fatal cup. Socrates received it without change of countenance or the least appearance of perturbation: then offering up a prayer to the gods that they would grant him a prosperous passage into the invisible world, with perfect composure he swallowed the poisonous draught. His friends around him burst into tears. Socrates alone remained unmoved. He upbraided their pusillanimity, and entreated them to exercise a manly constancy worthy of the friends of virtue. He continued walking till the chilling operation of the hemlock obliged him to lie down upon his bed. After remaining for a short time silent, he requested Crito (probably in order to refute a calumny which might prove injurious to his friends after his decease) not to neglect the offering of a cock which he had vowed to Esculapius. Then, covering himself with his cloak, he expired. Such was the fate of the virtuous Socrates! A story, says Cicero, which I never read without tears.

The friends and disciples of this illustrious teacher of wisdom were deeply afflicted by his death, and attended his funeral with every expression of grief. Apprehensive, however, for their own safety, they soon afterwards privately withdrew from the city, and took up their residence in distant places. Several of them visited the philosopher Euclid of Megara, by whom they were kindly received. No sooner was the unjust condemnation of Socrates known through Greece, than a general indignation was kindled in the minds of good men, who universally regretted that so distinguished an advocate for virtue should have fallen a sacrifice to jealousy and envy. The Athenians themselves, so remarkable for their caprice, who never knew the value of their great men till after their death, soon became sensible of the folly as well as criminality of putting to death the man who had been the chief ornament of their city and of the age, and turned their indignation against his accusers. Melitus was condemned to death; and Anytus, to escape a similar fate, went into voluntary exile. To give a farther proof of the sincerity of their regret, the Athenians for a while interrupted public business; decreed a general mourning; recalled the exiled friends of Socrates; and erected a statue to his memory in one of the most frequented parts of the city. His death happened in the first year of the 96th olympiad, and in the 70th year of his age.

Socrates, Soda.

Socrates left behind him nothing in writing; but his illustrious pupils Xenophon and Plato have in some measure supplied this defect. The Memoirs of Socrates, written by Xenophon, afford, however, a much more accurate idea of the opinions of Socrates, and of his manner of teaching, than the Dialogues of Plato, who everywhere mixes his own conceptions and diction with the ideas and language of his master. It is related, that when Socrates heard Plato recite his Lysis, he said, "How much does this young man make me say which I never conceived!"

His distinguishing character was that of a moral philosopher; and his doctrine concerning God and religion was rather practical than speculative. But he did not neglect to build the structure of religious faith upon the firm foundation of an appeal to natural appearances: He taught, that the Supreme Being, though invisible, is clearly seen in his works: which at once demonstrate his existence and his wise and benevolent providence. He admitted, besides the one Supreme Deity, the existence of beings who possess a middle station between God and man, to whose immediate agency he ascribed the ordinary phenomena of nature, and whom he supposed to be particularly concerned in the management of human affairs. Hence he declared it to be the duty of every one, in the performance of religious rites, to follow the customs of his country. At the same time, he taught, that the merit of all religious offerings depends upon the character of the worshipper, and that the gods take pleasure in the sacrifices of none but the truly pious.

Concerning the human soul, the opinion of Socrates, according to Xenophon, was, that it is allied to the Divine Being, not by a participation of essence, but by a similarity of nature; that man excels all other animals in the faculty of reason; and that the existence of good men will be continued after death in a state in which they will receive the reward of their virtue. Although it appears that on this latter topic he was not wholly free from uncertainty, the consolation which he professed to derive from this source in the immediate prospect of death, leaves little room to doubt that he entertained a real expectation of immortality: and there is reason to believe that he was the only philosopher of ancient Greece whose principles admitted of such an expectation (see METAPHYSICS, Part III Chap. iv.). Of his moral system, which was in a high degree pure, and founded on the surest basis, the reader will find a short view in our article MORAL PHILOSOPHY, N° 4.

SOCRATES was also the name of an ecclesiastical historian of the 5th century, born at Constantinople in the beginning of the reign of Theodosius: he professed the law and pleaded at the bar, whence he obtained the name of *Scholasticus*. He wrote an ecclesiastical history from the year 309, where Eusebius ended, down to 440; and wrote with great exactness and judgement. An edition of Eusebius and Socrates, in Greek and Latin, with notes by Reading, was published at London in 1720.

SODA, the name given by the French chemists to the mineral alkali, which is found native in many parts of the world: it is obtained also from common salt, and from

from the afhes of the *kali*, a fpecies of falfola. See CHEMISTRY *Index*, for an account of its properties and combinations: but long after that article was written, foda and potafh were decompofed by means of galvanifm; and the alkalies, hitherto confidered as fimple fubftances, appear, from the experiments of Mr Davy, who firft made the difcovery, to be compounds of oxygen and a metallic bafe. Mr Davy's conclufions have been controverted by fome of the French chemifts; and as the fubject may perhaps in a few months receive fome farther elucidation, we fhall delay our account of the whole till we come to defcribe the apparatus by which the experiments are conducted. See *TROUGH*, *Galvanic*.

SODA is alfo a name for a heat in the ftomach, or heart-burn. See MEDICINE, N° 275.

SODOM, formerly a town of Paleftine in Afia, famous in Scripture for the wickednefs of its inhabitants, and their deftruction by fire from heaven on account of that wickednefs. The place where it ftood is now covered by the waters of the Dead fea, or the lake Afphaltites. See ASPHALTITES.

SODOMY, an unnatural crime, fo called from the city of Sodom, which was deftroyed by fire for the fame. The Levitical law adjudged thofe guilty of this execrable crime to death; and the civil law affigns the fame punifhment to it. The law of England makes it felony. There is no ftatute in Scotland againft Sodomy; the libel of the crime is therefore founded on the divine law, and practice makes its punifhment to be burned alive.

SODOR, a name always conjoined with Man, in mentioning the bifhop of Man's diocefe. Concerning the origin and application of this word, very different opinions have been formed by the learned. Buchanan (lib. i. cap. 34.) fays, that before his time the name of *Sodor* was given to a town in the ifle of Man. In Gough's edition of Camden's *Britannia* (vol. iii. p. 701.) it is faid, that after the ifle of Man was annexed to the crown of England, this appellation was given to a fmall ifland within mufket-fhot of Man, in which the cathedral ftands, called by the Norwegians the *Holm*, and by the inhabitants the *Peel*. In fupport of this opinion a charter is quoted A. D. 1505, in which Thomas earl of Derby and lord of Man confirms to Huan Hefketh bifhop of Sodor all the lands, &c. anciently belonging to the bifhops of Man. " Ecclefiam cathedralem fancti Germani in *Holm Sodor vel Pele* vocatam, ecclefiam fancti Patricii ibidem, et locum præfatum in quo ecclefiæ præfatæ fitæ funt." The truth of either, or perhaps of both, thefe accounts might be allowed; but neither of them is fufficient to account for the conftant conjunction of Sodor and Man, in charters, regifters, and hiftories. If Sodor was a fmall town or ifland belonging to Man, it cannot be conceived why it is always mentioned before it, or rather why it fhould be mentioned at all in fpeaking of a bifhop's diocefe. To fpeak of the bifhopric of Sodor and Man in this cafe would be as improper as it would be to call the bifhopric of Durham the bifhopric of Holy Ifland and Durham, or the bifhopric of Darlington and Durham; the former being a fmall ifland and the latter a town belonging to the county and diocefe of Durham. Neither of thefe accounts, therefore, gives a fatisfactory account of the original conjunction of Sodor and Man.

The ifland of Iona was the place where the bifhop of the Ifles refided, the cathedral church of which, it is faid, was dedicated to our Saviour, in Greek *Soter*, hence *Sotorenfes*, which might be corrupted into *Sodorenfes*, a name frequently given by Danifh writers to the weftern ifles of Scotland. That we may be the more difpofed to accede to this Grecian etymology, the advocates for this opinion tell us, that the name *Icolumkill*, which is often applied to this ifland, is alfo of Greek extraction, being derived from *Columba*, " a pigeon;" a meaning that exactly correfponds to the Celtic word *Colum* and the Hebrew word *Iona*. We muft confefs, however, that we have very little faith in the conjectures of etymologifts, and think that upon no occafion they alone can eftablifh any fact, though when concurring with facts they certainly tend to confirm and explain them. It is only from hiftorical facts that we can know to what Sodor was applied.

It appears from the hiftory of the Orkneys, compiled by an old Icelandic writer, tranflated and enlarged by Torfæus, that the Æbudæ or Weftern ifles of Scotland were divided into two clufters, Nordureys and Sudereys. The Nordureys, which were feparated from the Sudereys by the point of Ardnamurchan, a promontory in Argylefhire, confifted of Muck, Egg, Rum, Canna, Skye, Rafay, Barra, South Uift, North Uift, Benbecula, and Lewis, including Harris, with a great number of fmall ifles. The Sudereys were, Man, Arran, Bute, Cumra, Avon, Gid, Ila, Colonfay, Jura, Scarba, Mull, Iona, Tiree, Coll, Ulva, and other fmall iflands. All thefe, when joined together, and fubject to the fame prince, made up the kingdom of Man and the Ifles. In the Norwegian language, *Suder* and *Norder* fignify fouthern and northern, and *ey* or *ay* an ifland. When the Æbudæ were under one monarch, the feat of empire was fixed in the Sudereys, and the Nordureys were governed by deputies; hence the former are much oftener mentioned in hiftory than the latter; hence, too, the Sudereys often comprehend the Nordureys, as in our days Scotland is fometimes comprehended under England. Sudereys, or Suder, when anglicifed, became Sodor; and all the Weftern ifles of Scotland being included in one diocefe under the Norwegian princes, the bifhop appointed to fuperintend them was called the bifhop of Man and the Ifles, or the bifhop of Sodor and Man. Since Man was conquered by Edward III. it has been feparated from the other ifles, and its bifhops have exercifed no jurifdiction over them. Should it now be afked, why then is the bifhop of Man ftill called the bifhop of Sodor and Man? we reply, that we have been able to difcover no reafon; but fuppofe the appellation to be continued in the fame way, as the title king of France has been kept up by the kings of Great Britain, for feveral centuries after the Englifh were entirely expelled from France.

SOFA, in the eaft, a kind of alcove raifed half a foot above the floor of a chamber or other apartment; and ufed as the place of ftate, where vifitors of diftinction are received. Among the Turks the whole floor of their ftate-rooms is covered with a kind of tapeftry, and on the window-fide is raifed a fofa or fopha, laid with a kind of mattrefs, covered with a carpet much richer than the other. On this carpet the Turks are feated, both men and women, like the tailors in England, crofs-legged, leaning againft the wall, which is bolstered with velvet, satin, or other stuff suitable to the season. Here they eat their meals; only laying a skin over the carpet to serve as a tablecloth, and a round wooden board over all, covered with plates, &c.

SOFALA, or Cefala, a kingdom of Africa, lying on the coast of Mosambique, near Zanguebar. It is bounded on the north by Monomotapa; on the east by the Mosambique sea; on the south by the kingdom of Sabia; and on the west by that of Manica. It contains mines of gold and iron, and a great number of elephants. It is governed by a king, tributary to the Portuguese, who built a fort at the principal town, which is of the same name, and of great importance for their trade to the East Indies. It is seated in a small island, near the mouth of a river. E. Long. 35. 40. S. Lat. 20. 20.

SOFFITA, or Soffit, in *Architecture*, any timber ceiling formed of cross beams of flying corniches, the square compartiments or pannels of which are enriched with sculpture, painting, or gilding; such are those in the palaces of Italy, and in the apartments of Luxembourg at Paris.

Soffita, or *Soffit*, is also used for the underside or face of an architrave; and more particularly for that of the corona or larmier, which the ancients called *lacunar*, the French *plafond*, and we usually the *drip*. It is enriched with compartments of roses; and in the Doric order has 18 drops, disposed in three ranks, six in each, placed to the right of the guttæ, at the bottom of the triglyphs.

SOFI, or Sophi. See Sophi.

SOFTENING, in *Painting*, the mixing and diluting of colours with the brush or pencil.

SOHO, the name of a set of works, or manufactory of a variety of hardwares, belonging to the late Mr Boulton, situated on the borders of Staffordshire, within two miles of Birmingham; now so justly celebrated as to deserve a short historical detail.

About 30 years ago the premises consisted of a small mill and a few obscure dwellings. Mr Boulton, in conjunction with Mr Fothergill, then his partner, at an expence of 9000l. erected a handsome and extensive edifice, with a view of manufacturing metallic toys. The first productions consisted of buttons, buckles, watch-chains, trinkets, and such other articles as were peculiar to Birmingham. Novelty, taste, and variety, were however always conspicuous; and plated wares, known by the name of Sheffield plate, comprising a great variety of useful and ornamental articles, became another permanent subject of manufacture.

To open channels for the consumption of these commodities, all the northern part of Europe was explored by the mercantile partner Mr Fothergill. A wide and extensive correspondence was thus established, the undertaking became well known, and the manufacturer, by becoming his own merchant, eventually enjoyed a double profit.

Impelled by an ardent attachment to the arts, and by the patriotic ambition of forming his favourite Soho into a fruitful seminary of artists, the proprietor extended his views; and men of taste and talents were now sought for, and liberally patronised. A successful imitation of the French *or moulise* ornaments, consisting of vases, tripods, candelabra, &c. &c. extended the celebrity of the works. Services of plate and other works in silver, both massive and airy, were added, and an assay office was established in Birmingham.

Mr Watt, the ingenious improver of the steam-engine, was afterwards taken into partnership with Mr Boulton; and they carried on at Soho a manufactory of steam-engines, not less beneficial to the public than lucrative to themselves. This valuable machine, the nature and excellencies of which are described in another place (see *STEAM-Engine*), Mr Boulton proposed to apply to the operation of coining, and suitable apparatus was erected at a great expence, for the purpose of being employed by government to make a new copper-coinage for the kingdom. Artists of merit were engaged, and specimens of exquisite delicacy were exhibited; the works were also employed upon highly finished medals and private coins. To enumerate all the productions of this manufactory would be tedious (A).

In a national view, Mr Boulton's undertakings are highly valuable and important. By collecting around him artists of various descriptions, rival talents have been called forth, and by successive competition have been multiplied to an extent highly beneficial to the public. The manual arts partook of the benefit, and became proportionably improved.

A barren heath has been covered with plenty and population; and Mr Boulton's works, which in their infancy were little known and attended to, now cover several acres, give employment to more than 600 persons, and are said to be the first of their kind in Europe.

SOIL, the mould covering the surface of the earth, in which vegetables grow. It serves as a support for vegetables, and as a reservoir for receiving and communicating their nourishment.

Soils are commonly double or triple compounds of the several reputed primitive earths, except the barytic. The magnesian likewise sparingly occurs. The more fertile soils afford also a small proportion of coally substance arising from putrefaction, and some traces of marine acid and gypsum. The vulgar division into clay, chalk, sand, and gravel, is well understood. Loam denotes any soil moderately adhesive; and, according to the ingredient that predominates, it receives the epithets of clayey, chalky, sandy, or gravelly. The intimate mixture of clay with the oxydes of iron is called *till*, and is of a hard consistence and a dark reddish colour. Soils are found by analysis to contain their earthy ingredients in very different proportions. According to M. Giobert, fertile mould in the vicinity of Turin, where the fall of rain amounts yearly to 40 inches, affords for each 100 parts, from 77 to 79 of silex, from 8 to 14 of argill, and from 5 to 12 of calx; besides about one-half of carbonic matter, and nearly an equal weight of gas, partly carbonic and partly hydrocarbonic. The same experimenter represents the composition of barren soils in similar situations to be from 42 to 88 per cent. of silex,

(A) It was at this place, in the year 1772, that Mr Eginton invented an expeditious method of copying pictures in oil; but we do not know how far this method has succeeded.

lex, from 20 to 30 of argill, and from 4 to 20 of calx. The celebrated Bergman found rich soils in the valleys of Sweden, where the annual quantity of rain is 24 inches, to contain, for each 100 parts, 56 of filiceous fand, 14 of argill, and 30 of calx. In the climate of Paris, where the average fall of rain is 20 inches, fertile mixtures, according to M. Tillet, vary from 46 to 52 per cent. of filex, and from 11 to 17 of argill, with 37 of calx. Hence it appears that in dry countries rich earths are of a clofer texture, and contain more of the calcareous ingredient, with lefs of the filiceous. Mr Arthur Young has difcovered, that the value of fertile lands is nearly proportioned to the quantities of gas which equal weights of their foil afford by diftillation. See AGRICULTURE *Index*.

SOISSONS, an ancient, large, and confiderable city of France, in the department of Aifne and late province of Soiffonnois. It was the capital of a kingdom of the fame name, under the firft race of the French monarchs. It contains about 12,000 inhabitants, and is a bifhop's fee. The environs are charming, but the ftreets are narrow, and the houfes ill-built. The fine cathedral has one of the moft confiderable chapters in the kingdom; and the bifhop, when the archbifhop of Rheims was abfent, had a right to crown the king. The caftle, though ancient, is not that in which the kings of the firft race refided. Soiffons is feated in a very pleafant and fertile valley, on the river Aifne, 30 miles weft by north of Rheims, and 60 north-eaft of Paris. E. Long. 3. 24. N. Lat. 49. 23.

SOKE, or SOK. See SOCAGE.

SOKEMANS. See SOC and SOCAGE.

SOL, in *Mufic*, the fifth note of the gamut, *ut*, *re*, *mi*, *fa*, *fol*, *la*. See GAMUT.

SOL, or *Sou*, a French coin made up of copper mixed with a little filver, and is worth upwards of an Englifh halfpenny, or the 23d part of an Englifh fhilling. The fol when firft ftruck was equal in value to 12 deniers Tournois, whence it was alfo called *douzain*, a name it ftill retains, though its ancient value be changed; the fol having been fince augmented by three deniers, and ftruck with a puncheon of a fleur-de-lis, to make it current for 15 deniers. Soon after the old fols were coined over again, and both old and new were indifferently made current for 15 deniers. In 1709, the value of the fame fols was raifed to 18 deniers. Towards the latter end of the reign of Louis XIV. the fol of 18 deniers was again lowered to 15; and by the late king it was reduced to the original value of 12. What it is at prefent pofterity may perhaps difcover.

The Dutch have alfo two kinds of fols: the one of filver, called *fols de gros*, and likewife *fchelling*; the other of copper, called alfo the *fluyver*.

SOL, the *Sun*, in *Aftronomy*, *Aftrology*, &c. See ASTRONOMY, *paffim*.

SOL, in *Chemiftry*, is gold; thus called from an opinion that this metal is in a particular manner under the influence of the fun.

SOL, in *Heraldry*, denotes Or, the golden colour in the arms of fovereign princes.

SOLÆUS, or SOLEUS, in *Anatomy*, one of the extenfor mufcles of the foot, rifing from the upper and hinder parts of the tibia and fibula.

SOLAN-GOOSE. See PELICANUS, ORNITHOLOGY *Index*.

SOLANDRA, a genus of plants belonging to the clafs of monadelphia, and to the order of polyandria; and in the natural fyftem arranged under the 38th order, *Tricoccæ*. See BOTANY *Index*.

SOLANUM, a genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 28th order, *Luridæ*. See BOTANY *Index*.

SOLAR, fomething belonging to the SUN.

SOLAR-Spots. See ASTRONOMY *Index*.

SOLDAN. See SULTAN.

SOLDANELLA, a genus of plants belonging to the clafs of pentandria, and order of monogynia; and in the natural fyftem arranged under the 21ft order, *Preciæ*. See BOTANY *Index*.

SOLDER, SODDER, or *Soder*, a metallic or mineral compofition ufed in foldering or joining together other metals.

Solders are made of gold, filver, copper, tin, bifmuth, and lead; ufually obferving, that in the compofition there be fome of the metal that is to be foldered mixed with fome higher and finer metals. Goldfmiths ufually make four kinds of folder, viz. folder of eight, where to feven parts of filver there is one of brafs or copper; folder of fix, where only a fixth part is copper; folder of four, and folder of three. It is the mixture of copper in the folder that makes raifed plate come always cheaper than flat.

As mixtures of gold with a little copper are found to melt with lefs heat than pure gold itfelf, thefe mixtures ferve as folders for gold: two pieces of fine gold are foldered by gold that has a fmall admixture of copper; and gold alloyed with copper is foldered by fuch as is alloyed with more copper: the workmen add a little filver as well as copper, and vary the proportions of the two to one another, fo as to make the colour of the folder correfpond as nearly as may be to that of the piece. A mixture of gold and copper is alfo a folder for fine copper as well as for fine gold. Gold being particularly difpofed to unite with iron, proves an excellent folder for the finer kinds of iron and fteel inftruments.

The folder ufed by plumbers is made of two pounds of lead to one of block-tin. Its goodnefs is tried by melting it, and pouring the bignefs of a crown-piece on a table; for, if good, there will arife little bright fhining ftars therein. The folder for *copper* is made like that of the plumbers; only with copper and tin; and for very nice works, inftead of tin, they fometimes ufe a quantity of filver. Solder for *tin* is made of two-thirds of tin and one of lead, or of equal parts of each; but where the work is any thing delicate, as in organ-pipes, where the juncture is fcarce difcernible, it is made of one part of bifmuth and three parts of pewter. The pewterers ufe a kind of folder made with two parts of tin and one of bifmuth; this compofition melts with the leaft heat of any of the folders.

Silver folder is that which is made of two parts of filver and one of brafs, and ufed in foldering thofe metals. Spelter folder is made of one part of brafs and two of fpelter or zinc, and is ufed by the braziers and copperfmiths for foldering brafs, copper, and iron. This folder is improved by adding to each ounce of it one pennyweight of filver; but as it does not melt without a confiderable degree of heat, it cannot be ufed when it it is inconvenient to heat the work red-hot; in which case copper and brass are soldered with silver.

Though spelter solder be much cheaper than silver-solder, yet workmen in many cases prefer the latter. And Mr Boyle informs us, that he has found it to run with so moderate a heat, as not much to endanger the melting of the delicate parts of the work to be soldered; and if well made, this silver solder will lie even upon the ordinary kind itself; and so fill up those little cavities that may chance to be left in the first operation, which is not easily done without a solder more easily fusible than the first made use of. As to iron, it is sufficient that it be heated to a white heat, and the two extremities, in this state, be hammered together; by which means they become incorporated one with the other.

SOLDERING, the joining and fastening together of two pieces of the same metal, or of two different metals, by the fusion and application of some metallic composition on the extremities of the metals to be joined.

To solder upon silver, brass, or iron: Take silver, five pennyweights; brass, four pennyweights: melt them together for soft solder, which runs soonest. Take silver, five pennyweights; copper, three pennyweights: melt them together for hard solder. Beat the solder thin, and lay it on the place to be soldered, which must be first fitted and bound together with wire as occasion requires; then take borax in powder, and temper it like pap, and lay it upon the solder, letting it dry; then cover it with live coals, and blow, and it will run immediately; take it presently out of the fire, and it is done. It is to be observed, that if any thing is to be soldered in two places, which cannot well be done at one time, you must first solder with the harder solder, and then with the soft; for if it be first done with the soft, it will unsolder again before the other is fastened. Let it be observed, that if you would not have your solder run about the piece that is to be soldered, you must rub such places over with chalk.—In the soldering either of gold, silver, copper, or either of the metals above mentioned, there is generally used borax in powder, and sometimes rosin. As to iron, it is sufficient that it be heated red-hot, and the two extremities thus hammered together, by which means they will become incorporated with each other. For the finer kinds of iron and steel instruments, however, gold proves an excellent solder. This metal will dissolve twice or thrice its weight of iron in a degree of heat very far less than that in which iron itself melts; hence if a small plate of gold is wrapped round the parts to be joined, and afterwards melted by a blow-pipe, it strongly unites the pieces together without any injury to the instrument, however delicate.

SOLDIER, a military man listed to serve a prince or state in consideration of a certain daily pay.

SOLDIER-Crab. See CANCER, ENTOMOLOGY *Index*.

Fresh Water SOLDIER. See STRATIOTES, BOTANY *Index*.

SOLE, in the manege, a sort of horn under a horse's foot, which is much more tender than the other horn that encompasses the foot, and by reason of its hardness is properly called the *horn* or *hoof*.

SOLE. See PLEURONECTES, ICHTHYOLOGY *Index*.

SOLEA. See SANDAL and SHOE.

SOLECISM, in *Grammar*, a false manner of speaking, contrary to the rules of grammar, either in respect of declension, conjugation, or syntax.—The word is Greek, σολοικισμος, derived from the *Soli*, a people of Attica, who being transplanted to Cilicia, lost the purity of their ancient tongue, and became ridiculous to the Athenians for the improprieties into which they fell.

SOLEMN, something performed with much pomp, ceremony, and expence. Thus we say, solemn feasts, solemn funerals, solemn games, &c.—In law, *solemn* signifies something authentic, or what is clothed in all its formalities.

SOLEN, RAZOR-SHEATH, or *Knife-handle Shell;* a genus belonging to the class of *vermes*, and order of *testacea*. See CONCHOLOGY *Index*.

SOLEURE, a canton of Swisserland, which holds the 11th rank in the Helvetic confederacy, into which it was admitted in the year 1481. It stretches partly through the plain, and partly along the chains of the Jura, and contains about 50,000 inhabitants. It is 35 miles in length from north to south, and 35 in breadth from east to west. The soil for the most part is exceedingly fertile in corn; and the districts within the Jura abound in excellent pastures. The trade both of the town and canton is of little value, although they are very commodiously situated for an extensive commerce. It is divided into 11 bailiwicks, the inhabitants of which are all Roman Catholics except those of the bailiwick of Buckegberg, who profess the reformed religion. The sovereign power resides in the great council, which, comprising the senate or little council of 36, consists of 102 members, chosen by the senate in equal proportions from the 11 tribes or companies into which the ancient burghers are distributed; and, owing to the distinction between the ancient and the new burghers (the former consisting of only 85 families) the government was formerly a complete aristocracy.

SOLEURE, an ancient and extremely neat town of Swisserland, capital of the canton of the same name. It contains about 4000 inhabitants, and is pleasantly seated on the Aar, which here expands into a noble river. Among the most remarkable objects of curiosity in this town is the new church of St Urs, which was begun in 1762 and finished in 1772. It is a noble edifice of a whitish grey stone, drawn from the neighbouring quarries, which admits a polish, and is a species of rude marble. The lower part of the building is of the Corinthian, the upper of the Composite order. The façade, which consists of a portico, surmounted by an elegant tower, presents itself finely at the extremity of the principal street. It cost at least 80,000l. a considerable sum for such a small republic, whose revenue scarcely exceeds 12,000l. a-year. Soleure is surrounded by regular stone fortifications, and is 20 miles north-north-east of Bern, 27 south-south-west of Basle, and 45 west of Zurich. E. Long. 7. 20. N. Lat. 47. 15.

SOLFAING, in *Music*, the naming or pronouncing the several notes of a song by the syllables *ut*, *re*, *mi*, *fa*, *sol*, &c. in learning to sing it.

Of the seven notes in the French scale *ut*, *re*, *mi*, *fa*, *sol*, *la*, *si*, only four are used among us in singing, as *mi*, *fa*, *sol*, *la*: their office is principally, in singing, that by applying them to every note of the scale, it may not only be pronounced with more ease, but chiefly that by them the tones and semitones of the natural scale may be better marked out and distinguished. This design is obtained by the four syllables *fa*, *sol*, *la*, *mi*.

Thus from *fa* to *sol* is a tone, also from *sol* to *la*, and from *la* to *mi*, without distinguishing the greater or less tone; but from *la* to *fa*, also from *mi* to *fa*, is only a semitone. If then these be applied in this order, *fa*, *sol*, *la*, *fa*, *sol*, *la*, *mi*, *fa*, &c. they express the natural series from C; and if that be repeated to a second or third octave, we see by them how to express all the different orders of tones and semitones in the diatonic scale; and still above *mi* will stand, *fa*, *sol*, *la*, and below it the same inverted *la*, *sol*, *fa*, and one *mi* is always distant from another an octave; which cannot be said of any of the rest, because after *mi* ascending come always *fa*, *sol*, *la*, which are repeated invertedly descending.

To conceive the use of this, it is to be remembered, that the first thing in learning to sing, is to make one raise a scale of notes by tones and semitones to an octave, and descend again by the same; and then to rise and fall by greater intervals at a leap, as thirds and fourths, &c. and to do all this by beginning at notes of different pitch. Then those notes are represented by lines and spaces, to which these syllables are applied, and the learners taught to name each line and space thereby, which makes what we call *solfaing*; the use whereof is, that while they are learning to tune the degrees and intervals of sound expressed by notes on a line or space, or learning a song to which no words are applied, they may not only do it the better by means of articulate sounds, but chiefly that by knowing the degrees and intervals expressed by those syllables, they may more readily know the places of the semitones, and the true distance of the notes. See the article SINGING.

SOLFATERRA, a mountain of Italy in the kingdom of Naples, and Terra di Lavoro. This mountain appears evidently to have been a volcano in ancient times; and the soil is yet so hot, that the workmen employed there in making alum need nothing else besides the heat of the ground for evaporating their liquids. Of this mountain we have the following account by Sir William Hamilton. "Near Astruni (another mountain, formerly a volcano likewise) rises the Solfaterra, which not only retains its cone and crater, but much of its former heat. In the plain within the crater, smoke issues from many parts, as also from its sides: here, by means of stones and tiles heaped over the crevices, through which the smoke passes, they collect in an aukward manner what they call *sale armoniaco*; and from the sand of the plain they extract sulphur and alum. This spot, well attended to, might certainly produce a good revenue, whereas I doubt if they have hitherto ever cleared 200l. a-year by it. The hollow sound produced by throwing a heavy stone on the plain of the crater of the Solfaterra, seems to indicate that it is supported by a sort of arched natural vault; and one is induced to think that there is a pool of water beneath this vault (which boils by the heat of a subterraneous fire still deeper), by the very moist steam that issues from the cracks in the plain of the Solfaterra, which, like that of boiling water, runs off a sword or knife, presented to it, in great drops. On the outside, and at the foot of the cone of the Solfaterra, towards the lake of Agnano, water rushes out of the rocks so hot as to raise the quicksilver in Fahrenheit's thermometer to the degree of boiling water (A); a fact of which I was myself an eye-witness. This place, well worthy the observation of the curious, has been taken little notice of; it is called the *Pisciarelli*. The common people of Naples have great faith in the efficacy of this water; and make much of it in all cutaneous disorders, as well as for another disorder that prevails here. It seems to be impregnated chiefly with sulphur and alum. When you approach your ear to the rocks of the Pisciarelli, from whence this water ouzes, you hear a horrid boiling noise, which seems to proceed from the huge cauldron that may be supposed to be under the plain of the Solfaterra. On the other side of the Solfaterra, next the sea, there is a rock which has communicated with the sea, till part of it was cut away to make the road to Puzzole; this was undoubtedly a considerable lava, that ran from the Solfaterra when it was an active volcano. Under this rock of lava, which is more than 70 feet high, there is a stratum of pumice and ashes. This ancient lava is about a quarter of a mile broad; you meet with it abruptly before you come in sight of Puzzole, and it finishes as abruptly within about 100 paces of the town. The ancient name of the Solfaterra was *Forum Vulcani*; a strong proof of its origin from subterraneous fire. The degree of heat that the Solfaterra has preserved for so many ages, seems to have calcined the stones upon its cone and in its crater, as they are very white and crumble easily in the hottest parts.

SOLICITOR, a person employed to take care of and manage suits depending in the courts of law or equity. Solicitors are within the statute to be sworn, and admitted by the judges, before they are allowed to practise in our courts, in like manner as attorneys.

There is also a great officer of the law, next to the attorney-general, who is styled the king's solicitor-general; who holds his office by patent during the king's pleasure, has the care and concern of managing the king's affairs, and has fees for pleading, besides other fees arising by patents, &c. He attends on the privy-council; and the attorney-general and he were anciently reckoned among the officers of the exchequer; they have their audience, and come within the bar in all other courts.

SOLID, in *Philosophy*, a body whose parts are so firmly connected together, as not easily to give way or slip from each other; in which sense *solid* stands opposed to *fluid*.

Geometricians define a solid to be the third species of magnitude, or that which has three dimensions, viz. length, breadth, and thickness or depth.

Solids are commonly divided into regular and irregular. The regular solids are those terminated by regular and

(A) "I have remarked, that after a great fall of rain, the degree of heat in this water is much less; which will account for what Padre Torre says (in his book, intitled *Histoire et Phenomenes du Vesuve*), that when he tried it in company with Monsieur de la Condamine, the degree of heat, upon Reaumur's thermometer, was 68°.

and equal planes, and are only five in number, viz. the tetrahedron, which consists of four equal triangles; the cube or hexahedron, of six equal squares; the octahedron, of eight equal triangles; the dodecahedron, of twelve; and the icosihedron, of twenty equal triangles.

The irregular solids are almost infinite, comprehending all such as do not come under the definition of regular solids; as the sphere, cylinder, cone, parallelogram, prism, parallelopiped, &c.

SOLIDS, in *Anatomy*, are the bones, ligaments, membranes, muscles, nerves and vessels, &c.

The solid parts of the body, though equally composed of vessels, are different with regard to their consistence; some being hard and others soft. The hard, as the bones and cartilages, give firmness and attitude to the body, and sustain the other parts: the soft parts, either alone or together with the hard, serve to execute the animal functions. See ANATOMY.

SOLIDAGO, a genus of plants belonging to the class of *syngenesia*, and to the order of *polygamia superflua*; and in the natural system ranging under the 49th order, *Compositæ*. See BOTANY *Index*.

SOLIDITY, that property of matter, or body, by which it excludes all other bodies from the place which itself possesses; and as it would be absurd to suppose that two bodies could possess one and the same place at the same time, it follows, that the softest bodies are equally solid with the hardest. See METAPHYSICS, N° 44. 173, &c.

Among geometricians, the solidity of a body denotes the quantity or space contained in it, and is called also its solid content.

The solidity of a cube, prism, cylinder, or parallelopiped, is had by multiplying its basis into its height. The solidity of a pyramid or cone is had by multiplying either the whole base into a third part of the height, or the whole height into a third part of the base.

SOLILOQUY, a reasoning or discourse which a man holds with himself; or, more properly, according to Papias, it is a discourse by way of answer to a question that a man proposes to himself.

Soliloquies are become very common on the modern stage; yet nothing can be more inartificial, or more unnatural, than an actor's making long speeches to himself, to convey his intentions to the audience. Where such discoveries are necessary to be made, the poets should rather take care to give the dramatic persons such confidants as may necessarily share their inmost thoughts; by which means they will be more naturally conveyed to the audience; yet even this is a shift which an accurate poet would not have occasion for. The following lines of the duke of Buckingham concerning the use and abuse of soliloquies deserve attention:

> Soliloquies had need be very few,
> Extremely short, and spoke in passion too.
> Our lovers talking to themselves, for want
> Of others, make the pit their confidant:
> Nor is the matter mended yet, if thus
> They trust a friend, only to tell it us.

SOLIMAN II. emperor of the Turks, surnamed the *Magnificent*, was the only son of Selim I. whom he succeeded in 1520. He was educated in a manner very different from the Ottoman princes in general; for he was instructed in the maxims of politics and the secrets of government. He began his reign by restoring those persons their possessions whom his father had unjustly plundered. He re-established the authority of the tribunals, which was almost annihilated, and bestowed the government of provinces upon none but persons of wealth and probity: "I would have my viceroys (he used to say) resemble those rivers that fertilize the fields through which they pass, not those torrents which sweep every thing before them."

After concluding a truce with Ismael Sophy of Persia, and subduing Gozeli Bey, who had raised a rebellion in Syria, he turned his arms against Europe. Belgrade was taken in 1521, and Rhodes fell into his hands the year following, after an obstinate and enthusiastic defence. In 1526 he defeated and slew the king of Hungary in the famous battle of Mohatz. Three years after he conquered Buda, and immediately laid siege to Vienna itself. But after continuing 20 days before that city, and assaulting it 20 times, he was obliged to retreat with the loss of 80,000 men. Some time after he was defeated by the Persians, and disappointed in his hopes of taking Malta. He succeeded, however, in dispossessing the Genoese of Chio, an island which had belonged to that republic for more than 200 years.

He died at the age of 76, while he was besieging Sigeth, a town in Hungary, on the 30th August 1566.

He was a prince of the strictest probity, a lover of justice, and vigorous in the execution of it; but he tarnished all his glory by the cruelty of his disposition. After the battle of Mohatz he ordered 1500 prisoners, most of them gentlemen, to be ranged in a circle, and beheaded in presence of his whole army.

Soliman thought nothing impossible which he commanded: A general having received orders to throw a bridge over the Drave, wrote him, that it was impossible. The sultan sent him a long band of linen with these words written on it: "The emperor Soliman, thy master, orders thee to build a bridge over the Drave in spite of the difficulties thou mayest meet with. He informs thee at the same time, that if the bridge be not finished upon his arrival, he will hang thee with the very linen which informs thee of his will."

SOLIPUGA, or SOLIFUGA, in *Natural History*, the name given by the Romans to a small venomous insect of the spider-kind, called by the Greeks *heliocentros*; both words signifying an animal which stings most in the country and seasons where the sun is most hot. Solinus makes this creature peculiar to Sardinia; but this is contrary to all the accounts given us by the ancients. It is common in Africa and some parts of Europe. Almost all the hot countries produce this venomous little creature. It lies under the sand to seize other insects as they go by; and if it meet with any uncovered part of a man, produces a wound which proves very painful; it is said that the bite is absolutely mortal, but probably this is not true. Solinus writes the word *solifuga*, and so do many others, erroneously deriving the name from the notion that this animal flies from the sun's rays, and buries itself in the sand.

SOLIS, ANTONIO DE, an ingenious Spanish writer, of an ancient and illustrious family, born at Placenza an Old Castile, in 1610. He was intended for the law; but his inclination toward poetry prevailed, and he cultivated it with great success. Philip IV. of Spain made him one of his secretaries; and after his death the queen-regent appointed him historiographer of the Indies, a place of great profit and honour: his History of the Conquest of Mexico shows that she could not have named a fitter person. He is better known by this history at least abroad, than by his poetry and dramatic writings, though in these he was also distinguished. He turned priest at 57 years of age, and died in 1686.

SOLITARY, that which is remote from the company or commerce of others of the same species.

SOLITARIES, a denomination of nuns of St Peter of Alcantara, instituted in 1676, the design of which was to imitate the severe penitent life of that saint. Thus they are to keep a continual silence, never to open their mouths to a stranger; to employ their time wholly in spiritual exercises, and leave their temporal concerns to a number of maids, who have a particular superior in a separate part of the monastery: they always go bare-footed, without sandals; gird themselves with a thick cord, and wear no linen.

SOLO, in the Italian music, is frequently used in pieces consisting of several parts, to mark those that are to perform alone; as *flauto solo*, *violino solo*. It is also used for sonatas composed for one violin, one German flute, or other instrument, and a bass; thus we say, *Corelli's solos*, *Geminiani's solos*, &c. When two or three parts play or sing separately from the grand chorus, they are called a *doi soli*, a *tre soli*, &c. Solo is sometimes denoted by *S*.

SOLOMON, the son of David king of Israel, renowned in Scripture for his wisdom, riches, and magnificent temple and other buildings. Towards the end of his life he sullied all his former glory by his apostacy from God; from which cause vengeance was denounced against his house and nation. He died about 975 B. C.

SOLOMON's Seal, a species of CONVALLARIA, which see, BOTANY *Index*.

SOLON, one of the seven wise men of Greece, was born at Salamis, of Athenian parents, who were descended from Codrus. His father leaving little patrimony, he had recourse to merchandise for his subsistence. He had, however, a greater thirst after knowledge and fame than after riches, and made his mercantile voyages subservient to the increase of his intellectual treasures. He very early cultivated the art of poetry, and applied himself to the study of moral and civil wisdom. When the Athenians, tired out with a long and troublesome war with the Megarensians, for the recovery of the isle of Salamis, prohibited any one, under pain of death, to propose the renewal of their claim to that island, Solon thinking the prohibition dishonourable to the state, and finding many of the younger citizens desirous to revive the war, feigned himself mad, and took care to have the report of his insanity spread through the city. In the mean time he composed an elegy adapted to the state of public affairs, which he committed to memory. Every thing being thus prepared, he sallied forth into the market-place with the kind of cap on his head which was commonly worn by sick persons, and, ascending the herald's stand, he delivered, to a numerous crowd, his lamentation for the desertion of Salamis. The verses were heard with general applause; and Pisistratus seconded his advice, and urged the people to renew the war. The decree was immediately repealed; the claim to Salamis was resumed; and the conduct of the war was committed to Solon and Pisistratus, who, by means of a stratagem, defeated the Megarensians, and recovered Salamis.

His popularity was extended through Greece in consequence of a successful alliance which he formed among the states in defence of the temple at Delphos against the Cirrhæans. When dissensions had arisen at Athens between the rich creditors and their poor debtors, Solon was created archon, with the united powers of supreme legislator and magistrate. He soon restored harmony between the rich and poor: He cancelled the debts which had proved the occasion of so much oppression; and ordained that in future no creditor should be allowed to seize the body of the debtor for his security: He made a new distribution of the people, instituted new courts of judicature, and framed a judicious code of laws, which afterwards became the basis of the laws of the twelve tables in Rome. Among his criminal laws are many wise and excellent regulations; but the code is necessarily defective with respect to those principles which must be derived from the knowledge of the true God, and of pure morality, as the certain foundations of national happiness. Two of them in particular were very exceptionable; the permission of a voluntary exile to persons that had been guilty of premeditated murder, and the appointment of a less severe punishment for a rape than for seduction. Those who wish to see accurately stated the comparative excellence of the laws of Moses, of Lycurgus, and Solon, may consult Prize Dissertations relative to Natural and Revealed Religion by Teyler's Theological Society, vol. ix.

The interview which Solon is said to have had with Crœsus king of Lydia, the solid remarks of the sage after surveying the monarch's wealth, the recollection of those remarks by Crœsus when doomed to die, and the noble conduct of Cyrus on that occasion, are known to every schoolboy. Solon died in the island of Cyprus, about the 80th year of his age. Statues were erected to his memory both at Athens and Salamis. His thirst after knowledge continued to the last: "I grow old (said he) learning many things." Among the apophthegms and precepts which have been ascribed to Solon, are the following: Laws are like cobwebs, that entangle the weak, but are broken through by the strong. He who has learned to obey, will know how to command. In all things let reason be your guide. Diligently contemplate excellent things. In every thing that you do, consider the end.

SOLSTICE, in *Astronomy*, that time when the sun is in one of the solstitial points; that is, when he is at his greatest distance from the equator; thus called because he then appears to stand still, and not to change his distance from the equator for some time; an appearance owing to the obliquity of our sphere, and which those living under the equator are strangers to.

The solstices are two in each year; the æstival or summer solstice, and the hyemal or winter solstice. The summer solstice is when the sun seems to describe the tropic of cancer, which is on June 22. when he makes the longest day: the winter solstice is when the sun enters the first degree, or seems to describe the tropic of capricorn, which is on December 22. when he makes the shortest day. This is to be understood as in our northern hemisphere; for in the southern, the sun's entrance

trance into capricorn makes the summer solstice, and that into cancer the winter solstice. The two points of the ecliptic, wherein the sun's greatest ascent above the equator, and his descent below it, are terminated, are called the *solstitial points*; and a circle, supposed to pass through the poles of the world and these points, is called the *solstitial colure*. The summer solstitial point is in the beginning of the first degree of cancer; and is called the *æstival* or *summer point*; and the winter solstitial point is in the beginning of the first degree of capricorn, and is called the *winter point*. These two points are diametrically opposite to each other.

SOLUTION, in *Chemistry*, denotes an intimate union of solid with fluid bodies, so as to form a transparent liquor. See CHEMISTRY *passim*.

SOLVENT, that which dissolves a solid body into a transparent fluid.

SOLWAY MOSS. See *Moving Moss*.

SOMBRERO, the name of an uninhabited island in the West Indies in the form of an hat, whence the name is derived. It is also the name of one of the Nicobar islands in the East Indies.

Wonderful Plant of SOMBRERO, is a strange kind of sensitive plant growing in the East Indies, in sandy bays and in shallow water. It appears like a slender straight stick; but when you attempt to touch it, immediately withdraws itself into the sand. Mr Miller gives an account of it in his description of Sumatra. He says, the Malays call it *lolan lout*, that is, sea grass. He never could observe any tentacula; but, after many unsuccessful attempts, drew out a broken piece about a foot long. It was perfectly straight and uniform, and resembled a worm drawn over a knitting needle. When dry it appears like a coral.

Philosophical Transactions, vol. lxviii. p. 178.

SOMERS, JOHN, lord high chancellor of England, was born at Worcester in 1652. He was educated at Oxford, and afterwards entered himself at the Middle-Temple, where he studied the law with great vigour. In 1688 he was one of the counsel for the seven bishops at their trial, and argued with great learning and eloquence against the dispensing power. In the convention which met by the prince of Orange's summons, January 22. 1689, he represented Worcester; and was one of the managers for the House of Commons, at a conference with the House of Lords upon the word *abdicated*. Soon after the accession of King William and Queen Mary to the throne, he was appointed solicitor-general, and received the honour of knighthood. In 1692 he was made attorney general, and in 1693 advanced to the post of lord keeper of the great seal of England. In 1695 he proposed an expedient to prevent the practice of clipping the coin. In 1697 he was created lord Somers, baron of Evesham, and made lord high chancellor of England. In the beginning of 1700 he was removed from his post of lord chancellor, and the year after was impeached of high crimes and misdemeanors by the House of Commons, of which he was acquitted upon trial by the House of Lords. He then retired to a studious course of life, and was chosen president of the Royal Society. In 1706 he proposed a bill for the regulation of the law; and the same year was one of the principal managers for the union between England and Scotland. In 1708 he was made lord president of the council; from which post he was removed in 1710, upon the change of the ministry. In the latter end of Queen Anne's reign his lordship grew very infirm in his health; which is supposed to be the reason that he held no other post than a seat at the council-table, after the accession of King George I. He died of an apoplectic fit in 1716. Mr Addison has drawn his character very beautifully in the Freeholder.

SOMERSETSHIRE, a county of England, taking its name from Somerton, once the capital, between 50° and 51° 27′ north latitude, and between 1° 25′ and 2° 59′ west longitude. It is bounded on the west by Devonshire, on the south by Dorsetshire, on the north by Bristol channel or the Severn sea, on the north east by a small part of Gloucestershire, and on the east by Wiltshire. It is one of the largest counties in England, extending in length from east to west about 68 miles; in breadth, where broadest, from south to north, about 47; and 240 in circumference. It is divided into 42 hundreds, in which are 3 cities, 32 market-towns, 1700 villages, 385 parishes of which 132 are vicarages, containing more than 1,000,000 of acres, and about 273,750 souls. It sends 18 members to parliament, viz. two for the county, two for Bristol, two for Bath, two for Wells, two for Taunton, two for Bridgewater, two for Ilchester, two for Milbourn-port, and two for Minehead.

The air of this county is very mild and wholesome, especially that of the hilly part. The soil in general is exceeding rich, so that single acres very commonly produce forty or fifty bushels of wheat, and there have been instances of some producing sixty of barley. As there is very fine pasture both for sheep and black cattle, it abounds in both, which are as large as those of Lincolnshire, and their flesh of a finer grain. In consequence of this abundance of black cattle, great quantities of cheese are made in it, of which that of Cheddar is thought equal to Parmesan. In the hilly parts are found coal, lead, copper, and lapis calaminaris. Wood thrives in it as well as in any county of the kingdom. It abounds also in pease, beans, beer, cyder, fruit, wildfowl, and salmon; and its mineral waters are celebrated all over the world.

The riches of this county, both natural and acquired, exceed those of any other in the kingdom, Middlesex and Yorkshire excepted. The woollen manufacture in all its branches is carried on to a very great extent; and in some parts of the county great quantities of linen are made. If to these the produce of various other commodities in which it abounds is added, the amount of the whole must undoubtedly be very great. Its foreign trade must also be allowed to be very extensive, when it is considered that it has a large trade for sea-coal, and possesses, besides other ports, that of Bristol, a town of the greatest trade in England, next to London.

Besides small streams, it is well watered and supplied with fish by the rivers Severn, Avon, Parrel, Froome, Ax, Torre, and Tone. Its greatest hills are Mendip, Pouldon, and Quantock, of which the first abounds in coal, lead, &c. The rivers Severn and Parrel breed very fine salmon. The chief town is Bristol.

SOMERTON, an ancient town in Somersetshire, from whence the county derives its name. It is 123 miles from London; it has five streets, containing 251 houses, which are mostly built of the blue stone from the quarries in the neighbourhood. It is governed by constables, and has a hall for petty sessions. The market

ket for corn is confiderable, and it has feveral fairs for cattle. The church has, what is not very frequent, an *octangular* tower with fix bells. N. Lat. 51. 4. W. Long. 1. 53.

SOMNAMBULI, perfons who walk in their fleep. See SLEEPWALKERS.

SOMNER, WILLIAM, an eminent Englifh antiquary, was born at Canterbury in 1606. His firft treatife was The Antiquities of Canterbury, which he dedicated to Archbifhop Laud. He then applied himfelf to the ftudy of the Saxon language; and having made himfelf mafter of it, he perceived that the old gloffary prefixed to Sir Roger Twifden's edition of the laws of King Henry I. printed in 1644, was faulty in many places; he therefore added to that edition notes and obfervations valuable for their learning, with a very ufeful gloffary. His Treatife of Gavelkind was finifhed about 1648, though not publifhed till 1660. Our author was zealoufly attached to King Charles I. and in 1648 he publifhed a poem on his fufferings and death. His fkill in the Saxon tongue led him to inquire into moft of the European languages ancient and modern. He affifted Dugdale and Dodfworth in compiling the *Monafticon Anglicanum*. His Saxon Dictionary was printed at Oxford in 1659. He died in 1669.

SON, an appellation given to a male child confidered in the relation he bears to his parents. See PARENT and FILIAL *Piety*.

SONATA, in *Mufic*, a piece or compofition, intended to be performed by inftruments only; in which fenfe it ftands oppofed to *cantata*, or a piece defigned for the voice. See CANTATA.

The fonata then, is properly a grand, free, humorous compofition, diverfified with a great variety of motions and expreffions, extraordinary and bold ftrokes, figures, &c. And all this purely according to the fancy of the compofer; who, without confining himfelf to any general rules of counterpoint, or to any fixed number or meafure, gives a loofe to his genius, and runs from one mode, meafure, &c. to another, as he thinks fit. This fpecies of compofition had its rife about the middle of the 17th century; thofe who have moft excelled in it were Baffani and Corelli. We have fonatas of 1, 2, 3, 4, 5, 6, 7, and even 8 parts, but ufually they are performed by a fingle violin, or with two violins, and a thorough bafs for the harpfichord; and frequently a more figured bafs for the bafs viol, &c.

There are a thoufand different fpecies of fonatas; but the Italians ufually reduce them to two kinds. *Suonate de chiefa*, that is, fonatas proper for church mufic, which ufually begin with a grave folemn motion, fuitable to the dignity and fanctity of the place and the fervice, after which they ftrike into a brifker, gayer, and richer manner. Thefe are what they more peculiarly call fonatas. *Suonate de camera*, or fonatas for the chamber, are properly feriefes of feveral little pieces, for dancing, only compofed to the fame tune. They ufually begin with a prelude or little fonata, ferving as an introduction to all the reft: afterwards come the allemand, pavane, courant, and other ferious dances; then jigs, gavots, minuets, chacons, paffecailles, and other gayer airs: the whole compofed in the fame tune or mode

SONCHUS, SOW-THISTLE, in *Botany*, a genus of plants belonging to the clafs of *fyngenefia*, and to the order of *polygamia æqualis*; and in the natural fyftem ranged under the 49th order, *Compofitæ*. The receptacle is naked; the calyx is imbricated, bellying and conical; the down of the feed is fimple, feffile, and very foft; the feed is oval and pointed. There are 13 fpecies; the maritimus, paluftris, fruticofus, arvenfis, oleraceus, tenerrimus, plumieri, alpinus, floridanus, fibiricus, tataricus, tuberofus, and canadenfis. Four of thefe are natives of Britain.—1. *Paluftris*, marfh fow-thiftle. The ftem is erect, from fix to ten feet high, branched and hairy towards the top: the leaves are firm, broad, half pinnated, ferrated, and fharp-pointed; the lower ones fagittate at the bafe: the flowers are of a deep yellow, large, and difperfed on the tops of the branches: the calyx is rough. It is frequent in marfhes, and flowers in July or Auguft.—2. *Arvenfis*, corn fow-thiftle. The leaves are alternate, runcinate, and heart-fhaped at the bafe; the root creeps under ground; the ftem is three or four feet high, and branched at the top. It grows in corn-fields, and flowers in Auguft.—3. *Oleraceus*, common fow-thiftle. The ftalk is fucculent, piftular, and a cubit high or more; the leaves are broad, embracing the ftem, generally deeply finuated, fmooth, or prickly at the edges; the flowers are of a pale yellow, numerous, in a kind of umbel, and terminal; the calyx is fmooth. It is frequent in wafte places and cultivated grounds.—4. *Alpinus*, blue-flowered fow-thiftle. The ftem is erect, purplifh, branched, or fimple, from three to fix feet high: the leaves are large, fmooth, and finuated; the extreme fegment large and triangular: the flowers are blue, and grow on hairy vifcid pedicles, in long fpikes: the calyx is brown. This fpecies is found in Northumberland.

SONG, in *Poetry*, a little compofition, confifting of eafy and natural verfes, fet to a tune in order to be fung. See POETRY, N° 120.

SONG, in *Mufic*, is applied in general to a fingle piece of mufic, whether contrived for the voice or an inftrument. See AIR.

SONG of Birds, is defined by the honourable Daines Barrington to be a fucceffion of three or more different notes, which are continued without interruption, during the fame interval, with a mufical bar of four crotchets in an adagio movement, or whilft a pendulum fwings four feconds.

It is affirmed, that the notes of birds are no more innate than language in man, and that they depend upon imitation, as far as their organs will enable them to imitate the founds which they have frequent opportunities of hearing: and their adhering fo fteadily, even in a wild ftate, to the fame fong, is owing to the neftlings attending only to the inftruction of the parent bird, whilft they difregard the notes of all others that may perhaps be finging round them.

Birds in a wild ftate do not commonly fing above 10 weeks in the year, whereas birds that have plenty of food in a cage fing the greateft part of the year; and we may add, that the female of no fpecies of birds ever fings. This is a wife provifion of nature, becaufe her fong would difcover her neft. In the fame manner, we may rationally account for her inferiority in plumage. The faculty of finging is confined to the cock birds; and accordingly Mr Hunter, in diffecting birds of feveral fpecies, found the mufcles of the larynx to be

Song.

ſtronger in the nightingale than in any other bird of the ſame ſize; and in all thoſe inſtances, where he diſſected both cock and hen, the ſame muſcles were ſtronger in the cock. To the ſame purpoſe, it is an obſervation as ancient as the time of Pliny, that a capon does not crow.

Some have aſcribed the ſinging of the cock-bird in the ſpring ſolely to the motive of pleaſing his mate during incubation; others, who allow that it is partly for this end, believe it is partly owing alſo to another cauſe, viz. the great abundance of plants and inſects in the ſpring, which, as well as ſeeds, are the proper food of ſinging birds at that time of the year.

Mr Barrington remarks, that there is no inſtance of any ſinging bird which exceeds our blackbird in ſize; and this, he ſuppoſes, may ariſe from the difficulty of its concealing itſelf, if it called the attention of its enemies, not only by its bulk, but by the proportionable loudneſs of its notes. This writer farther obſerves, that ſome paſſages of the ſong in a few kinds of birds correſpond with the intervals of our muſical ſcale, of which the cuckoo is a ſtriking and known inſtance; but the greater part of their ſong cannot be reduced to a muſical ſcale; partly, becauſe the rapidity is often ſo great, and it is alſo ſo uncertain when they may ſtop, that we cannot reduce the paſſages to form a muſical bar in any time whatſoever; partly alſo, becauſe the pitch of moſt birds is conſiderably higher than the moſt ſhrill notes of thoſe inſtruments which have the greateſt compaſs; and principally, becauſe the intervals uſed by birds are commonly ſo minute, that we cannot judge of them from the more groſs intervals into which we divide our muſical octave. This writer apprehends, that all birds ſing in the ſame key; and in order to diſcover this key, he informs us, that the following notes have been obſerved in different birds, A, B flat, C, D, F, and G; and therefore E only is wanting to complete the ſcale: now theſe intervals, he ſays, can only be found in the key of F with a ſharp third, or that of G with a flat third; and he ſuppoſes it to be the latter, becauſe admitting that the firſt muſical notes were learned from birds, thoſe of the cuckoo, which have been moſt attended to, form a flat third, and moſt of our compoſitions are in a flat third, where muſic is ſimple, and conſiſts merely of melody. As a farther evidence that birds ſing always in the ſame key, it has been found by attending to a nightingale, as well as a robin which was educated under him, that the notes reducible to our intervals of the octave were always preciſely the ſame.

Moſt people, who have not attended to the notes of birds, ſuppoſe, that every ſpecies ſing exactly the ſame notes and paſſages: but this is by no means true; though it is admitted that there is a general reſemblance. Thus the London bird-catchers prefer the ſong of the Kentiſh goldfinches, and Eſſex chaffinches; and ſome of the nightingale fanciers prefer a Surry bird to thoſe of Middleſex.

Of all ſinging birds, the ſong of the nightingale has been moſt univerſally admired: and its ſuperiority (deduced from a caged bird) conſiſts in the following particulars; its tone is much more mellow than that of any other bird, though at the ſame time, by a proper exertion of its muſical powers, it can be very brilliant. Another point of ſuperiority is its continuance of ſong without a pauſe, which is ſometimes no leſs than 20 ſeconds; and when reſpiration becomes neceſſary, it takes it with as much judgment as an opera-ſinger. The ſky-lark in this particular, as well as in compaſs and variety, is only ſecond to the nightingale. The nightingale alſo ſings (if the expreſſion may be allowed) with ſuperior judgment and taſte. Mr Barrington has obſerved, that his nightingale, which was a very capital bird, began ſoftly like the ancient orators, reſerving its breath to ſwell certain notes, which by theſe means had a moſt aſtoniſhing effect. This writer adds, that the notes of birds, which are annually imported from Aſia, Africa, and America, both ſingly and in concert, are not to be compared to thoſe of European birds.

Song ‖ Soontaburdar.

The following table, formed by Mr Barrington, agreeably to the idea of M. de Piles in eſtimating the merits of painters, is deſigned to exhibit the comparative merit of the Britiſh ſinging birds; in which 20 is ſuppoſed to be the point of abſolute perfection.

SONNA, a book of Mahometan traditions, which the orthodox muſſulmans are required to believe.

SONNERATIA, a genus of plants belonging to the claſs of *icoſandria*, and to the order of *monogynia*. See Botany *Index*.

SONNET, in *Poetry*, a compoſition contained in 14 verſes, viz. two ſtanzas or meaſures of four verſes each, and two of three, the firſt eight verſes being all in three rhimes.

SONNITES, among the Mahometans, an appellation given to the orthodox muſſulmans or true believers; in oppoſition to the ſeveral heretical ſects, particularly the Shiites, or followers of Ali.

SOOJU, or Soy. See Dolichos.

SOONTABURDAR, in the Eaſt Indies; an attendant, who carries a ſilver bludgeon in his hand about two or three feet long, and runs before the palanquin. He is inferior to the chubdar; the propriety of an Indian newaury requiring two ſoontaburdars for every chubdar in the train. The chubdar proclaims the approach of viſitors, &c. He generally carries a large ſilver-ver ftaff about five feet long in his hands; and among the Nabobs he proclaims their praifes aloud as he runs before their palanquins.

SOOT, a volatile matter arifing from wood and other fuel along with the fmoke; or rather, it is the fmoke itfelf condenfed and gathered to the fides of the chimney. Though once volatile, however, foot cannot be again refolved into vapour; but, if diftilled by a ftrong fire, yields a volatile alkali and empyreumatic oil, a confiderable quantity of fixed matter remaining at the bottom of the diftilling veffel. If burnt in an open fire, it flames with a thick fmoke, whence other foot is produced. It is ufed as a material for making fal ammoniac, and as a manure. See AMMONIA, *muriate of*, CHEMISTRY *Index*.

SOOT-Black. See *COLOUR-Making.*

SOPHI, or SOFI, a title given to the emperor of Perfia, importing as much as wife, fage, or philofopher.

The title is by fome faid to have taken its rife from a young fhepherd named *Sophi*, who attained to the crown of Perfia in 1370; others derive it from the *fophoi* or fages anciently called *magi*. Voffius gives a different account of the word: fophi in Arabic, he obferves, fignifies *wool;* and he adds, that it was applied by the Turks out of derifion to the kings of Perfia ever fince Ifhmael's time; becaufe, according to their fcheme of religion, he is to wear no other covering on his head but an ordinary red woollen ftuff; whence the Perfians are alfo called *hezelbafchs*, q. d. *red-heads*. But Bochart affures us, that fophi in the original Perfian language, fignifies one that is pure in his religion, and who prefers the fervice of God in all things: and derives it from an order of religious called by the fame name. The fophis value themfelves on their illuftrious extraction. They are defcended in a right line from Houffein, fecond fon of Ali, Mahomet's coufin, and Fatima, Mahomet's daughter.

SOPHIS, or *Sofees*, a kind of order of religious among the Mahometans in Perfia, anfwering to what are otherwife called *dervifes*, and among the Arabs and Indians *faquirs*. Some will have them called fophis from a kind of coarfe camblet which they wear, called *fouf*, from the city Souf in Syria, where it is principally manufactured. The more eminent of thofe fophis are complimented with the title *fchick*, that is, *reverend*, much as in Romifh countries the religious are called *reverend fathers*. Schick Sophi, who laid the foundation of the grandeur of the royal houfe of Perfia, was the founder, or rather the reftorer of this order: Ifhmael, who conquered Perfia, was himfelf a fophi, and greatly valued himfelf on his being fo. He chofe all the guards of his perfon from among the religious of this order; and would have all the great lords of his court fophis. The king of Perfia is ftill grandmafter of the order; and the lords continue to enter into it, though it be now fallen under fome contempt.

SOPHISM, in *Logic*, a fpecious argument having the appearance of truth, but leading to falfehood. Sophifms are reduced by Ariftotle into eight claffes, an arrangement fo juft and comprehenfive, that it is equally proper in prefent as in former times. 1. *Ignoratio elenchi*, in which the fophift feems to determine the queftion, while he does it only in appearance. Thus the queftion, "Whether the excefs of wine be hurtful?" feems to be determined by proving, that wine revives the fpirits and gives a man courage: but the principal point is here kept out of fight; for ftill it may be hurtful to health, to fortune, and reputation. 2. *Petitio principii*, a begging of the queftion, or taking for granted that which remains to be proved, as if any one fhould undertake to prove that the foul is extended through all the parts of the body, becaufe it refides in every member. This is affirming the fame thing in different words. 3. Reafoning in a circle; as when the Roman Catholics prove the Scriptures to be the word of God by the authority of the church, and the authority of the church from the Scriptures. 4. *Non caufa pro caufa*, or the affigning of a falfe caufe to any effect. Thus the fuppofed principle, that nature abhors a vacuum, was applied to explain the rifing of water in a pump before Galileo difcovered that it was owing to the preffure of the atmofphere. In this way the vulgar afcribe accidents to divine vengeance, and the herefies and infidelity of modern times are faid to be owing to learning. 5. *Fallacia accidentis*, in which the fophift reprefents what is merely accidental as effential to the nature of the fubject. This is nearly allied to the former, and is committed by the Mahometans and Roman Catholics. The Mahometans forbid wine, becaufe it is fometimes the occafion of drunkennefs and quarrels; and the Roman Catholics prohibit the reading of the Bible, becaufe it has fometimes promoted herefies. 6. By deducing an univerfal affertion from what is true only in particular circumftances, and the reverfe: thus fome men argue, "tranfcribers have committed many errors in copying the Scriptures, therefore they are not to be depended on." 7. By afferting any thing in a compound fenfe which is only true in a divided fenfe; fo when the Scriptures affure us, that the worft of finners may be faved, it does not mean that they fhall be faved while they remain finners, but that if they repent they may be faved. 8. By an abufe of the ambiguity of words. Thus Mr Hume reafons in his Effay on Miracles: "Experience is our only guide in reafoning concerning matters of fact; now we know from experience, that the laws of nature are fixed and invariable. On the other hand, teftimony is variable and often falfe; therefore fince our evidence for the reality of miracles refts folely on teftimony which is variable, and our evidence for the uniformity of the laws of nature is invariable, miracles are not to be believed." The fophiftry of this reafoning depends on the ambiguity of the word *experience*, which in the firft propofition fignifies the maxims which we form from our own obfervation and reflection; in the fecond it is confounded with teftimony; for it is by the teftimony of others, as well as our own obfervation, that we learn whether the laws of nature are variable or invariable. The Effay on Miracles may be recommended to thofe who wifh to fee more examples of fophiftry; as we believe moft of the eight fpecies of fophifms which we have mentioned are well illuftrated by examples in that effay.

SOPHIST, an appellation affumed in the early periods of Grecian hiftory by thofe who devoted their time to the ftudy of fcience. This appellation appearing too arrogant to Pythagoras, he declined it, and wifhed to be called a *philofopher;* declaring that, though he could not confider himfelf as a wife man, he was indeed a lover of wifdom. True wifdom and modefty are generally united. The example of Pythagoras was followed by every man of eminence; while the name *sophist* was retained only by those who with a pomp of words made a magnificent display of wisdom upon a very slight foundation of knowledge. Those men taught an artificial structure of language, and a false method of reasoning, by which, in argument, the worse might be made to appear the better reason (see SOPHISM). In Athens they were long held in high repute, and supported, not only by contributions from their pupils, but by a regular salary from the state. They were among the bitterest enemies of the illustrious Socrates, because he embraced every opportunity of exposing to contempt and ridicule their vain pretensions to superior knowledge, and the pernicious influence of their doctrines upon the taste and morals of the Athenian youth.

SOPHISTICATION, the mixing of any thing with what is not genuine; a practice too common in the making up of medicines for sale; as also among vintners, distillers, and others, who are accused of sophisticating their wines, spirits, oils, &c. by mixing with them cheaper and coarser materials; and in many cases the cheat is carried on so artfully as to deceive the best judges.

SOPHOCLES, the celebrated Greek tragic poet, the son of Sophilus an Athenian, was born at Colonn, and educated with great attention. Superior vigour and address in the exercises of the palestra, and skill in music, were the great accomplishments of young men in the states of Greece. In these, Sophocles excelled; nor was he less distinguished by the beauty of his person. He was also instructed in the noblest of all sciences, civil polity and religion: from the first of these he derived an unshaken love of his country, which he served in some embassies, and in high military command with Pericles; from the latter he was impressed with a pious reverence for the gods, manifested by the inviolable integrity of his life. But his studies were early devoted to the tragic muse; the spirit of Eschylus lent a fire to his genius, and excited that noble emulation which led him to contend with, and sometimes to bear away the prize from, his great master. He wrote 43 tragedies, of which 7 only have escaped the ravages of time: and having testified his love of his country by refusing to leave it, though invited by many kings; and having enjoyed the uninterrupted esteem and affection of his fellow-citizens, which neither the gallant actions and sublime genius of Eschylus, nor the tender spirit and philosophic virtue of Euripides, could secure to them, he died in the 91st year of his age, about 406 years before Christ. The burial-place of his ancestors was at Decelia, which the Lacedemonians had at that time seized and fortified; but Lysander, the Spartan chief, permitted the Athenians to inter their deceased poet; and they paid him all the honours due to his love of his country, integrity of life, and high poetic excellence. Eschylus had at once seized the highest post of honour in the field of poetry, the true sublime; to that eminence his claim could not be disputed. Sophocles had a noble elevation of mind, but tempered with so fine a taste, and so chastened a judgement, that he never passed the bounds of propriety. Under his conduct the tragic muse appeared with the chaste dignity of some noble matron at a religious solemnity; harmony is in her voice, and grace in all her motions. From him the theatre received some additional embellishments; and the drama the introduction of a third speaker, which made it more active and interesting: but his distinguished excellence is in the judicious disposition of the fable, and so nice a connection and dependence of the parts on each other, that they all agree to make the event not only probable, but even necessary. This is peculiarly admirable in his "Oedipus King of Thebes;" and in this important point he is far superior to every other dramatic writer.

The ingratitude of the children of Sophocles is well known. They wished to become immediate masters of their father's possessions; and therefore tired of his long life, they accused him before the Areopagus of insanity. The only defence the poet made was to read his tragedy of Oedipus at Colonos, which he had lately finished; and then he asked his judges, whether the author of such a performance could be taxed with insanity! The father upon this was acquitted, and the children returned home covered with shame and confusion. The seven tragedies of Sophocles which still remain, together with the Greek Scholia which accompany them, have been translated into Latin by Johnson, and into English by Dr Franklin and Mr Potter.

SOPHORA, a genus of plants belonging to the class of decandria, and to the order of monogynia; and in the natural system arranged under the 32d order, *Papilionaceæ*. See BOTANY *Index*.

SOPORIFIC, or SOPORIFEROUS, a medicine that produces sleep. Such are opium, laudanum, the seed of poppies, &c. The word is formed from the Latin *sopor* "sleep." The Greeks in place of it use the word *hypnotic*.

SORBONNE, or SORBON, the house or college of the faculty of theology established in the university of Paris. It was founded in 1252 by St Louis, or rather by Robert de Sorbon his confessor and almoner, first canon of Cambray, and afterwards of the church of Paris; who gave his own name to it, which he himself took from the village of Sorbon or Serbon, near Sens, where he was born. The foundation was laid in 1250; Queen Blanche, in the absence of her husband, furnishing him with a house which had formerly been the palace of Julian the apostate, of which some remains are still seen. Afterwards the king gave him all the houses he had in the same place, in exchange for some others. The college has been since magnificently rebuilt by the cardinal de Richelieu. The design of its institution was for the use of poor students in divinity. There are lodgings in it for 36 doctors, who are said to be of the *society of the Sorbonne*; those admitted into it without being doctors, are said to be of the *hospitality of the Sorbonne*. Six regent doctors formerly held lectures every day for an hour and a half each; three in the morning, and three in the afternoon.

SORBONNE, is also used in general for the whole faculty of theology at Paris; as the assemblies of the whole body are held in the house of the Sorbonne; and the bachelors of the other houses of the faculty, as the house of Navarre, &c. come hither to hold their *sorbonnique*, or act for being admitted doctor in divinity.

SORBUS, SERVICE-TREE, a genus of plants belonging to the class of icosandria, and to the order of trigynia. See BOTANY *Index*.—The *aucuparia*, mountain-ash, quicken-tree, quick-beam, or roan-tree, rises with a a ſtraight upright ſtem and regular branching head, twenty or thirty feet high or more, covered with a ſmooth grayiſh brown bark; pinnated leaves of eight or ten pair of long, narrow, ſerrated folioles, and an odd one, ſmooth on both ſides; and large umbellate cluſters of white flowers at the ſides and ends of the branches, ſucceeded by cluſters of fine red berries, ripe in autumn and winter. There is a variety with yellow ſtriped leaves. This ſpecies grows wild in many parts of this iſland in mountainous places, woods, and hedge-rows, often growing to the ſize of timber; and is admitted into moſt ornamental plantations, for the beauty of its growth, foliage, flowers, and fruit; the latter, in particular, being produced in numerous red large bunches all over the tree, exhibit a fine appearance in autumn and winter, till devoured by the birds, eſpecially the blackbird and thruſh, which are ſo allured by this fruit as to flock from all parts and feed on it voraciouſly.—In the iſland of Jura the juice of the berries is employed as an acid for punch. It is probable that this tree was in high eſteem with the Druids; for it is more abundant than any other tree in the neighbourhood of thoſe Druidical circles of ſtones, ſo common in North Britain. It is ſtill believed by ſome perſons, that a branch of this tree can defend them from enchantment or witchcraft. Even the cattle are ſuppoſed to be preſerved by it from danger. The dairy-maid drives them to the ſummer paſtures with a rod of the roan-tree, and drives them home again with the ſame. In Strathſpey, we are told, a hoop is made of the wood of this tree on the 1ſt of May, and all the ſheep and lambs are made to paſs through it.

The *domeſtica*, or cultivated ſervice-tree, with eatable fruit, grows with an upright ſtem, branching 30 or 40 feet high or more, having a browniſh bark, and the young ſhoots in ſummer covered with a mealy down; pinnated leaves of eight or ten pair of broadiſh deeply ſerrated lobes and an odd one, downy underneath; and large umbellate cluſters of white flowers at the ſides and ends of the branches, ſucceeded by bunches of large, fleſhy, edible red fruit, of various ſhapes and ſizes. This tree is a native of the ſouthern warm parts of Europe, where its fruit is uſed at table as a deſert, and it is cultivated here in many of our gardens, both as a fruit-tree and as an ornament to diverſify hardy plantations.

SORCERY, or MAGIC; the power which ſome perſons were formerly ſuppoſed to poſſeſs of commanding the devil and the infernal ſpirits by ſkill in charms and invocations, and of ſoothing them by fumigations. Sorcery is therefore to be diſtinguiſhed from witchcraft; an art which was ſuppoſed to be practiſed, not by commanding evil ſpirits, but by compact with the devil. As an inſtance of the power of bad ſmells over demons or evil ſpirits, we may mention the flight of the evil ſpirit mentioned in Tobit into the remote parts of Egypt, produced, it is ſaid, by the ſmell of the burnt liver of a fiſh. Lilly informs us, that one Evans having raiſed a ſpirit at the requeſt of Lord Bothwell and Sir Kenelm Digby, and forgetting a fumigation, the ſpirit, vexed at the diſappointment, pulled him without the circle, and carried him from his houſe in the Minories into a field near Batterſea Cauſeway.

King James, in his *Dæmonologia*, has given a very full account of the art of ſorcery. "Two principal things (ſays he) cannot well in that errand be wanted: holy water (whereby the devill mockes the papiſts), and ſome preſent of a living thing unto him. There are likewiſe certaine daies and houres that they obſerve in this purpoſe. Theſe things being all ready and prepared, circles are made, triangular, quadrangular, round, double, or ſingle, according to the forme of the apparition they crave. When the conjured ſpirit appeares, which will not be while after many circumſtances, long prayers, and much muttering and murmurings of the conjurors, like a papiſt prieſt diſpatching a hunting maſſe—how ſoone, I ſay, he appeares, if they have miſſed one jote of all their rites; or if any of their feete once ſlyd over the circle, through terror of his fearfull apparition, he paies himſelf at that time, in his owne hand, of that due debt which they ought him, and otherwiſe would have delaied longer to have paied him: I mean, he carries them with him, body and ſoule." How the conjurors made triangular or quadrangular circles, his majeſty has not informed us, nor does he ſeem to imagine there was any difficulty in the matter. We are therefore led to ſuppoſe, that he learned his mathematics from the ſame ſyſtem as Dr Sacheverell, who, in one of his ſpeeches or ſermons, made uſe of the following ſimile: "They concur like parallel lines, meeting in one common centre."

Another mode of conſulting ſpirits was by the beryl, by means of a ſpeculator or ſeer; who, to have a complete ſight, ought to be a pure virgin, a youth who had not known woman, or at leaſt a perſon of irreproachable life and purity of manners. The method of ſuch conſultation is this: The conjuror having repeated the neceſſary charms and adjurations, with the litany or invocation peculiar to the ſpirits or angels he wiſhes to call (for every one has his particular form), the ſeer looks into a cryſtal or beryl, wherein he will ſee the anſwer, repreſented either by types or figures; and ſometimes, though very rarely, will hear the angels or ſpirits ſpeak articulately. Their pronunciation is, as Lilly ſays, like the Iriſh, much in the throat. Lilly deſcribes one of theſe beryls or cryſtals. It was, he ſays, as large as an orange, ſet in ſilver, with a croſs at the top, and round about engraved the names of the angels Raphael, Gabriel, and Uriel. A delineation of another is engraved in the frontiſpiece to Aubery's Miſcellanies.

Theſe ſorcerers or magicians do not always employ their art to do miſchief; but, on the contrary, frequently exert it to cure diſeaſes inflicted by witches; to diſcover thieves; recover ſtolen goods; to foretel future events, and the ſtate of abſent friends. On this account they are frequently called *white witches*. See MAGIC, WITCHCRAFT, &c.

Our forefathers were ſtrong believers when they enacted, by ſtatute 33 Hen. VIII. c. 8. all witchcraft and ſorcery to be felony without benefit of clergy; and again, by ſtatute 1 Jac. I. c. 12. that all perſons invoking any evil ſpirit, or conſulting, covenanting with, entertaining, employing, feeding, or rewarding any evil ſpirit; or taking up dead bodies from their graves to be uſed in any witchcraft, ſorcery, charm, or inchantment; or killing or otherwiſe hurting any perſon by ſuch infernal arts; ſhould be guilty of felony without benefit of clergy, and ſuffer death. And if any perſon ſhould attempt by ſorcery to diſcover hidden treaſure, or to reftore ftolen goods, or to provoke unlawful love, or to hurt any man or beaft, though the fame were not effected, he or fhe fhould fuffer imprifonment and pillory for the firft offence, and death for the fecond. Thefe acts continued in force till lately, to the terror of all ancient females in the kingdom; and many poor wretches were facrificed thereby to the prejudice of their neighbours and their own illufions, not a few having by fome means or other confeffed the fact at the gallows. But all executions for this dubious crime are now at an end; our legiflature having at length followed the wife example of Louis XIV. in France, who thought proper by an edict to reftrain the tribunals of juftice from receiving informations of witchcraft. And accordingly it is with us enacted, by ftatute 9 Geo. II. c. 5. that no profecution fhall for the future be carried on againft any perfon for conjuration, witchcraft, forcery, or inchantment: But the mifdemeanor of perfons pretending to ufe witchcraft, tell fortunes, or difcover ftolen goods, by fkill in the occult fciences, is ftill defervedly punifhed with a year's imprifonment, and ftanding four times in the pillory.

SOREX, the SHREW, a genus of animals belonging to the clafs of *mammalia*, and order of *feræ*. See MAMMALIA *Index*.

SORITES, in *Logic*, a fpecies of reafoning in which a great number of propofitions are fo linked together, that the predicate of the one becomes continually the fubject of the next following, till at laft a conclufion is formed by bringing together the fubject of the firft propofition and the predicate of the laft. Such was that merry argument of Themiftocles, to prove that his little fon under ten years old governed the whole world. Thus: *My fon governs his mother; his mother me; I the Athenians; the Athenians the Greeks; Greece commands Europe; Europe the whole world: therefore my fon commands the whole world.* See LOGIC, N° 96, 97.

SORNING, in *Scots Law*. See LAW, N° clxxxvi. 30.

SORREL, in *Botany*, a fpecies of the RUMEX, which grows in paftures and meadows, and is well known. The natives of Lapland boil large quantities of the leaves in water, and mix the juice when cold with the milk of their rein-deer, which they efteem an agreeable and wholefome food. The Dutch are faid to cultivate this plant for its ufefulnefs in the dyeing of woollen cloths black; and we know that by means of the common broad-leaved forrel an excellent black colour is, in many places of Scotland, given to woollen ftuffs without the aid of copperas. As this mode of dyeing does not in the fmalleft degree injure the texture of the cloth, which continues to the laft foft and filky, without that hardnefs to the touch which it acquires when dyed black by means of copperas, our readers will probably thank us for the following receipt, with which we have been favoured by a learned phyfician:

Let the ftuff to be dyed be well wafhed with foap and water, and afterwards completely dried. Then of the common broad-leaved forrel boil as much as fhall make an acid decoction of fufficient quantity to let the ftuff to be dyed lie in it open and eafy to be ftirred. The greater quantity of forrel that is ufed, the better will the colour be; and therefore if the pot or cauldron will not hold enough at once, when part has been fufficiently boiled, it muft be taken out and wrung, and a frefh quantity be boiled in the fame juice or decoction. When the liquor is made fufficiently acid, ftrain it from the forrel through a fieve, put the cloth or yarn into it, and let it boil for two hours, ftirring it frequently. If ftockings be among the ftuff to be dyed, it will be expedient, after they have been an hour in the boiling liquor, to turn them infide out, and at the end of the fecond hour let the whole be poured into a tub or any other veffel. The pot or cauldron muft then be wafhed, and water put into it, with half a pound of logwood chips for every pound of dry yarn or cloth. The logwood and water fhould boil flowly for four hours; and then the cloth or yarn being wrung from the four liquor, and put into the logwood decoction, the whole muft be fuffered to boil flowly for four hours, ftockings, if there be any, being turned infide out at the end of two hours. Of this laft decoction there muft, as of the former, be enough to let the cloth lie open and eafy to be ftirred while boiling. At the end of the four hours the cloth muft be taken out, and among the boiling liquor, firft removed from the fire, muft be poured a Scotch pint or half an Englifh gallon of ftale urine for every pound of dry cloth or other ftuff to be dyed. When this compound liquor has been ftirred and become cold, the cloth muft be put into it and fuffered to remain well covered for 12 hours, and then dried in the fhade; after which, to diveft it of fmell or any other impurity, it may be wafhed in cold water, and dried for ufe.

Wood-SORREL. See OXALIS, BOTANY *Index*.

SORREL-Colour, in the manege, is a reddifh colour, generally thought to be a fign of a good horfe.

SORRENTO, a fea-port town of the kingdom of Naples, with an archbifhop's fee. It is feated in a peninfula, on the bay of Naples, at the foot of a mountain of the fame name, 17 miles fouth-eaft of Naples. It is the birth-place of Torquato Taffo. E. Long. 14. 24. N. Lat. 40. 36.

SORTILEGE, (*Sortilegium*) a fpecies of divination performed by means of *fortes* or lots.

The *fortes Preneftinæ*, famous in antiquity, confifted in putting a number of letters, or even whole words, into an urn; and then, after fhaking them together, they were thrown on the ground; and whatever fentences could be made out from them, conftituted the anfwer of the oracle. To this method of divination fucceeded that which has been called the *fortes Homerianæ* and *fortes Virgilianæ*, a mode of inquiring into futurity, which undoubtedly took its rife from a general cuftom of the oracular priefts of delivering their anfwers in verfe; it fubfifted a long time among the Greeks and Romans; and being from them adopted by the Chriftians, it was not till after a long fucceffion of centuries that it became exploded. Among the Romans it confifted in opening fome celebrated poet at random, and among the Chriftians the Scriptures, and drawing, from the firft paffage which prefented itfelf to the eye, a prognoftic of what would befal one's felf or others, or direction for conduct when under any exigency. There is good evidence that this was none of the vulgar errors; the greateft perfons, philofophers of the beft repute, admitted this fuperftition. Socrates, when in prifon, hearing this line of Homer,

Within three days I Phthia's fhore fhall fee,

immediately faid, within three days I fhall be out of the world;

world: gathering it from the double meaning of the word *Phthia*, which in Greek is both the name of a country and signifies corruption or death. This prediction, addressed to Æschines, was not easily forgotten, as it was verified.

When this superstition passed from Paganism into Christianity, the Christians had two methods of consulting the divine will from the Scriptures; the one, casually, to open the divine writings, and take their direction, as above mentioned; the other, to go to church with a purpose of receiving, as a declaration of the will of heaven, the words of the Scripture, which were singing at the instant of one's entrance.

This unwarrantable practice of inquiring into futurity prevailed very generally in England till the beginning of the 18th century; and sometimes the books of Scripture, and sometimes the poems of Virgil, were consulted for oracular responses. One remarkable instance is that of King Charles I. who being at Oxford during the civil wars, went one day to see the public library, where he was shown, among other books, a Virgil nobly printed and exquisitely bound. The lord Falkland, to divert the king, would have his majesty make a trial of his fortune by the *Sortes Virgilianæ*. Whereupon the king opening the book, the passage which happened to come up was this:

> *At, bello audacis populi vexatus et armis,*
> *Finibus extorris, complexu avulsus Iuli,*
> *Auxilium imploret; videatque indigna suorum*
> *Funera: nec, cum se sub leges pacis iniquæ*
> *Tradiderat, regno aut optata luce fruatur;*
> *Sed cadat ante diem, mediaque inhumatus arena.*
> Æneid, lib. iv.

> Yet let a race, untamed and haughty foes,
> His peaceful entrance with dire arms oppose;
> Oppressed with numbers in the unequal field,
> His men discouraged, and himself expelled,
> Let him for succour sue from place to place,
> Torn from his subjects, and his son's embrace:
> First let him see his friends in battle slain,
> And their untimely fate lament in vain;
> And when at length the cruel war shall cease,
> On hard conditions may he buy his peace.
> Nor let him then enjoy supreme command,
> But fall untimely by some hostile hand,
> And lie unburied on the barren sand.

Lord Falkland observing that the king was concerned at this accident, would likewise try his own fortune in the same manner, hoping he might fall upon some passage that would have no relation to his case, and thereby divert the king's thoughts from any impression which the other might have upon him; but the place he stumbled upon was as much suited to his destiny as the other had been to the king's; being the lamentation of Evander for the untimely death of his son Pallas*: for this lord's eldest son, a young man of an amiable character, had been slain in the first battle of Newbury.

* Æneid, lib. xi.

We have ourselves known several whose devotion has not always been regulated by judgement pursue this method of divination; and have generally observed, that the consequence has been despair or presumption. To such we beg leave to recommend one passage in Scripture which will never disappoint them: *Thou shalt not tempt the Lord thy God.*

SOTERIA, in antiquity, sacrifices offered to the gods for delivering a person from danger; as also poetical pieces composed for the same purpose.

SOUBISE, a town of France, in the department of Lower Charente, and late territory of Saintonge. It is seated on the river Charente, 22 miles south of Rochelle, in W. Long. 1. 2. N. Lat. 45. 57.

SOUDAN, a kingdom of Africa, situated between 11° and 16° N. Lat. and 26° and 30° E. Long. See DAR FUR.

SOUGH, among miners, denotes a passage dug under ground, to convey off waters from mines. See MINE.

SOVEREIGN, in matters of government, is applied to the supreme magistrate or magistrates of an independent government or state; because their authority is only bounded by the laws of God and the laws of the state: such are kings, princes, &c. See PREROGATIVE, &c.

SOVEREIGN Power, or *Sovereignty*, is the power of making laws; for wherever that power resides, all others must conform to it, and be directed by it, whatever appearance the outward form and administration of the government may put on. For it is at any time in the option of the legislature to alter that form and administration by a new edict or rule, and to put the execution of the laws into whatever hands it pleases: and all the other powers of the state must obey the legislative power in the execution of their several functions, or else the constitution is at an end. In our constitution the law ascribes to the king the attribute of sovereignty: but that is to be understood in a qualified sense, i. e. as supreme magistrate, not as sole legislator; as the legislative power is vested in the king, lords, and commons, not in any of the three estates alone.

SOU. See SOL.

SOUFFRIERE, a small town, situated at the bottom of a bay, near the leeward extremity of the island of St Lucia. Of itself it is not entitled to much notice, but the adjacent ground is very remarkable. The declivities of the surrounding hills are cultivated, and afford sugar-cane of a good quality.

The extremity of the south side of Souffriere bay runs into two steep hills of a conical shape, and nearly perpendicular, reckoned the highest on the island, and known by the appellation of the *Sugar-Loaf Hills*. It is impossible to ascend them; for although it was once attempted by two negroes, it is said that they never returned. Passing the hills to the windward of Souffriere, a fine level country presents itself, extending from 15 to 20 miles from the back of the Sugar-Loaf Hills along the sea coast, being wholly cultivated, and divided into rich estates. It is intersected by numerous rivers of very clear water, which, by art, are made subservient to the purpose of sugar-making. The rains here are less frequent than on any other part of the island, and the wind blows from the sea, or nearly so.

There is a volcano in the vicinity of this town. After passing one or two small hills, the smell of sulphur is sensibly felt before any vestige of the place is perceived. The first thing discerned is a rivulet of black running water, sending forth streams nearly in a state of ebullition, from which the volcano soon comes into view, situated

Soufriere li. Sounding.

tuated in a hollow, and furrounded by hills on every fide. There are many pits in the hollow, of a black and thick boiling matter, which appears to work with great force. Lava is ejected by flow degrees, and there is a large mafs of it in the centre of the hollow, forming a fort of hill. The lava is faid to be a fulphur mixed with calcareous earth and fome faline body. Small quantities of alum have been found in a perfect ftate; and there is a rivulet of good water in the opening, at the north fide of the hollow. When the bottom of it is ftirred, the water is very hot, fo much fo as not to be touched. The liquid running from the pits is ftrongly impregnated with fulphur, and very much refembles the preparation fold in the fhops, called *aqua fulphurata*.

SOUL, the principle of perception, memory, intelligence, and volition, in man; which, fince the earlieft era of philofophy, has furnifhed queftions of difficult inveftigation, and materials of keen and important controverfy (fee METAPHYSICS, Part III. chap. ii. iii. iv. v.; and RESURRECTION, N° 42—48.). In the 4th volume of the Memoirs of the Literary and Philofophical Society of Manchefter, the reader will find a very valuable paper by Dr Ferriar, proving, by evidence apparently complete, that every part of the brain has been injured without affecting the act of thought. An abridgement of that memoir would weaken its reafoning; which, built on matters of fact and experience, appears to us to have fhaken the modern theory of the Materialifts from its very foundation.

SOUL of Brutes. See BRUTES.

SOUND, in *Phyfics*, a term which expreffes a fimple idea; it is that primary information which we obtain of external things by means of the fenfe of hearing. See ACOUSTICS.

SOUND, in *Geography*, denotes in general any ftrait or inlet of the fea between two headlands. It is given by way of eminence to the ftrait between Sweden and Denmark, joining the German ocean to the Baltic. being about three miles over. See DENMARK, N° 32. and ELSINORE.

SOUND-Board, the principal part of an organ, and that which makes the whole machine play. It is a refervoir into which the wind, drawn in by the bellows, is conducted by a port-vent, and thence diftributed into the pipes placed over the holes of its upper part. The wind enters them by valves, which open by preffing on the keys, after the regifters are drawn, by which the air is prevented from going into any of the other pipes, befides thofe in which it is required.

SOUND-Board alfo denotes a thin broad board placed over the head of a public fpeaker, to enlarge or extend and ftrengthen his voice.

Sound-boards are found by experience to be of no ufe in theatres, as their diftance from the fpeaker is too great to be impreffed with fufficient force. But foundboards over a pulpit have frequently a good effect, when the cafe is conftructed of a proper thicknefs, and according to particular principles.

SOUND-Poft, is a poft placed in the infide of a violin, &c. as a prop between the back and belly of the inftrument, and nearly under the bridge.

SOUNDING, the operation of trying the depth of the fea, and the nature of the bottom, by means of a plummet funk from a fhip to the bottom.

There are two plummets ufed for this purpofe in navigation; one of which is called the *hand-lead*, weighing about 8 or 9 pounds; and the other the *deep fea-lead*, which weighs from 25 to 30 pounds; and both are fhaped like the fruftum of a cone or pyramid. The former is ufed in fhallow waters, and the latter at a great diftance from the fhore; particularly on approaching the land after a fea-voyage. Accordingly the lines employed for this purpofe are called the *deep-fea lead-line*, and the *hand lead-line*.

The hand lead-line, which is ufually 20 fathoms in length, is marked at every two or three fathoms; fo that the depth of the water may be afcertained either in the day or night. At the depth of two and three fathoms, there are marks of black leather; at 5 fathoms, there is a white rag; at 7, a red rag; at 10, black leather; at 13, black leather; at 15, a white rag; and at 17, a red ditto.

Sounding with the hand lead, which is called *heaving the lead* by feamen, is generally performed by a man who ftands in the main-chains to windward. Having the line quite ready to run out without interruption, he holds it nearly at the diftance of a fathom from the plummet; and having fwung the latter backwards and forwards three or four times, in order to acquire the greater velocity, he fwings it round his head, and thence as far forward as is neceffary; fo that, by the lead's finking whilft the fhip advances, the line may be almoft perpendicular when it reaches the bottom. The perfon founding then proclaims the depth of the water in a kind of fong refembling the cries of hawkers in a city. Thus if the mark of five fathoms is clofe to the furface of the water, he calls, 'By the mark five!" and as there is no mark at four, fix, eight, &c. he eftimates thofe numbers, and calls, 'By the dip four,' &c. If he judges it to be a quarter or an half more than any particular number, he calls, 'And a quarter five! and a half four,' &c. If he conceives the depth to be three quarters more than a particular number, he calls it a quarter lefs than the next: thus, at four fathoms and three fourths he calls 'A quarter lefs five!' and fo on.

The deep fea lead is marked with two knots at 20 fathoms, three at 30, four at 40, and fo on to the end. It is alfo marked with a fingle knot in the middle of each interval, as at 25, 35, 45 fathoms, &c. To ufe this lead more effectually at fea, or in deep water on the fea coaft, it is ufual previoufly to bring to the fhip, in order to retard her courfe: the lead is then thrown as far as poffible from the fhip on the line of her drift, fo that, as it finks, the fhip drives more perpendicularly over it. The pilot, feeling the lead ftrike the bottom, readily difcovers the depth of the water by the mark on the line neareft its furface. The bottom of the lead being alfo well rubbed over with tallow, retains the diftinguifhing marks of the bottom, as fhells, ooze, gravel, &c. which naturally adhere to it.

The depth of the water, and the nature of the ground, which is called the *foundings*, are carefully marked in the log-book, as well to determine the diftance of the place from the fhore, as to correct the obfervations of former pilots.

A machine for the fame purpofe has been invented by Mr Maffey, of which the following defcription is given:

"The importance of obtaining true foundings at fea muft be be admitted by every feaman ; and it is rather fingular, that no other method than the common lead has hitherto been brought into ufe ; as its imperfections are very generally acknowledged.

" Many veffels have been loft, by depending upon the foundings taken in the ufual way. The difficulty of obtaining the true perpendicular, and the uncertainty as to the exact moment when the lead ftrikes the bottom, upon which the accuracy of the refult depends, muft always prevent the poffibility of obtaining the true depth, while the fhip has any confiderable way upon her. Indeed, it has been acknowledged by experienced feamen, during fome experiments, made at various times, in the river Merfey, that they could not depend upon the common lead, when going five or fix knots in the hour, in ten or twelve fathoms of water. When the depth is confiderable, the veffel muft be hove to, which is an operation attended with great lofs of time, and fometimes confiderable injury to the fails ; and during a chafe, this inconvenience muft be particularly felt.

" True foundings may be taken with this machine in thirty fathoms water, without the trouble of heaving the veffel to, although fhe may be going at the rate of fix miles in the hour. True foundings may alfo thus be obtained in very deep water, where it is not poffible to take them by the common lead.

Plate ccccxcvii. Fig. 1.

" Fig. 1. reprefents the founding machine. *a* is the founding weight, containing a regifter, 1, 2, with two dials : the hand of the dial 1 makes one revolution when the weight has defcended twenty fathoms, the other revolves once when the defcent amounts to five hundred fathoms. A rotator, *b*, fimilar to that attached to the log, communicates with the wheel work of the dials 1, 2, by means of the rod *c*, on which there are three univerfal joints, 3, 4, and 5. This rod is fupported during the defcent of the weight, by the drop, *d*, at the end of which is a fork, 6, and a friction wheel, 7.

" When the machine is to be ufed, a founding line is faftened to the ring, *e* ; and one of the vanes of the rotator is flipped into the fpring 8 : the rotator will then be in the pofition indicated by the dotted lines, *x*. The indices muft be fet at 0, and the cover or lid, *f*, be fhut. The machine muft then be projected perpendicularly into the fea. As foon as it reaches the furface, the refiftance of the water forces the dotted rotator, *x*, out of the fpring 8, and it affumes its perpendicular direction as reprefented by the rotator *b*. As the machine defcends, it is evident the rotator will revolve, and its motion be communicated freely paft the friction wheel 7, and the univerfal joint 5, to the wheel work of the dials 1, 2, and thus indicate the fpace paffed through in fathoms. When the machine has arrived at the bottom, the rotator, as it is no longer buoyed up by the reaction of the water, will fall to the bottom, quitting the fork of the drop *d*, which will alfo fall from its horizontal pofition, and in its defcent, by means of the locking rod 9, prevent the rotator from revolving as the machine is drawn up. When at the bottom, the rotator will be in the pofition of the dotted lines *y*.

" This machine, fimple in its conftruction, and fcarcely more liable to accident than the common lead, afcertains, with the utmoft precifion, the perpendicular depth, by the mere act of defcent through the water. No miftake can arife from that common fource of errour, the drift or lee-way of the fhip during the time of defcent ; nor does an operation of fuch importance depend upon the uncertain fenfation caufed by the lead ftriking the bottom, on which the accuracy of the common log altogether depends, and which, it is well known, frequently and materially mifleads the beft feaman : for though a thoufand fathoms of line were paid out, in the fmalleft depth of water, no inaccuracy could arife, as the perpendicular depth, at the point of heaving, would be regiftered on the index. The only inconvenience experienced would be the additional labour neceffary for hauling in the excefs of line. The moft inexperienced perfon may ufe this machine, without rifk of error, in the moft turbulent fea, and during the night.

" The advantages already enumerated would render the founding machine of great importance ; but there are other properties of ftill more confequence.

" To heave a fhip to, in order to obtain foundings, on a lee fhore, in ftormy weather, is a very difagreeable operation, attended with much trouble, and lofs of way ; alfo with confiderable danger to the fhip's fails ; indeed, it would often, under fuch circumftances, be attended with great hazard to the fafety of the fhip. To avoid thefe unpleafant confequences, the mafter fometimes adopts a meafure, which he conceives to be the lefs exceptionable alternative, by running on without founding at all.

" To prove how much inconvenience and danger are avoided by Maffey's lead, it is enough to ftate, that foundings may be taken in depth from 60 to 80 fathoms, while the fhip is under way, at the rate of three miles an hour ; and as the rate of failing may be ftill materially reduced, without entirely ftopping the veffel, or altering her courfe, fo may foundings be had, to any depth required, while fhe is under way.

" In order more clearly to fhow the fuperiority of this machine, and make it apparent, that the quantity of ftray-line veered out does not at all affect the truth of the refult : fuppofe the common lead thrown from the mizen chains of the fhip, which may be reprefented by the point *a* of the triangle *a b c*, (fig. 2.), and that the fhip has moved forwards through the fpace equal to the line *b c*, while the lead has defcended through the line *a c* ; it is evident, that it is impoffible, in this cafe, to afcertain the exact depth, as a quantity of line, equal to *a b*, would be paid out, whereas the true depth is equal only to the line *a c*, which is much lefs. But the cafe is very different when the patent founding machine is ufed, as the operation ceafes when it has reached the bottom ; nor is the ftray-line, *a b*, whatever its length, at all taken into the account. Fig. 2.

" It has been extremely difficult, and fometimes impoffible, to obtain foundings in very deep water with the common lead, which may perhaps be thus accounted for. The common line which is ufed for founding, though, if left to itfelf, it would fink in water, yet its defcent would be much flower than that of the lead, feparately ; it confequently follows, that the lead muft be fo much impeded by carrying the line with it, that when it does reach the bottom, there will be fcarcely any fenfible check to enable the feaman to know the precife moment. Indeed, if he can afcertain even this to a certainty, he ftill cannot depend upon the truth of his foundings ; for if there be the leaft drift or current, the line itfelf will affume a curve, fimilar to that of the line of a kite in the air. Thefe two caufes will always operate

rate againſt the perfection of the common mode of ſounding.

" After ſo fully deſcribing the principle of the patent ſounding machine, it is ſcarcely neceſſary to prove, that is liable to neither of the foregoing objections; and it may be ſufficient to ſay, that, as it will certainly find its way to the bottom, if a ſufficient portion of ſtray-line be allowed to guard againſt its being checked in its progreſs, and the certainty of its having reached the bottom may be aſcertained by the arming, there can be no doubt of the practicability of its obtaining ſoundings, in any depth, and no reaſonable doubt of their correctneſs when obtained.

" From the conſtruction of this machine, it might be imagined, that the rotator would impede its motion through the water, and that it could not deſcend ſo rapidly as the common lead; but during repeated trials, in thirteen fathoms water, in which the rotator was frequently detached, and the lead ſuffered to deſcend alone, there was no difference perceptible in the time of their deſcent, though an excellent quarter-ſecond ſtop watch was uſed during the experiment, to detect any change. The following table ſhows how very uniformly the times of deſcent correſponded with the depths in fathoms, during a ſeries of trials made on the river Merſey, with the patent lead, weighing 14 pounds.

"The manner of conducting theſe experiments was ſuch as is deſerving of perfect reliance. Two pilots, of well-known ability and experience, were employed: one threw the lead, and the other, the moment he found, by the ſlackening of the rope, that the weight had arrived at the bottom, cried ' ſtop,' to a third perſon who held the watch.

" Taken when under ſail, at upwards of five knots in the hour.

" Several captains and maſters in the navy have made trial of the log and ſounding machine, and given very favourable reports of their performance; and it has been adopted by order of the Navy Board in the Britiſh navy *."

* Nicol. Journal, xxi. 250.

SOUP, a ſtrong decoction of fleſh or other ſubſtances.

Portable or dry ſoup is a kind of cake formed by boiling the gelatinous parts of animal ſubſtances till the watery parts are evaporated. This ſpecies of ſoup is chiefly uſed at ſea, and has been found of great advantage. The following receipt will ſhow how it is prepared.

Of calves feet take 4; leg of beef 12 lbs.; knuckle of veal 3 lbs; and leg of mutton 10 lbs. Theſe are to be boiled in a ſufficient quantity of water, and the ſcum taken off as uſual; after which the ſoup is to be ſeparated from the meat by ſtraining and preſſure. The meat is then to be boiled a ſecond time in other water; and the two decoctions, being added together, muſt be left to cool, in order that the fat may be exactly ſeparated. The ſoup muſt then be clarified with five or ſix whites of eggs, and a ſufficient quantity of common ſalt added. The liquor is then ſtrained through flannel, and evaporated on the water-bath to the conſiſtence of a very thick paſte; after which it is ſpread rather thin upon a ſmooth ſtone, then cut into cakes, and laſtly dried in a ſtove until it becomes brittle; theſe cakes are kept in well cloſed bottles. The ſame proceſs may be uſed to make a portable ſoup of the fleſh of poultry; and aromatic herbs may be uſed as a ſeaſoning, if thought proper.

Theſe tablets or cakes may be kept four or five years. When intended to be uſed, the quantity of half an ounce is put into a large glaſs of boiling water, which is to be covered, and ſet upon hot aſhes for a quarter of an hour, or until the whole is entirely diſſolved. It forms an excellent ſoup, and requires no addition but a ſmall quantity of ſalt.

SOUR-CROUTE. See CROUTE.

SOUR-Gourd, or *African Calabaſh-tree*. See ADANSONIA, BOTANY *Index*.

SOUTH, DR ROBERT, an eminent divine, was the ſon of Mr William South a merchant of London, and was born at Hackney near that city in 1633. He ſtudied at Weſtminſter ſchool, and afterwards in Chriſtchurch college, Oxford. In 1654, he wrote a copy of Latin verſes to congratulate Cromwell upon the peace concluded with the Dutch; and the next year a Latin poem, entitled *Muſica Incantans*. In 1660 he was elected public orator of the univerſity; and the next year became domeſtic chaplain to Edward earl of Clarendon, lord-high chancellor of England. In 1663 he was inſtalled prebendary of Weſtminſter, admitted to the degree of doctor of divinity, and had a ſinecure beſtowed on him in Wales by his patron the earl of Clarendon; after whoſe retirement into France in 1667 he became chaplain to the duke of York. In 1670 he was inſtalled canon of Chriſt church in Oxford; and in 1676 attended as chaplain to Laurence Hyde, Eſq. ambaſſador extraordinary to the king of Poland. In 1678 he was preſented to the rectory of Iſlip in Oxfordſhire; and in 1680 rebuilt the chancel of that church, as he afterwards did the rectory-houſe belonging to it. After the revolution he took the oath of allegiance to King William and Queen Mary, though he excuſed himſelf from accepting a great dignity in the church, vacated by the perſonal refuſal of that oath. His health began to decline ſeveral years before his death, which happened in 1716. He was interred in Weſtminſter Abbey, where a monument is erected to his memory. He publiſhed, 1. Animadverſions on Dr Sherlock's Vindication of the Holy and Ever Bleſſed Trinity. 2. A Defence of his Animadverſions. 3. Sermons, 8 vols 8vo. And after his deceaſe were publiſhed his *Opera Poſthuma Latina*, and his poſthumous Engliſh works. Dr South was remarkable for his wit, which abounds in all his writings, and particularly in his ſermons; but at the ſame time they equally abound in ill-humour, ſpleen, and ſatire. He was remarkable for being a time-ſerver. During the life of Cromwell he was a ſtaunch Preſbyterian, and then railed againſt the Independents: at the Reſtoration

tion he exerted his pulpit-eloquence againſt the Preſbyterians; and in the reign of Queen Anne, was a warm advocate for Sacheverel.

SOUTH, one of the four cardinal points from which the winds blow.

SOUTH Sea, or *Pacific Ocean*, is that vaſt body of water interpoſed between Aſia and America. It does not, however, ſtrictly ſpeaking, reach quite to the continent of Aſia, excepting to the northward of the peninſula of Malacca: for the water interpoſed between the eaſtern coaſt of Africa and the peninſula juſt mentioned has the name of the *Indian ocean*. The South ſea then is bounded on one ſide by the weſtern coaſt of America, through its whole extent, from the unknown regions in the north to the ſtraits of Magellan and Terra del Fuego, where it communicates with the ſouthern part of the Atlantic. On the other ſide, it is bounded by the coaſt of Aſia, from the northern promontory of Tſchukotſkoi Noſs, to the peninſula of Malacca already mentioned. Thence it is bounded to the ſouthward by the northern coaſts of Borneo, Celebes, Macaſſar, New Guinea, New Holland, and the other iſlands in that quarter, which divide it from the Indian ocean. Then, waſhing the eaſtern coaſt of the great iſland of New Holland, it communicates with that vaſt body of water encompaſſing the whole ſouthern part of the globe, and which has the general name of the *Southern ocean* all round. Thus does this vaſt ocean occupy almoſt the ſemicircumference of the globe, extending almoſt from one pole to the other, and about the equatorial parts extending almoſt 180° in longitude, or 12,500 of our miles.

The northern parts of the Pacific ocean are entirely deſtitute of land; not a ſingle iſland having yet been diſcovered in it from the latitude of 40° north and upwards, excepting ſuch as are very near the coaſt either of Aſia or America; but in the ſouthern part there are a great number.

Till very lately the South ſea was in a great meaſure unknown. From the great extent of ice which covers the ſouthern part of the globe, it was imagined that much more land exiſted there than in the northern regions: but that this could not be juſtly inferred merely from that circumſtance, is plain from what has been advanced under the article AMERICA, N° 3—24; and the ſouthern continent, long known by the name of *Terra Auſtralis*, has eluded the ſearch of the moſt expert navigators ſent out from Britain and France by royal authority. See TERRA AUSTRALIS.

SOUTH Sea Company. See COMPANY.

SOUTHAMPTON, a ſea-port town of Hampſhire in England. It is commodiouſly ſeated on an arm of the ſea; is a place of good trade, and well inhabited. It is ſurrounded by walls and ſeveral watch-towers, and had a ſtrong caſtle to defend the harbour, now in ruins. It is a corporation and a county of itſelf, with the title of an earldom, and ſends two members to parliament. W. Long. 1. 26. N. Lat. 50. 55.

SOUTHERN, THOMAS, an eminent dramatic writer, was born at Dublin in 1660, and received his education in the univerſity there. He came young to London to ſtudy law; but inſtead of that devoted himſelf to poetry and the writing of plays. His Perſian Prince, or Loyal Brother, was introduced in 1682, when the Tory intereſt was triumphant in England; and the character of the Loyal Brother being intended to compliment James duke of York, he rewarded the author when he came to the throne with a commiſſion in the army. On the Revolution taking place, he retired to his ſtudies, and wrote ſeveral plays, from which he is ſuppoſed to have derived a very handſome ſubſiſtence, being the firſt who raiſed the advantage of play-writing to a ſecond and third night. The moſt finiſhed of all his plays is Oroonoko, or the Royal Slave, which is built on a true ſtory related in one of Mrs Behn's novels. Mr Southern died in 1746, in the 86th year of his age; the latter part of which he ſpent in a peaceful ſerenity, having, by his commiſſion as a ſoldier, and the profits of his dramatic works, acquired a handſome fortune; and being an exact economiſt, he improved what fortune he gained to the beſt advantage. He enjoyed the longeſt life of all our poets; and died the richeſt of them, a very few excepted. His plays are printed in two vols 12mo.

SOUTHERN Continent. See AMERICA, N° 3—24, and *TERRA Auſtralis*.

SOY. See DOLICHOS.

SOZOMENUS, HERMIAS, an eccleſiaſtical hiſtorian of the 5th century, was born in Bethelia, a town of Paleſtine. He was educated for the law, and became a pleader at Conſtantinople. He wrote an Abridgment of Eccleſiaſtical Hiſtory, in two books, from the aſcenſion of our Saviour to the year 323. This compendium is loſt; but a continuation of it in nine books, written at greater length, down to the year 440, is ſtill extant. He ſeems to have copied Socrates, who wrote a hiſtory of the ſame period. The ſtyle of Sozomenus is perhaps more elegant; but in other reſpects he falls far ſhort of that writer, diſplaying throughout his whole book an amazing credulity and a ſuperſtitious attachment to monks and the monaſtic life. The beſt edition of Sozomenus is that of Robert Stephen in 1544. He has been tranſlated and publiſhed by Valeſius, and republiſhed with additional notes by Reading at London, 1720, in 3 vols folio.

SPA, a town of Germany, in the circle of Weſtphalia and biſhopric of Liege, famous for its mineral waters, lies in E. Long. 5. 50. N. Lat. 50. 30. about 21 miles ſouth-eaſt from Liege, and 7 ſouth-weſt from Lomburg. It is ſituated at one end of a deep valley on the banks of a ſmall rivulet, and is ſurrounded on all ſides by high mountains. The ſides of theſe mountains next to Spa are rude and uncultivated, preſenting a rugged appearance as if ſhattered by the convulſions of earthquakes; but as they are ſtrewed with tall oaks and abundance of ſhrubs, the country around forms a wild, romantic, and beautiful landſcape. The acceſs to the

Spa.

town is very beautiful. The road winds over the mountains till it defcends to their bottom, when it runs along a fmooth valley for a mile or a mile and a half.

The town confifts of four ftreets in form of a crofs, and contains about 400 inhabitants. Spa has no wealth to boaft of. It can fcarcely furnifh the neceffaries of life to its own inhabitants during the winter, and almoft all the luxuries which are requifite for the great concourfe of affluent vifitors during the fummer are carried from Liege by women. Its only fource of wealth is its mineral waters. No fooner does the warm feafon commence, than crowds of valetudinarians arrive, as well as many other perfons who are attracted folely by the love of amufement, and fome from lefs honourable motives. The inhabitants, who fpend feven or eight months of the year without feeing the face of a ftranger, wait for the return of this period with impatience. The welcome found of the carriages brings multitudes from the town, either to gratify their curiofity, or to offer their fervices in the hopes of fecuring your employment while you remain at Spa. Immediately after your arrival, your name and defignation is added to the printed lift of the annual vifitors; for which you pay a ftated fum to the bookfellers, who has a patent for this purpofe from the prince bifhop of Liege. This lift not only enables one to know at a glance whether any friends or acquaintance are refiding there, but alfo to diftinguifh perfons of rank and fafhion from adventurers, who feldom have the effrontery to infert their names.

There are two different ways of accommodating the vifitors at Spa with lodging and neceffaries. People may either lodge at a hotel, where every thing is furnifhed them in a fplendid and expenfive ftyle; or they may take up their refidence in private lodgings, from which they may fend for provifions to a cook's fhop.

Among the people who vifit Spa, there are many perfons of the firft rank and fafhion in Europe. Perhaps indeed there is no place in Europe to which fo many kings and princes refort; but it is alfo vifited by many felf-created nobility, who, under the titles of counts, barons, marquifes, and knights, contrive by their addrefs, and artifices, to prey upon the rich and unexperienced.

Spa.

The manners eftablifhed at Spa are conducive both to health and amufement. Every body rifes early in the morning, at fix o'clock or before it, when a great many horfes ftand ready faddled for thofe who choofe to drink the Sauveniere or Geronftere waters at a little diftance from Spa. After this healthy exercife a part of the company generally breakfaft together at Vauxhall, a magnificent and fpacious building. At this place a number of card-tables are opened every forenoon, round which many perfons affemble and play for ftakes to a very confiderable amount. A ball too is generally held once a week at Vauxhall, befides two balls at the affembly rooms near the Pouhon in the middle of the town.

The moft remarkable waters at Spa are, 1. The Pouhon, fituated in the middle of the town; 2. The Sauveniere, a mile and a half eaft from it; 3. Groifbeck, near to the Sauveniere; 4. Tonnelet, fituated a little to the left of the road which leads to the Sauveniere; 5. Geronftere, two miles fouth from Spa; 6. Wartroz, near to the Tonnelet; 7. Sarts or Nivefet, in the diftrict of Sarts; 8. Chevron or Bru, in the principality of Slavelot; 9. Couve; 10. Beverfe; 11. Sige; 12. Geremont. Thefe four laft are near Malmedy.

Dr Brownrigg was the firft perfon who difcovered that fixed air, or, as it is now generally called, *carbonic acid gas*, forms a principal ingredient in the compofition of the Spa waters, and actually feparated a quantity of this elaftic fluid, by expofing it to different degrees of heat from 110° to 170° of Fahrenheit. From 20 ounces 7 drams and 14 grains apothecaries weight of the Pouhon water, he obtained 8 ounces 2 drams and 50 grains. Since June 1765, when Dr Brownrigg read a paper on this fubject before the Royal Society of London, the waters of Spa have been often analyfed, but perhaps by none with more accuracy than by Dr Afh, who publifhed a book on the chemical and medicinal properties of thefe waters in 1788. We fhall prefent the refult of his analyfis of the five principal fprings in the following table.

Fountains.	Quantity of Water.	Ounce meafures of Gas.	Solid contents.	Aerated Lime.	Aerated Magnefia.	Aerated Mineral Alkali.	Aerated iron.	Selenite	Aerated Vegetab. Alkali.
	Ounces.		Grains.						
Pouhon	33.	35.75	16.25	2.75	9.50	2.25	1.75	—	—
Geronftere	32.75	24.75	5.50	2.50	—	1.75	0.75	0.50	—
Sauveniere	32.50	33.50	3.75	1.50	—	0.75	0.50	—	1.
Groifbeck	32.25	35.50	5.25	1.50	—	1.	0.75	—	2.
Tonnelet	32.	40.75	2.00	0.25	—	0.75	1.	—	—

The Pouhon fpring rifes from the hill to the north of Spa, which confifts of argillaceous fchiftus and ferruginous flate. The other fountains rife from the furrounding hills to the fouth eaft, fouth, weft, and northweft of the town; and this ridge of mountains is formed of calcareous earths mixed with filiceous fubftances. The furface of the mountains is covered with woods, interfperfed with large boggy fwamps filled with mud and water. The Pouhon is confidered as the principal fpring at Spa, being impregnated with a greater quantity of iron than any of the reft, and containing more fixed air than any except the Tonnelet. It is from this fpring that the Spa water for exportation is bottled; for which the demand is fo great, that, according to the beft information which Mr Thickneffe could obtain, the quantity exported amounts to 200,000 or 250,000 bottles annually. This exported water is inferior in its virtue to that which is drunk on the fpot; for the veffels into which it is collected are injudicioufly expofed to the fun, rain, wind, and duft, for feveral hours before they are corked, by which means a confiderable part of its volatile ingredients muft be evaporated; for it has been

Thickneffe's Journey through the Pais Bas.

been found by experiment, that by expofing it to a gentle heat, air-bubbles afcend in great numbers. It is in its greateft perfection when collected in cold dry weather; it is then pellucid, colourlefs, and without fmell, and almoft as light as diftilled water. It varies in its heat from 52° or 53° to 67° of Fahrenheit's thermometer.

The Geronftere is a much weaker chalybeate water than the Pouhon; and as it is exceedingly naufeous, and taftes and fmells like rotten eggs, it certainly contains fome hepatic gas. This is a circumftance which Dr Afh feems not to have attended to fufficiently. The Sauveniere water alfo, when newly taken from the well, fmells a little of fulphur. The Groifbeck contains more alkali, and almoft as much gas as the Pouhon, and has been celebrated for its good effects in the cafe of calculous concretions. The Tonnelet contains more gas than any of the reft. So fmall is the quantity of any foffil body held in fufpenfion by the aerial acid in it, and fo volatile is the gas, that it begins to pafs off very rapidly the moment it is taken out of the well, and in a fhort time is entirely gone. Dr Afh informs us, that in the neighbourhood of this well, the cellars, on any approaching change of weather, are found to contain much fixed air; and the beft prognoftic which they have of rain is the averfion which cats fhow to be carried into thefe cellars.

The Spa waters are diuretic, and fometimes purgative. They exhilarate the fpirits with an influence much more benign than wine or fpirituous liquors, and they are more cooling, and allay thirft more effectually than common water. They are found beneficial in cafes of weaknefs and relaxation, either partial or univerfal; in nervous diforders; in obftructions of the liver and fpleen; in cafes where the blood is too thin and putrefcent; in cafes of exceffive difcharges proceeding from weaknefs; in the gravel and ftone; and in moft cafes where a ftrengthening remedy is wanted. But they are hurtful in confirmed obftructions attended with fever, where there is no free outlet to the matter, as in ulcerations of the lungs. They are alfo injurious to bilious and plethoric conftitutions, when ufed before the body is cooled by proper evacuations.

SPACE. See METAPHYSICS, Part II. Chap. iv.

SPACE, in *Geometry*, denotes the area of any figure, or that which fills the interval or diftance between the lines that terminate it.

SPADIX, in *Botany*, anciently fignified the receptacle of the palms. It is now ufed to exprefs every flower-ftalk that is protruded out of a fpatha or fheath.

The fpadix of the palms is branched; that of all other plants fimple. This laft cafe admits of fome variety; in *calla*, *dracontium*, and *pothos*, the florets cover it on all fides; in *arum*, they are difpofed on the lower part only; and in *zoftera* on one fide. See BOTANY.

SPAGIRIC ART, a name given by old authors to that fpecies of chemiftry which works on metals, and is employed in the fearch of the philofopher's ftone.

SPAHIS, horfemen in the Ottoman army, chiefly raifed in Afia. The great ftrength of the grand feignior's army confifts in the janifaries, who are the foot; and the fpahis, who are the horfe.

1 Situation and boundary.

SPAIN. The kingdom of Spain, which occupies by far the greater portion of the fouth-weftern peninfula of Europe, is bounded on the north by the bay of Bifcay and Pyrenean mountains, which feparate it from France; on the eaft by the Mediterranean fea; on the fouth by the ftraits of Gibraltar, which divide it from the African kingdom of Morocco; and on the weft, partly by the Atlantic ocean, but chiefly by the narrow kingdom of Portugal. This laft is the only artificial boundary of the Spanifh territory, and confifts of ideal lines, except in three parts, where the river Minho to the north, and the Douro and the Chanca, till its junction with the Guadiana to the eaft, form rather more natural limits.

2 Extent.

From Cape Ortegal in N. Lat. 43° 44′, to the rock of Gibraltar, in N. Lat. 35° 57′, the continent of Spain extends through nearly 8° of latitude, while its extent from weft to eaft, viz. from Cape Finifterre in Long. 9° 17′ W. from Greenwich to Cape Creus, or Croix, in Long. 3° 30′ E. from the fame meridian, comprehends nearly 13° of longitude. In Britifh miles, its length from north to fouth, viz. from Cape Penas to Gibraltar, may be eftimated at 550 miles, while its medium breadth may be computed at 440. According to De Laborde, its fuperficial extent, exclufive of Portugal, is 25,137 fquare French leagues, or about 21,000 fquare Englifh leagues.

Befides the continental part of Spain, this monarchy comprehends feveral iflands in the Mediterranean, efpecially Majorca, Minorca, and Iviça; the Canary iflands, and feveral places on the north-weftern coaft of Africa; the Philippine and Ladrone iflands; together with an immenfe territory both in North and South America, comprehending Mexico, or New Spain, New Mexico, the ifland of Cuba, Porto Rico, &c. in North America, and in the fouthern part of that continent, the greateft portion of *Terra Firma*, Peru, Chili, almoft the whole of Paraguay, with an extenfive territory lying on the banks of the river Plate.

3 Divifion.

The ufual divifion of the Spanifh continent is into fourteen provinces, viz. thofe of CATALONIA, ARAGON, and NAVARRE, on the confines of France; BISCAY, ASTURIAS, and GALLICIA, on the fhores of the Atlantic; LEON and ESTREMADURA, on the fide of Portugal; ANDALUSIA chiefly on the ftraits of Gibraltar; GRANADA, MURCIA, and VALENCIA, on the fhores of the Mediterranean; OLD and NEW CASTILE in the centre.

The lateft writer on the geography of Spain, De Laborde, reckons only 13 provinces, as he includes Granada under Andalufia. In the following table we have brought together the moft important circumftances refpecting each of thefe provinces, viz. their fubdivifions, extent in fquare Britifh miles, population at the end of the 18th century, and chief towns; and we have arranged the provinces in the order followed by Laborde.

SPAIN

Some account of thefe provinces will be found under the articles ANDALUSIA, ARAGON, ASTURIAS, BISCAY, CASTILE, CATALONIA, ESTREMADURA, GALLICIA, GRANADA, LEON, MURCIA, NAVARRE, VALENCIA, IVICA, MAJORCA and MINORCA; but, for the beft view of their prefent ftate, we muft refer our readers to De Laborde's *View of Spain*, vols i. ii. and iii. or to Playfair's *Geography*, vol. i.

In its general appearance, Spain prefents a pleafing variety of hill and dale, mountain and valley. It muft be regarded as a mountainous country, its plains being few in number and of fmall extent. The moft remarkable of thefe occupies the centre of the kingdom, efpecially New Caftile, which forms the moft elevated tract of level country to be found in Europe, having a mean elevation of more than 300 fathoms above the level of the fea. The country is well wooded, and abounds with rivers; but thefe are often very deficient in water, and

4 Face of the country.

Spain, eſpecially on its eaſtern coaſt, is remarkable for the dryneſs of its ſoil. Notwithſtanding this aridity, however, moſt parts of the kingdom teem with fertility, and native verdure and high cultivation render the ſcenery delightful. Here and there, indeed, occurs a tract of deſert utterly incapable of cultivation; but, in general, nature has done much more for the country than the labour of its inhabitants.

5 Soil. The ſoil is ſaid to be in general light, and eaſily wrought; but on many parts of the eaſtern coaſt it is compoſed chiefly of a ſtiff loam or clay. The moſt fertile parts of the kingdom are in Valencia, on the coaſt of Granada, in the kingdom of Old Caſtile, and in ſeveral parts of thoſe of New Caſtile and Leon. The ſoil of Catalonia is very diſcouraging, except in the valleys, and the ſame may be ſaid of all the provinces bordering on the Pyrenees; the ſoil of Eſtremadura, though naturally good, has been ſo long abandoned to itſelf, that it has almoſt ceaſed to produce, and that of Andaluſia has a very mixed character. The ſoil of Murcia is uncommonly arid; that of the Aſturias cold; that of Gallicia extremely wet. In the neighbourhood of Carthagena there is an extenſive tract, which is ſo covered with ſtones as to form a deſert as ſterile and untameable as any on the ſandy plains of Africa or Arabia.

6 Mountains. We have ſaid that Spain is a mountainous country. The chain of the Pyrenees, common to it and France, is by no means the moſt conſiderable in point either of elevation or extent; though that chain may be regarded as the common root or origin of all the reſt. From the weſtern corner of the Pyrenees a vaſt ridge branches off through Navarre, Biſcay, Aſturias, and Gallicia, terminating only at Cape Finiſterre, and Cape Ortegal. This ridge is the *Cantabrian* mountains, and is diſtinguiſhed into ſeveral ſubordinate groups, denominated from the principal towns ſituated in their vicinity. Thus we have the mountains of Mondonedo in Gallicia. In general, theſe groups are called *Sierras*, from the jagged or *ſerrated* appearance of their tops; as the *Sierra de la Aſturias*, *Sierra d'Avila*, &c. The ſubordinate mountains that extend from the Sierra of the Aſturias in the north, to the Alpuxaras in the ſouth, run in parallel lines; and the ſame direction prevails in the mountains of Saint Andero, which join the Pyrenees.

From the mountains of Biſcay ariſes a main ridge, which, after proceeding a little to the ſouth, divides into three or four branches. Of theſe the moſt northerly chain ſeparates the provinces of Old Caſtile and New Caſtile, extending to the confines of Portugal, and called the mountains of Guadarrama. A ſecond branch divides the principal part of New Caſtile from the province of La Mancha, running from the north-eaſt to the ſouth-weſt, as far as Badajos in Eſtremadura. The moſt remarkable part of this chain is the Sierra of Guadalupe. South of theſe runs the Sierra Morena, or Sable mountains, rendered claſſical by the inimitable pen of Cervantes. This is the laſt chain till we reach the Alpuxaras, that extend through the provinces of Granada and Andaluſia.

Of theſe mountains there are two points, which, in elevation, exceed Mont Perdu, the higheſt of the Pyrenees, viz. the Pico de Venleta, in the Sierra Nevada, or ſnowy mountains of Granada, which is elevated more than 1781 fathoms above the level of the ocean, and the peak of Mulahaſen, in the ſame chain, raiſed above 1824 fathoms, which is within 76 fathoms of the peak of Teneriffe.

7 Capes and promontories. The principal capes and promontories of the Spaniſh continent are, Cape Creus, Cape St Antoine, oppoſite the iſland of Iviça; Cape Palas, near Carthagena; Cape de Gatte, near Almeria, and the promontory on which ſtands the town of Gibraltar, all on the coaſt of the Mediterranean; and Cape Machicaco, Cape Penas, Cape Ortegal, the promontory of Ferrol, Cape Finiſterre, and Cape Trafalgar, on the coaſts of the Atlantic.

8 Bays and gulfs. The principal bays and gulfs on the coaſt of Spain, purſuing the ſame courſe, are the following; the bay of Valencia, the bay of Alicant, the gulf of Carthagena, the bay of Almeria, the bay of Gibraltar, the harbour of Cadiz, the bay of Corunna, commonly called the Groyne, and the bay of Biſcay.

9 Rivers. The rivers of Spain are intimately connected with the mountains from which they derive their ſource, and between the chains of which they generally flow. The moſt important are, the Ebro, riſing in the mountains of Santillana in the Aſturias, and running in a ſouth-eaſtern direction between the Caſtiles and Valencia on the one hand, and the provinces of Navarre, Aragon, and Catalonia, on the other, till it reaches the Mediterranean, at a ſmall diſtance from Tortoſa; the Xacar, riſing in the Sierra of Cuença in New Caſtile, and flowing into the Mediterranean conſiderably to the ſouthward of Valencia; the Segura, riſing in a mountain of the ſame name, traverſing the province of Murcia, and meeting the Mediterranean about midway in the capital of that province, and Alicant. Theſe flow into the Mediterranean, and there are ſeveral other rivers of leſs note, which pour their waters into the ſame ſea, and which we can merely enumerate. Theſe are the Ter at Gerona, the Lobregate at Barcelona, and the Mijares, paſſing by Segorbe. The rivers which flow into the Atlantic are, the Guadalquiver, riſing at the foot of Mount Segura, from the oppoſite ſide of which originates the river of the ſame name, flowing with a ſluggiſh courſe through the province of Andaluſia, and meeting the Atlantic a little to the north-weſt of Xeres; the Guadiana, riſing among ſome lakes to the north-weſt of Alcaraz in New Caſtile, and paſſing between the Sierra Morena and the Sierra de Guadalupe, till, near Badajos, it enters the kingdom of Portugal, and runs nearly in a ſoutherly direction, till it meets the Atlantic at Ayamonte; the Tagus, riſing among the mountains of Albaraçin in New Caſtile, and running weſterly till, at Alcantara, it becomes a river of Portugal; the Douro, riſing in Old Caſtile near Soria, and paſſing by Valladolid and Zamora, near which it forms a part of the boundary of Portugal; the Minho, riſing in the mountains of Gallicia, and running to the ſouth-weſt, till it meets the Atlantic to the north of Camina. The only other river of any importance in this direction is the Lima, ſuppoſed to be the Lethe of the poets, which riſes in Gallicia, and flows into the ſea below Viara.

10 Lakes. If we except the ſeries of ſmall lakes from which we have ſaid the river Guadiana takes its riſe, there are, in Spain, few lakes that merit particular notice. The moſt remarkable of theſe is the lake of Abulfera, in the province of Valencia. This lake begins near the village of Catarroija, about a league ſouth of the city of Valencia, and extends nearly four leagues as far as Cullera. When it

Spain. it is full, it is about four leagues long, two in breadth, and fix in circumference; but it is fo fhallow, that fmall boats can fcarcely float in it. To fupply the deficiency of water, an engine is employed, by which the neighbouring waters are drawn into the bed of the lake; and any fuperabundant water occafioned by heavy rains, is carried off into the fea by means of an artificial opening. This lake contains a great many fifh, and numerous aquatic birds make it their haunt. On certain days in the year the inhabitants of Valencia make incurfions hither to fhoot the birds, and the furface of the lake is at thefe times covered with boats.

11 Forefts. Many parts of the kingdom of Spain abound in large tracts of wood. Extenfive forefts are found in Catalonia, the Afturias, Gallicia, and in the Sierra Morena. It is in the mountainous chains that the forefts of Spain are moft remarkable; and there are few of thefe heights, except in the fnowy regions of the Sierra Nevada, but what are covered with wood almoft to their fummits.

12 Climates and feafons. The climate of Spain is as delightful as that of any part of Europe; and though at certain feafons of the year the eaftern coaft is fubject to exceffive heat and drought, and the north-weftern to almoft perpetual rains, the temperature is in general mild, and the air falubrious.

The climate of Spain has been admirably depicted by M. A. de Humboldt; and we fhall here prefent to our readers the fubftance of his remarks, as they are related by De Laborde, in his view of Spain.

No country of Europe prefents a configuration fo fingular as Spain. It is this extraordinary form which accounts for the drynefs of the foil in the interior of the Caftiles, for the power of evaporation, the want of rivers, and that difference of temperature which is obfervable between Madrid and Naples, two towns fituated under the fame degree of latitude.

The interior of Spain is, as we have feen, an elevated plane, which is higher than any of the fame kind in Europe, occupying fo large an extent of country. The mean height of the barometer at Madrid is 26 inches $2\frac{2}{3}$ lines. It is therefore $\frac{1}{11}$ lower than the mean height of the mercury at the level of the ocean. This is the difference of the preffure of the atmofphere that is experienced by all bodies expofed to the air at Madrid, and at Cadiz and Bourdeaux. At Madrid the barometer falls as low as 25 inches 6 lines, and fometimes even lower.

The following is a table of the variations in the height of the barometer during the firft nine months of the year 1793.

Months.	Maximum.		Minimum.		Mean Height of the Mercury	
1793.	Inches.	Lines.	Inches.	Lines	Inches.	Lines
January,	26	5.8	25	9.8	26	2.6
February,	26	5.3	25	6.2	26	1.6
March,	26	4.7	25	6.	25	11.6
April,	26	2.4	25	6.9	25	11.6
May,	26	4.6	25	10.5	26	0.8
June,	26	4.	25	11.8	26	1.6
July,	26	4.3	26	0.7	26	2.4
Auguft,	26	3.2	25	11.5	26	1.4
September,	26	4.3	25	11.	26	1.7

From the mean height of the barometer at Madrid, we find that capital to be elevated $309\frac{6}{10}$ fathoms above the level of the ocean. Madrid, confequently, ftands as high as the town of Infpruck, fituated in one of the higheft defiles of the Tyrol, while its elevation is 15 times greater than that of Paris, and three times greater than that of Geneva.

According to M. Thalacker, the mineralogift, who has taken feveral heights with the barometer in the environs of Madrid, the elevation of the king's palace at San Ildefonfo is 593 fathoms, which is higher than the edge of the crater of Mount Vefuvius, and is, ftrictly fpeaking, in the regions of the clouds, which generally float from 550 to 600 fathoms high.

The height of the plain of the Caftiles has an evident effect on its temperature. We are aftonifhed at not finding oranges in the open air under the fame latitude as that of Tarentum, part of Calabria, Theffaly, and Afia Minor; but the mean temperature of Madrid is very little fuperior to that of Marfeilles, Paris, and Berlin, and is nearly the fame with that of Genoa and Rome. The following table fhews the mean temperature at Madrid and at Rome, during the firft nine months of the years 1793 and 1807.

	At Madrid.			At Rome.		
Months	Deg. of Fahrenheit.			Deg. of Fahrenheit.		
January,	39°	3		40°	11′	15″
February,	43	24		47	49	30
March,	47	54		50	15	45
April,	52	19	30″	54	34	30
May,	59	4	30	65	56	15
June,	72	32	15	72	30	
July,	77	13	30	79	15	
Auguft,	81	34	30	79	15	
September,	65	45		72	34	30

Thus, the mean temperature at Madrid appears to be 59° of Fahrenheit, while that of the coafts of Spain, from the 41° to the 36° of Lat. is between $63\frac{3}{4}$° and 68° of Fahrenheit. In the former climate we find that orange trees will not flourifh in perfection, while in the latter we fee banana trees, heliconias, and even fugar-canes, growing in fituations that are fheltered from the cold winds.

13 Animals. Spain prefents few fpecies of animals that are not found in the other parts of fouthern Europe. Among the quadrupeds, we may remark, as peculiar to Spain, the genet, *(viverra genetta)*. The bear is found in feveral parts of the great Pyrenean chain, efpecially on fome of the mountains of Aragon, as well as thofe of Oecar and Reynofa in Old Caftile. Wolves are met with in all the higher and mountainous parts of the country, and wild boars on the mountains of Navarre, on the Pinar, and the Sierra de Carafcoy, in the kingdom of Valencia. The roebuck is found on fome of the mountains of Navarre, and the lynx and the ibex on thofe of Cuença in New Caftile, in the valleys of Aure and Giftau, as well as in the Pyrenees. The glory of Spanifh zoology is the horfe, for which this kingdom has been famous in all ages. The Spanifh horfes

Spain.

horses have probably originated from the Barbs of the north of Africa, supposed to be the immediate offspring of the Arabian breed. The Spanish mules are also excellent, and the ass is here no ignoble animal, though not equal to those of Arabia. There is little remarkable in the breed of cattle, but the Merino sheep have long been distinguished, and are perhaps superior to any in the world for the beauty of the fleece, if not for the delicacy of the mutton. The flocks of Merino sheep are sometimes extremely large, and Mr Townsend mentions one nobleman who possessed not fewer than 40,000. The whole number in the kingdom may be estimated at about 5,000,000. These animals were, by a special code, called the *Mesta*, authorised to travel from one province to another, according as the season presented the best pasturage in the mountains or the plains. The fleece of the Merino sheep is esteemed double in value to that of any other breed.

Of the birds more peculiarly found in Spain, the *vulture*, *percnopterus*, the *cuculus glandarius*, *cuculus tridactyla*, *motacilla hispanica*, *hirundo mellia*, and *hirundo rupestris*, are the most remarkable.

Fresh-water fishes are very plentiful in the Spanish rivers; but those in most esteem are from the small river Tormes in Old Castile, where have been taken trout of 20 lbs. weight. The tench of the lakes near Tobar in New Castile, are remarkably fine and delicate, and are taken in great abundance every year, during the months of May and June. The fish taken on the coasts are much the same as those of the other countries bordering on the Mediterranean and the Atlantic. The tunny was formerly taken on the eastern coast, where it formed a particular branch of the fishery, but is now, we believe, little regarded.

Among the Spanish insects, the most remarkable are, the cantharides, (*meloë vesicatorius*), and the kermes insect (*coccus ilicis*). The latter insect is much cultivated as an article of dyeing, especially in the territory of Bujalance, and of Fernan Nunes in the kingdom of Cordova, as also in the vicinity of the town of De las Aguas, four leagues from Alicant, and near the river Henares, in New Castile. The evergreen oaks on which these animals feed, present in the spring, a most singular appearance, from the red *nidi* of the kermes, with which their leaves are covered.

14 Vegetables.

No country of Europe of the same extent, furnishes such an ample field for the researches of the botanist, as Spain; and indeed its botany constitutes a very important part of its natural history. The mountainous districts are clothed with the ever-green oak, the common oak, the chesnut, and in some places various species of pine; but their most useful production is the cork tree. The smaller heights produce the wild olive, the almond, the shumac, the laurel, the bay, the cypress, Canary and Portugal broom, the yellow jessamine, and the Provence rose. The vine, the palm tree, the orange, the lemon and the olive, are so nearly naturalized as to require but little cultivation; and the same may be said of the kali (*salsola soda*), which is produced in large quantities on the coasts, and furnishes the best kind of kelp, commonly called *barilla*, used in the manufacture of soap and glass. The plains and valleys are covered with many of those plants which form some of the greatest ornaments of our flower gardens, as the tulip, several species of iris, the pæony, the passion flower, the orange and martagon lily, the jonquil, several species of narcissus and hyacinth, and above all the rhododendron. The mountains, however, exhibit the greatest variety of botanical riches. Those most worthy of the visits and researches of the enterprising botanist, are, the Sierra de Guadalupe in Estremadura; the mountains of Moncayo in Aragon; of Pineda, Guadarrama, and Cuença, in New Castile; of Caroscoy, in the kingdom of Murcia; of Pena-Colosa, Mongi, Aytona, and Mariola, in the kingdom of Valencia, and the Pyrenees.

The sugar-cane, was, before the discovery of the West India islands, one of the most important objects of Spanish cultivation, and numerous sugar mills were established along the coast of the Mediterranean, especially in the kingdom of Granada. At the conquest of that Moorish kingdom, not fewer than fourteen sugar plantations and two mills, were found within the province. Some sugar canes are still cultivated in the kingdom of Valencia, but the manufacture of sugar is discontinued, and the canes are used only for distillation. There is, we believe, still a manufactory for sugar from Spanish canes in Granada.

15 Minerals.

Spain has long been celebrated for the riches of its mineral kingdom, and it may still be considered as the Mexico and Peru of Europe. There are few metals which may not be found in this kingdom; and, till the discovery of America put the Spaniards in possession of mines which far surpass their own in produce, the gold and silver mines of Spain were thought to be nearly the richest in the world. At present, no gold mines are wrought, but grains of that metal are found disseminated in ferruginous quartz, forming a vein that passes through a mountain near the village of San Ildefonso in Old Castile. Spangles of gold are found intermixed with emery, in a mine near Alocer in Estremadura, and in the territory of Molena in Aragon; and this metal is occasionally found in the sand of two rivers; the Agneda, in the kingdom of Leon, which rises from the mountains of Xalamo, and the Tagus in New Castile, especially in the vicinity of Toledo.

Silver is much more abundant, but most of its mines have also been abandoned. We believe the only silver mine now in work is that of the Sierra de Guadalupe, near the village of Logrozen, where the silver is found mixed with micaceous schistus. The most remarkable silver mines formerly worked are those of Alrodoval del Campo; of Zalamea on the road to Alocer in Estremadura; of Almazaron near Carthagena; three in the Sierra Morena, about a league from Guadalcanal, in the kingdom of Seville, and another about two leagues from Linarez, in the kingdom of Jaen. This last mine was well known both to the Carthaginians and the Romans; while Spain was under the dominion of the former it belonged to Himilca, the wife of Asdrubal. After having been long abandoned, it was again wrought in the 17th century, when a vein of ore five feet in diameter was discovered; at present, however, it is no longer in a state of activity.

Mines of copper are found near Pampeluna in Navarre, near Salva Tierra in Alava; near Escarray, and at the foot of the mountains of Guadarama in Old Castile; near Lorea in Murcia; near the Chartreuse of the Val de Christo in Valencia; in the Sierra de Guadalupe in Estremadura; in the mountains near Cordova; near Riotinto, and at la Canada de los Conejos in Seville; in

Spain. in the diſtrict of Albuladui in Granada, and near Lenarez in the kingdom of Jaen.

There are numerous lead mines, eſpecially near Tortoſa in Catalonia; at Zoma, Benaſques, and Plan in Aragon; near Logroſen and Alcoſer in Eſtremadura; in the mountain Guadarrama in Old Caſtile; near los Alumbres and Lorca in Murcia; at Alcaniz and Conſtantina in Seville, and at the diſtrict of Linarez in Jaen.

The mines of iron are abundant, and need not be enumerated. Of antimony there are two mines, both in the diſtrict of La Mancha. One of theſe is at Alendia, near Almodovar; the other at the foot of the Sierra Morena. There is only one mine of cobalt, viz. in the province of Aragon, found in the valley of Geſton. There are two mines of cinnabar in Valencia; one about two leagues from Alicant in the limeſtone mountains of Alcoray; the other between Valencia and San Felipe; and two others in the ſame province, that produce native mercury, but none of theſe are worked. The moſt abundant mine of mercury and cinnabar united is in the diſtrict of La Mancha, on the borders of Cordova. It is ſituated in a hill of ſandſtone which reſts on ſlate. The whole length of the hill is traverſed by two principal veins, both of which were wrought by the Romans. The whole of this mine was lately wrought by the agents of the king, and its produce was very abundant.

Plumbago is found in a thick vein intermixed with feldſpar, about a league from the village of Real Monaſterio, in the kingdom of Seville. Mines of ſulphur occur, both in Aragon and Murcia; jet has been found in the diſtrict of Old Colmenar, in Old Caſtile; and there is good evidence of the preſence of coal at ſeveral places in Catalonia, in the Aſturias, New Caſtile, and Aragon; but it is ſaid that no coal mines have as yet been opened.

The marbles of Spain are very numerous and valuable. A black marble, veined with white, is procured near Barcelona; many dendritic marbles occur near Tortoſa. Near the town of Molina, in Aragon, is found a granular marble ſpotted with red, yellow, and white. At the village of Salinos, in the diſtrict of Guipuzcoa, is a beautiful blue pyritical marble, containing marine ſhells. From Monte Sagarra, near Segorbia, in the province of Valencia, are procured ſeveral fine marbles, which were held in great eſtimation even by the Romans. The province of Granada, however, contains more valuable varieties of this beautiful mineral than all the reſt of Spain; of theſe ſome of the principal are the following. A pure white ſtatuary marble, of which the whole mountain of Filabra, near Almeria, is compoſed; a fleſh-coloured marble from a mountain near Antiquera; an exquiſitely beautiful wax-coloured alabaſter, from the vicinity of the city of Granada; and a finely veined marble from the Sierra Nevada.

16 Mineral waters.

Of the Spaniſh mineral waters the following are the moſt celebrated. The principal cold ſprings are, a hepatic water in the town of Buron, in Valencia; a carbonated water at Gerona, in Catalonia; a ſaline purgative water at Vacia-Madrid, three leagues from the capital, and another of a ſimilar nature near Toledo.

The principal hot ſprings are, the baths of Abu-Zulena, at Javal-Cohol, near Bæza; a hepatic ſpring uſed for bathing near Alhama de Granada; another near Almeria, in the province of Granada, to which are attached both bathing and vapour baths: all theſe were diſcovered, or at leaſt brought into general uſe, by the Moors. A very copious hot ſpring near Merida, in Eſtremadura, made uſe of by the Romans. The Calda de Bonar, in the neighbourhood of Leon, a ſpring of tepid water frequented by the Romans, and ſtill exhibiting the ruins of baths and ancient inſcriptions. A very hot ſpring near Orenſe, in Gallicia. A ſpring at Alhama, near Calatayud, in Aragon, formerly much frequented, but now in a ſtate of neglect. The Fuente de Buzot, near Alicant, a ſaline ſpring of the temperature of 104° Fahrenheit. A very copious and hot ſpring at Archena, near Murcia, where ſtill remain the ruins of Roman and Mooriſh baths. A hepatic ſpring near Arnedillo, in Old Caſtile. 17

Natural curioſities.

Among the natural curioſities of Spain, we may particularize the mountain of Montſerrat in Catalonia (ſee MONTSERRAT); the inſulated hill of rock ſalt near the town of Cardona, in Catalonia (ſee GEOLOGY, N° 102.); the ſubterranean lake contained within a cavern in the neighbourhood of the Cava Perella, in the iſland of Minorca; the ſtalactitic cave called St Michael's, on the weſt ſide of the rock of Gibraltar, and the river Guadiana, which appears and diſappears ſeveral times in the courſe of its progreſs to the ſea. 18

Spaniſh iſlands.

The various groups of iſlands that are ſubject to Spain have long been diſtinguiſhed by particular names. Thus *Majorca*, *Minorca*, *Cabrera* and *Dragonera*, were called by the ancients *Inſulæ Baleares*, and are ſtill named the *Balearic Iſles*; while Iviça and *Feromentara* form a leſſer group, denominated the *Pityuſe Iſles*. Of theſe iſlands, the latter were taken poſſeſſion of by the Carthaginians nearly 700 years before the Chriſtian era; and about 200 years after that enterpriſing people made themſelves maſters of the Balearic iſles. After the fall of Carthage, all theſe iſlands long maintained a ſtate of piratical independence, and only Majorca was ever completely ſubject to the Romans. In the time of Auguſtus we are told that the Balearic iſles were ſo infeſted with rabbits, that the inhabitants ſent deputies to Rome for aſſiſtance to deſtroy theſe formidable invaders of their plantations. In the year 426 of the Chriſtian era, theſe iſlands came into the poſſeſſion of the Vandals, from whom they were taken at the end of the 8th century by the African Moors. At the beginning of the 9th century they were ſeized on by a fleet ſent into the Mediterranean by Charlemagne; but they were ſoon after reconquered by the Moors, who maintained the ſovereignty in theſe iſlands till, in 1228, they were finally diſpoſſeſſed by Don James grandſon of Alphonſo II. king of Aragon. 19

Names of Spain.

Though Spain appears to have been known to the Phœnicians nearly 1000 years before the birth of Chriſt, it ſeems to have been little regarded by the Greeks till after the period when Herodotus compoſed his hiſtory. Some part of this country was probably the Tarſhiſh of Scripture, from which the Phœnicians imported gold, ſilver, and other precious commodities into Judea. When the Greeks had eſtabliſhed a colony at Marſeilles, they muſt have been well acquainted with at leaſt the northern part of this peninſula, to which they gave the names of Iberia and Celtiberia, from two nations who then inhabited the country, and of Heſperia, from its extreme ſituation in the weſt of the then known world. The name Hiſpania, from which its modern appellation

Spain. is derived, was beftowed on it by the Romans; but the etymology of this name is uncertain.

20 Original population. The Aborigines of Spain were doubtlefs a Celtic tribe, which probably paffed into this peninfula from the adjoining continent of Gaul, though at a very early period they appear to have been mixed with a colony of Mauritani, or Moors from the coaft of Africa. The Celtic inhabitants, or Celtiberi, feem to have poffeffed the north-eaft of the peninfula, while the Mauritani occupied the fouthern and fouth-weftern diftricts.

21 Spain invaded by the Carthaginians. An. 240. B. C. Nothing certain is known refpecting the early ftate of Spain, till the commencement of the firft Punic war between the Romans and the Carthaginians, in the middle of the third century before Chrift. Not long before this date, probably at the beginning of the century, the latter people had poffeffed themfelves of Catalonia, when their general Hamilcar Barcas is faid to have founded the city of Barceno, the modern Barcelona. The Carthaginian colony, however, feems to have been rather a mercantile than a warlike fettlement, and the Celtiberi were more the allies than the fubjects of their African neighbours. Of the contefts carried on between the Carthaginians and the Romans, till the final fubjugation of the former, and the confequent occupation of all their territories by the Roman republic, we have given an account under the articles CARTHAGE and ROME. We fhall here briefly confider the ftate of Spain at the time of its occupation by the Romans, and relate the events to which that occupation gave rife, and which are lefs connected with the more immediate tranfactions of the Punic wars.

22 State of Spain at the Roman conqueft. At the time of the Roman conqueft, Spain, though prodigious quantities of filver had been carried out of it by the Carthaginians and Tyrians, was yet a very rich country. In the moft ancient times, indeed, its riches are faid to have exceeded what is related of the moft wealthy country in America. Ariftotle affures us, that when the Phenicians firft arrived in Spain, they exchanged their naval commodities for fuch immenfe quantities of filver, that their fhips could neither contain nor fuftain its load, though they ufed it for ballaft, and made their anchors and other implements of filver. When the Carthaginians firft came to Spain, they found the quantity of filver nothing leffened, fince the inhabitants at that time made all their utenfils, and even mangers, of that precious metal. In the time of the Romans this amazing plenty was very much diminifhed; however, their gleanings were by no means defpicable, fince in the fpace of nine years they carried off 111,542 pounds of filver, and 4095 of gold, befides an immenfe quantity of coin and other things of value (A). The Spaniards were always remarkable for their bravery, and fome of Hannibal's beft troops were brought from thence; but as the Romans penetrated farther into the country than the Carthaginians had done, they met with nations whofe love of liberty was equal to their valour, and whom the whole ftrength of their empire was fcarcely able to fubdue. Of thefe the moft formidable were the Numantines, Cantabrians, and Afturians.

23 Succeffes of Viriathus againft the Romans. In the time of the third Punic war, one Viriathus, a celebrated hunter, and afterwards the captain of a gang of banditti, took upon him the command of fome nations who had been in alliance with Carthage, and ventured to oppofe the Roman power in that part of Spain called *Lufitania*, now Portugal. The prætor, named *Vetilius*, who commanded in thofe parts, marched againft him with 10,000 men; but was defeated and killed, with the lofs of 4000 of his troops. The Romans immediately difpatched another prætor with 10,000 foot and 1300 horfe: but Viriathus having firft cut off a detachment of 4000 of them, engaged the reft in a pitched battle; and having entirely defeated them, reduced great part of the country. Another prætor, who was fent with a new army, met with the fame fate; fo that, after the deftruction of Carthage, the Romans thought proper to fend a conful named *Quintus Fabius*, who defeated the Lufitanians in feveral battles, and regained two important places which had long been in the hands of the rebels. After the expiration of Fabius's confulate, Viriathus continued the war with his ufual fuccefs, till the fenate thought proper to fend againft him the conful Q. Cæcilius Metellus, an officer of great valour and experience. With him Viriathus did not choofe to venture a pitched battle, but contented himfelf with acting on the defenfive; in confequence of which the Romans recovered a great many cities, and the whole of Tarraconian Spain was obliged to fubmit to their yoke. The other conful, named *Servilianus*, did not meet with the fame fuccefs; his army was defeated in the field, and his camp was nearly taken by Viriathus. Notwithftanding the good fortune of Metellus, however, he could not withftand the intrigues of his countrymen againft him, and he was not allowed to finifh the war he had begun with fo much fuccefs. In refentment for this he took all imaginable pains to weaken the army under his command: he difbanded the flower of his troops, exhaufted the magazines, let the elephants die, broke in pieces the arrows which had been provided for the Cretan archers, and threw them into a river. Yet, after all, the army which he gave up to his fucceffor Q. Pompeius, confifting of 30,000 foot and 2000 horfe, was fufficient to have crufhed Viriathus if the general had known how to ufe it. But, inftead of oppofing Viriathus with fuccefs, the imprudent conful procured much more formidable enemies. The Termantians and Numantines, who had hitherto kept themfelves independent, offered very advantageous terms of peace and alliance with Rome; but Pompeius infifted on their delivering up their arms. Upon this war was immediately commenced. The conful with great confidence invefted Numantia; but being repulfed with confiderable lofs, he fat down before Termantia, where he was attended with ftill worfe fuccefs. The very firft day, the Termantines killed 700 of his legionaries; took a great convoy which was coming to the

(A) In this account we muft allow fomething for the exaggerations of fabulous hiftorians. There is no doubt, however, that Spain was at this time immenfely rich, and if we may believe Strabo, there was then a mine near Carthage which yielded every day 25,000 drams of filver, or about 300,000l. per annum.

Spain.

the Roman camp: and having defeated a conſiderable body of their horſe, puſhed them from poſt to poſt till they came to the edge of a precipice, where they all tumbled down, and were daſhed to pieces. In the mean time Servilius, who had been continued in his command with the title of *proconſul*, managed matters ſo ill, that Viriathus ſurrounded him on all ſides, and obliged him to ſue for peace. The terms offered to the Romans were very moderate; being only that Viriathus ſhould keep the country he at that time poſſeſſed, and the Romans remain maſters of all the reſt. This peace the proconſul was very glad to ſign, and afterwards procured its ratification by the ſenate and people of Rome.

24
The Romans ſurrounded on all ſides, and forced to conclude a peace with Viriathus.

The next year Q. Pompeius was continued in his command againſt the Numantines in Farther Spain, while Q. Servilius Cæpio, the new conſul, had for his province Hither Spain, where Viriathus had eſtabliſhed his new ſtate. Pompeius undertook to reduce Numantia by turning aſide the ſtream of the Durius, now the Douro, by which it was ſupplied with water; but, in attempting this, ſuch numbers of his men were cut off, that, finding himſelf unable to contend with the enemy, he was glad to make peace with them on much worſe terms than they had offered of their own accord. The peace, however, was ratified at Rome; but in the mean time Cæpio, deſirous of ſhowing his proweſs againſt the renowned Viriathus, prevailed on the Romans to declare war againſt him without any provocation. As Cæpio commanded an army greatly ſuperior to the Luſitanians, Viriathus thought proper to ſue for peace; but finding that Cæpio would be ſatisfied with nothing leſs than a ſurrender at diſcretion, he reſolved to ſtand his ground. In the mean time, the latter having bribed ſome of the intimate companions of Viriathus to murder him in his ſleep, he by that infamous method put an end to a war which had laſted 14 years, very little to the honour of the republic.

25
Viriathus treacherouſly murdered.

After the death of Viriathus, the Romans with like treachery ordered their new conſul Popilius to break the treaty with the Numantines. His infamous conduct met with the reward it deſerved; the Numantines ſallying out, put the whole Roman army to flight with ſuch ſlaughter, that they were in no condition to act during the whole campaign. Mancinus, who ſucceeded Popilius, met with ſtill worſe ſucceſs; his great army, conſiſting of 30,000 men, was utterly defeated by 4000 Numantines, and 20,000 of them killed in the purſuit. The remaining 10,000, with their general, were pent up by the Numantines in ſuch a manner that they could neither advance nor retreat, and would certainly have been all put to the ſword or made priſoners, had not the Numantines, with a generoſity which their enemies never poſſeſſed, offered to let them depart upon condition that a treaty ſhould be concluded with them upon very moderate terms. This the conſul very willingly promiſed, but found himſelf unable to perform. On the contrary, the people, not ſatisfied with declaring his treaty null and void, ordered him to be delivered up to the Numantines. The latter refuſed to accept him, unleſs he had along with him the 10,000 men whom they had relieved as before related. At laſt, after the conſul had remained a whole day before the city, his ſucceſſor Furius, thinking this a ſufficient recompenſe to the Numantines for breaking the treaty, ordered him to be received again into the camp. However, Furius did not chuſe to engage with ſuch a deſperate and reſolute enemy as the Numantines had ſhowed themſelves; and the war with them was diſcontinued till the year 133 B. C. when Scipio Æmilianus, the deſtroyer of Carthage, was ſent againſt them. Againſt this renowned commander the Numantines with all their valour were not able to contend. Scipio, having with the utmoſt care introduced ſtrict diſcipline among his troops, and reformed the abuſes which his predeceſſors had ſuffered in their armies, by degrees brought the Romans to face their enemies, which at his arrival they had abſolutely refuſed to do. Having then ravaged all the country round the town, it was ſoon blocked up on all ſides, and the inhabitants began to feel the want of proviſions. At laſt they reſolved to make one deſperate attempt for their liberty, and either to break through their enemies, or periſh in the attempt. With this view they marched out in good order by two gates, and fell upon the works of the Romans with the utmoſt fury. The Romans, unable to ſtand this deſperate ſhock, were on the point of yielding, when Scipio, haſtening to the places attacked, with no fewer than 20,000 men, the unhappy Numantines were at laſt driven into the city, where they ſuſtained for a little longer the miſeries of famine. Finding at laſt, however, that it was altogether impoſſible to hold out, it was reſolved by the majority to ſubmit to the pleaſure of the Roman commander. But this reſolution was not univerſally approved. Many ſhut themſelves up in their houſes, and died of hunger, while even thoſe who had agreed to ſurrender repented their offer, and ſetting fire to their houſes, periſhed in the flames with their wives and children, ſo that not a ſingle Numantine was left alive to grace the triumph of the conqueror of Carthage.

26
The Romans defeated by the Numantines.

Spain.

27
Scipio Æmilianus ſent againſt them.

An. 133. B. C.

28
Miſerable end of the people.

After the deſtruction of Numantia the whole of Spain ſubmitted to the Roman yoke; and nothing remarkable happened till the times of the Cimbri, when a prætorian army was cut off in Spain by the Luſitanians. From this time nothing remarkable occurs in the hiſtory of Spain till the civil war between Marius and Sylla. The latter having cruſhed the Marian faction, as related under the article ROME, proſcribed all thoſe that had ſided againſt him whom he could not immediately deſtroy. Among theſe was Sertorius, a man of conſummate valour and experience in war. He had been appointed prætor of Spain by Marius; and upon the overthrow of Marius, retired to that province. Sylla no ſooner heard of his arrival in that country, than he ſent thither one Caius Annius with a powerful army to drive him out. As Sertorius had but few troops along with him, he diſpatched one Julius Salinator with a body of 6000 men to guard the paſſes of the Pyrenees, and to prevent Annius from entering the country. But Salinator having been treacherouſly murdered by aſſaſſins hired by Annius for that purpoſe, he no longer met with any obſtacle; and Sertorius was obliged to embark for the coaſt of Africa with 3000 men, being all he had now remaining. With theſe he landed in Mauritania; but as his men were ſtraggling careleſsly about, great numbers of them were cut off by the Barbarians. This new misfortune obliged Sertorius to re-embark for Spain; but finding the whole coaſt lined with the troops of Annius, he put to ſea again, not knowing what courſe to ſteer. In this new voyage he met with a ſmall fleet of Cilician pirates; and having prevailed with

29
Sertorius ſupports the Marian faction in Spain.

30
Is driven out, and undergoes many hardſhips.

with them to join him, he made a deſcent on the coaſt of Iviça, overpowered the garriſon left there by Annius, and gained a conſiderable booty. On the news of this victory Annius ſet ſail for Iviça, with a conſiderable ſquadron, having 5000 land forces on board. Sertorius, not intimidated by the ſuperiority of the enemy, prepared to give them battle. But a violent ſtorm ariſing, moſt of the ſhips were driven on ſhore and daſhed to pieces, Sertorius himſelf with great difficulty eſcaping with the ſmall remains of his fleet. For ſome time he continued in great danger, being prevented from putting to ſea by the fury of the waves, and from landing by the enemy; at laſt, the ſtorm abating, he paſſed the ſtraits of Gades, now Gibraltar, and landed near the mouth of the river Bætis. Here he met with ſome ſeamen newly arrived from the Atlantic or Fortunate iſlands; and was ſo charmed with the account which they gave him of thoſe happy regions, that he reſolved to retire thither to ſpend the reſt of his life in quiet and happineſs. But having communicated this deſign to the Cilician pirates, they immediately abandoned him, and ſet ſail for Africa, with an intention to aſſiſt one of the barbarous kings againſt his ſubjects who had rebelled. Upon this Sertorius ſailed thither alſo, but took the oppoſite ſide; and having defeated the king named *Aſcalis*, obliged him to ſhut himſelf up in the city of Tingis, now Tangier, which he cloſely beſieged. But in the mean time Pacianus, who had been ſent by Sylla to aſſiſt the king, advanced with a conſiderable army againſt Sertorius. Upon this the latter, leaving part of his forces before the city, marched with the reſt to meet Pacianus, whoſe army, though greatly ſuperior to his own in number, he entirely defeated; killed the general, and took all his forces priſoners.—The fame of this victory ſoon reached Spain; and the Luſitanians, being threatened with a new war from Annius, invited Sertorius to head their armies. With this requeſt he very readily complied, and ſoon became very formidable to the Romans. Titus Didius, governor of that part of Spain called *Bætica*, firſt entered the liſts with him; but he being defeated, Sylla next diſpatched Metellus, reckoned one of the beſt commanders in Rome, to ſtop the progreſs of this new enemy. But Metellus, notwithſtanding all his experience, knew not how to act againſt Sertorius, who was continually changing his ſtation, putting his army into new forms, and contriving new ſtratagems. On his firſt arrival he ſent for L. Domitius, then prætor of Hither Spain, to his aſſiſtance; but Sertorius being informed of his march, detached Hirtuleius, or Herculeius, his quæſtor, againſt him, who gave him a total overthrow. Metellus then diſpatched Lucius Lollius prætor of Narbonne Gaul againſt Hirtuleius; but he met with no better ſucceſs, being utterly defeated, and his lieutenant-general killed.

31
Lands in Africa, and carries on a ſucceſsful war in that country.

32
Returns to Spain, and defeats the Romans there.

33
Erects Luſitania into a republic.

The fame of theſe victories brought to the camp of Sertorius ſuch a number of illuſtrious Roman citizens of the Marian faction, that he formed a deſign of erecting Luſitania into a republic in oppoſition to that of Rome. Sylla was continually ſending freſh ſupplies to Metellus; but Sertorius with a handful of men, accuſtomed to range about the mountains, to endure hunger and thirſt, and live expoſed to the inclemencies of the weather, ſo haraſſed the Roman army, that Metellus himſelf began to be quite diſcouraged. At laſt, Sertorius hearing that Metellus had ſpoken diſreſpectfully of his courage, challenged his antagoniſt to end the war by ſingle combat; but Metellus very prudently declined the combat, as being advanced in years; yet this refuſal brought upon him the contempt of the unthinking multitude, upon which Metellus reſolved to retrieve his reputation by ſome ſignal exploit, and therefore laid ſiege to Lacobriga, a conſiderable city in thoſe parts. This he hoped to reduce in two days, as there was but one well in the place; but Sertorius having previouſly removed all thoſe who could be of no ſervice during the ſiege, and conveyed 6000 ſkins full of water into the city, Metellus continued a long time before it without making any impreſſion. At laſt, his proviſions being almoſt ſpent, he ſent out Aquinus at the head of 6000 men to procure a new ſupply; but Sertorius falling unexpectedly upon them, cut in pieces or took the whole detachment; the commander himſelf being the only man who eſcaped to carry the news of the diſaſter; upon which Metellus was obliged to raiſe the ſiege with diſgrace.

34
Obliges Metellus to raiſe the ſiege of Lacobriga.

35
Civilizes the Luſitanians.

And now Sertorius, having gained ſome intervals of eaſe in conſequence of the many advantages he had obtained over the Romans, began to civilize his new ſubjects. Their ſavage and furious manner of fighting he changed for the regular order and diſcipline of a well-formed army; he beſtowed liberally upon them gold and ſilver to adorn their arms, and by converſing familiarly with them, prevailed with them to lay aſide their own dreſs for the Roman *toga*. He ſent for all the children of the principal people, and placed them in the great city of Oſca, now Hueſca, in the kingdom of Aragon, where he appointed them maſters to inſtruct them in the Roman and Greek learning, that they might, as he pretended, be capable of ſharing with him the government of the republic. Thus he made them really hoſtages for the good behaviour of their parents; however, the latter were greatly pleaſed with the care he took of their children, and all Luſitania were in the higheſt degree attached to their new ſovereign. This attachment he took care to heighten by the power of ſuperſtition; for having procured a young hind of a milk-white colour, he made it ſo tame that it followed him wherever he went; and Sertorius gave out to the ignorant multitude, that this hind was inſpired by Diana, and revealed to him the deſigns of his enemies, of which he always took care to be well informed by the great numbers of ſpies whom he employed.

36
Pompey the Great ſent againſt him.

While Sertorius was thus employed in eſtabliſhing his authority, the republic of Rome, alarmed at his ſucceſs, reſolved to cruſh him at all events. Sylla was now dead, and all the eminent generals in Rome ſolicited this honourable though dangerous employment. After much debate a decree was paſſed in favour of Pompey the Great, but without recalling Metellus. In the mean time, the troops of one Perpenna, or Perperna, had, in ſpite of all that their general could do, abandoned him, and taken the oath of allegiance to Sertorius. This was a moſt ſignal advantage to Sertorius; for Perpenna commanded an army of 33,000 men, and had come into Spain with a deſign to ſettle there as Sertorius had done; but as he was deſcended from one of the firſt families of Rome, he thought it below his dignity to ſerve under any general, however eminent he might be. But the troops of Perperna were of a different opinion; and therefore declaring that they would

ſerve

Spain.

serve none but a general who could defend himself, they to a man joined Sertorius; upon which Perperna himself finding he could do no better, consented to serve also as a subaltern.

37 Sertorius besieges Lauron.

On the arrival of Pompey in Spain, several of the cities which had hitherto continued faithful to Sertorius began to waver; upon which the latter resolved, by some signal exploit, to convince them that Pompey could no more screen them from his resentment than Metellus. With this view he laid siege to Lauron, now Lirias, a place of considerable strength. Pompey, not doubting but he should be able to raise the siege, marched quite up to the enemy's lines, and found means to inform the garrison that those who besieged them were themselves besieged, and would soon be obliged to retire with loss and disgrace. On hearing this message, "I will teach Sylla's disciple (said Sertorius), that it is the duty of a general to look behind as well as before him." Having thus spoken, he sent orders to a detachment of 6000 men, who lay concealed among the mountains, to come down and fall upon his rear if he should offer to force the lines. Pompey, surprised at their sudden appearance, durst not stir out of his camp; and in the mean time the besieged, despairing of relief, surrendered at discretion; upon which Sertorius granted them their lives and liberty, but reduced their city to ashes.

38 Takes and burns it in the sight of Pompey.

39 Defeats Pompey on the banks of the Sucro.

While Sertorius was thus successfully contending with Pompey, his questor Hirtuleius was entirely defeated by Metellus, with the loss of 40,000 men; upon which Sertorius advanced with the utmost expedition to the banks of the Sucro in Tarraconian Spain, with a design to attack Pompey before he could be joined by Metellus. Pompey, on his part, did not decline the combat; but, fearing that Metellus might share the glory of the victory, advanced with the greatest expedition. Sertorius put off the battle till towards the evening; Pompey, though he knew that the night would prove disadvantageous to him, whether vanquished or victorious, because his troops were unacquainted with the country, resolved to venture an engagement, especially as he feared that Metellus might arrive in the mean time, and rob him of part of the glory of conquering so great a commander. Pompey, who commanded his own right wing, soon obliged Perperna, who commanded Sertorius's left, to give way. Hereupon Sertorius himself, taking upon him the command of that wing, brought back the fugitives to the charge, and obliged Pompey to fly in his turn. In his flight he was overtaken by a gigantic African, who had already lifted up his hand to discharge a blow at him with his broad sword; but Pompey prevented him by cutting off his right hand at one blow. As he still continued his flight, he was wounded and thrown from his horse; so that he would certainly have been taken prisoner, had not the Africans who pursued him quarrelled about the rich furniture of his horse. This gave an opportunity to the general to make his escape; so that at length he reached his camp with much difficulty. But in the mean time Afranius, who commanded the left wing of the Roman army, had entirely defeated the wing which Sertorius had left, and even pursued them so close that he entered the camp along with them. Sertorius, returning suddenly, found the Romans busy in plundering the tents; when taking advantage of their situation, he drove them out with great slaughter, and retook their camp. Next day he offered battle a second time to Pompey; but Metellus then coming up with all his forces, he thought proper to decline an engagement with both commanders. In a few days, however, Pompey and Metellus agreed to attack the camp of Sertorius. The event was similar to that of the former battle; Metellus defeated Perperna, and Sertorius routed Pompey. Being then informed of Perperna's misfortune, he hastened to his relief; rallied the fugitives, and repulsed Metellus in his turn, wounded him with his lance, and would certainly have killed him, had not the Romans, ashamed to leave their general in distress, hastened to his assistance, and renewed the fight with great fury. At last Sertorius was obliged to quit the field, and retire to the mountains. Pompey and Metellus hastened to besiege him; but while they were forming their camp, Sertorius broke through their lines, and escaped into Lusitania. Here he soon raised such a powerful army, that the Roman generals, with their united forces, did not think proper to venture an engagement with him. They could not, however, resist the perpetual attacks of Sertorius, who now drove them from place to place, till he obliged them to separate; the one went into Gaul, and the other to the foot of the Pyrenees.

40 Pompey defeated a second time.

41 Pompey and Metellus driven from Spain by Sertorius.

42 Sertorius treacherously murdered.

Ant. Ch. B. [illegible]

Thus did this celebrated commander triumph over all the power of the Romans; and there is little doubt but he would have continued to make head against all the other generals whom the republic could have sent, had he not been assassinated at an entertainment by the infamous treachery of Perperna, in 73 B. C. after he had made head against the Roman forces for almost 10 years. Pompey was no sooner informed of his death, than, without waiting for any new succours, he marched against the traitor, whom he easily defeated and took prisoner; and having caused him to be executed, thus put an end, with very little glory, to a most dangerous war.

Many of the Spanish nations, however, still continued to bear the Roman yoke with great impatience; and as the civil wars which took place first between Julius Cæsar and Pompey, and afterwards between Octavianus and Antony, diverted the attention of the republic from Spain, by the time that Augustus had become sole master of the Roman empire, they were again in a condition to assert their liberty. The CANTABRIANS and ASTURIANS were the most powerful and valiant nations at that time in Spain; but, after incredible efforts, they were obliged to lay down their arms, or rather were almost exterminated by Agrippa, as related under these articles.

43 Spain under the Romans.

When the Romans first became masters of the western peninsula of Europe, to which, as we have said, they gave the name of Hispania, it was divided into two provinces, called *Citerior* and *Ulterior*, which were governed, sometimes by prætors, and sometimes by proconsuls. In the distribution of the empire by Augustus, *Hispania Citerior* contained the modern provinces of Gallicia, the Asturias, Biscay, Navarre, Leon, the two Castiles, Arragon, Catalonia, Murcia, and Valencia; and was denominated *Provincia Tarraconensis*, from the city of Tarragona in Catalonia, which was then the seat of government. *Hispania Ulterior* was subdivided into Bætica, including the provinces now called Granada and Andalufia; and Lufitania, comprehending the greateft part of Eftremadura, and the modern kingdom of Portugal. The province called *Tarraconenfis* was then inhabited by the following tribes, viz. the *Aufetani*, occupying the fea coaft, at the north-eaft, between the Ter and the Lobregat, and having for their capital Germa; the *Ceretani*, inhabiting the diftrict of Cerdana, at the foot of the Pyrenees, whofe capital was *Julia*, the modern Llivia; the *Valetani*, occupying the fea coaft between the rivers Ter and Lobregat, in the immediate neighbourhood of the *Aufetani*, and whofe capital was Barcelona; the *Cofetani* to the left of the mouth of the Ebro, with Tarragona for their capital; the *Locetani*, on the left bank of the river *Sicoris*; the *Illergetes*, extending from that river to the fmall ftream Gallego, which joins the Ebro near Zaragoza, whofe capital was Lerida; the *Jacetani* in the northern extremity of Aragon, having their feat of government at Jaca; the *Vafcones* in Navarre, and the *Varduii* in the modern Guipuzcoa. Thefe nations occupied the fouthern and eaftern parts of the province. The northern was poffeffed by the *Carifti*, the *Oftregones*, both in Bifcay; the *Cantabri*, cantoned near the fource of the Ebro, and along the bay of Bifcay; the *Aftures* in Afturias and part of Leon; the *Callæci* in Gallicia; the *Vacceni* along the Douro; the *Arebaci* in Old Caftile; the *Celtiberi*, between the Ebro and the fource of the Tagus, and many others of inferior note.

Lufitania was held by three principal tribes, the *Lufitani*, occupying the greater part of the province, and having for their capital the modern Lifbon; the *Vettones* and the *Celtici*.

Bætica was inhabited by the *Turdetani*, the *Turduli*, the *Baftitani*, and the *Bafluli*.

All thefe diftricts, with their principal towns, are minutely treated of by Dr Playfair, in the firft volume of his geography.

44
State of Roman Spain.

When incorporated with the Roman empire, Spain partook of its tranquillity, and received in exchange for her liberty, at leaft wife laws and a mild government. If fhe could not prevent herfelf from falling under the dominion of the mafters of the world, fhe was at leaft the moft powerful, the richeft, and the happieft province of their empire. Columella has left us an interefting account of her agriculture under the firft emperors. The tradition of her ancient population is probably exaggerated, but the ruins of feveral towns prove it to have been confiderable. It was increafed by a great many Roman families after the conqueft; feveral legions were eftablifhed in Spain; 25 colonies were diftributed in the moft fertile parts of the country, and intermarried with the inhabitants. After a while the Spaniards, feeing in their mafters only countrymen, were the firft to folicit the rights of Roman citizens, by which they were completely confolidated. Some municipal towns went fo far as to defire permiffion to take the title of colonies, though in the change they loft their independence, nearly in the fame manner as certain proprietors of lands under the feudal fyftem converted their domains into fiefs, in order to enjoy the honours attached to them. The government was, in general, milder in Spain than in the other Roman provinces. The adminiftration was carried on in the towns by magiftrates named by themfelves, and the different provinces were under the fuperintendance of pretors, proconfuls, and legates or deputies, according to the different eras of the Roman empire; thofe in their refpective departments took care of all the works of public utility, the aqueducts, baths, circufes, and highways, whofe magnificent ruins are ftill exifting; but they were principally employed in collecting the revenues of the ftate, which were fingularly analogous to thofe of the prefent times. They principally arofe from dues, fines, or alienations of property, and the produce of the mines. Spain at that time drew from her own mines the fame riches the now draws from the new world, and they were diftributed in nearly the fame manner. One part belonged to the ftate, and the other to the inhabitants of the country, who paid a certain duty on the metals which they procured from the mines. Their returns went on increafing, and depended entirely on the number of hands which could be devoted to work in the mines. An employment, fo laborious, however, which required a numerous population, tended to diminifh that population by the exceffive fatigues which it occafioned. Agriculture alfo fuffered by the accumulation of eftates in the hands of a few wealthy landholders. By the little attention paid to it by the proprietors, and by the defects infeparable from the fyftem of cultivation by means of flaves, commerce and induftry languifhed; and Spain, after having fhared in the fplendor of the Roman empire, was beginning to participate in its decline, when a new calamity, by completing her ruin, prepared her regeneration.

This calamity was the irruption of the northern hordes, which foon involved Spain in the general attack. This province was invaded firft by the Franks, who in the third century had entered Gaul with a formidable force.

45
Spain invaded by the Franks.
A. D. 260.

The Rhine, though dignified by the title of Safeguard of the Provinces, was an imperfect barrier againft the daring fpirit of enterprife with which the Franks were actuated. Their rapid devaftations ftretched from the river to the foot of the Pyrenees; nor were they ftopped by thofe mountains. Spain, which had never dreaded, was unable to refift the inroads of the Germans. During 12 years, the greateft part of the reign of Gallienus, that opulent country was the theatre of unequal and deftructive hoftilities. Tarragona, the flourifhing capital of a peaceful province, was facked and almoft deftroyed; and fo late as the days of Orofius, who wrote in the 5th century, wretched cottages, fcattered amidft the ruins of magnificent cities, ftill recorded the rage of the barbarians. When the exhaufted country no longer fupplied a variety of plunder, the Franks feized on fome veffels, and retreated to Mauritania.

46
By the Suevi, Vandals, &c.
An. 409.

The fituation of Spain, feparated, on all fides, from the enemies of Rome, by the fea, by the mountains, and by intermediate provinces, had fecured the long tranquillity of that remote and fequeftered country; and we may obferve, as a fure fymptom of domeftic happinefs, that, in a period of 400 years, Spain furnifhed very few materials to the hiftory of the Roman empire. The footfteps of the Barbarians, who, in the reign of Gallienus, had penetrated beyond the Pyrenees, were foon obliterated by the return of peace; and in the 4th century of the Chriftian era, the cities of Emerita or Merida, of Corduba, Seville, Bracara, and Tarragona, were numbered with the moft illuftrious of the Roman world.

The

The various plenty of the animal, the vegetable, and the mineral kingdoms, was improved and manufactured by the skill of an industrious people; and the peculiar advantages of naval stores contributed to support an extensive and profitable trade. The arts and sciences flourished under the protection of the emperors; and if the character of the Spaniards was enfeebled by peace and servitude, the hostile approach of the Germans, who had spread terror and desolation from the Rhine to the Pyrenees, seemed to rekindle some sparks of military ardour. As long as the defence of the mountains was intrusted to the hardy and faithful militia of the country, they successfully repelled the frequent attempts of the Barbarians. But no sooner had the national troops been compelled to resign their post to the Honorian bands, in the service of Constantine, than the gates of Spain were treacherously betrayed to the public enemy, about ten months before the sack of Rome by the Goths. The consciousness of guilt, and the thirst of rapine, prompted the mercenary guards of the Pyrenees to desert their station; to invite the arms of the Suevi, the Vandals, and the Alani; and to swell the torrent which was poured with irresistible violence from the frontiers of Gaul to the sea of Africa. The misfortunes of Spain may be described in the language of its most eloquent historian, who has concisely expressed the passionate, and perhaps exaggerated, declamations of contemporary writers. "The irruption of these nations was followed by the most dreadful calamities; as the Barbarians exercised their indiscriminate cruelty on the fortunes of the Romans and the Spaniards; and ravaged with equal fury the cities and the open country. The progress of famine reduced the miserable inhabitants to feed on the flesh of their fellow creatures; and even the wild beasts, who multiplied, without controul, in the desert, were exasperated, by the taste of blood, and the impatience of hunger, boldly to attack and devour their human prey. Pestilence soon appeared, the inseparable companion of famine; a large proportion of the people was swept away; and the groans of the dying excited only the envy of their surviving friends. At length the Barbarians, satiated with carnage and rapine, and afflicted by the contagious evil which they themselves had introduced, fixed their permanent seats in the depopulated country. The ancient Gallicia, whose limits included the kingdom of Old Castile, was divided between the Suevi and the Vandals, the Alani were scattered over the provinces of Carthagena and Lusitania, and from the Mediterranean to the Atlantic ocean; and the fruitful territory of Bætica was allotted to the Silingi, another branch of the Vandalic nation. After regulating this partition, the conquerors contracted with their new subjects some reciprocal engagements of protection and obedience: the lands were again cultivated; and the towns and villages were again occupied by a captive people. The greatest part of the Spaniards was even disposed to prefer this new condition of poverty and barbarism, to the severe oppressions of the Roman government; yet there were many who still asserted their native freedom, and who refused, more especially in the mountains of Gallicia, to submit to the barbarian yoke *."

* Mariana de reb. Hisp. par. 1. 5. v.

An. 414. The important present of the heads of Jovinus and Sebastian, had approved the friendship of Adolphus, and restored Gaul to the obedience of his brother Honorius. Peace was incompatible with the situation and temper of the king of the Goths. He readily accepted the proposal of turning his victorious arms against the barbarians of Spain; the troops of Constantius intercepted his communication with the sea-ports of Gaul, and gently pressed his march towards the Pyrenees. He passed the mountains, and surprised, in the name of the emperor, the city of Barcelona. The fondness of Adolphus for his Roman bride, Placidia, was not abated by time or possession; and the birth of a son, surnamed, from his illustrious grandsire, Theodosius, appeared to fix him for ever in the interest of the republic. The loss of that infant, whose remains were deposited in a silver coffin in one of the churches near Barcelona, afflicted his parents; but the grief of the Gothic king was suspended by the labours of the field: and the course of his victories was soon interrupted by domestic treason. He had imprudently received into his service one of the followers of Sarus; a barbarian of a daring spirit, but of a diminutive stature; whose secret desire of revenging the death of his beloved patron, was continually irritated by the sarcasms of his insolent master. Adolphus was An. 415. assassinated in the palace of Barcelona; the laws of the succession were violated by a tumultuous faction; and a stranger to the royal race, Singeric, the brother of Sarus himself, was seated on the Gothic throne. The first act of his reign was the inhuman murder of the six children of Adolphus, the issue of a former marriage, whom he tore, without pity, from the feeble arms of a venerable bishop. The unfortunate Placidia, instead of the respectful compassion, which she might have excited in the most savage breasts, was treated with cruel and wanton insult. The daughter of the emperor Theodosius, confounded among a crowd of vulgar captives, was compelled to march on foot above 12 miles, before the horse of a barbarian, the assassin of a husband whom Placidia loved and lamented.

But Placidia soon obtained the pleasure of revenge; 47 and the view of her ignominious sufferings might rouse Conquered by the an indignant people against the tyrant, who was assassi- Goths. nated on the seventh day of his usurpation. After the An. 415 death of Singeric, the free choice of the nation bestowed —418. the Gothic sceptre on Wallia, whose warlike and ambitious temper appeared, in the beginning of his reign, extremely hostile to the republic. He marched, in arms, from Barcelona to the shores of the Atlantic ocean, which the ancients revered and dreaded as the boundary of the world. But when he reached the southern promontory of Spain, and, from the rock now covered by the fortress of Gibraltar, contemplated the neighbouring and fertile coast of Africa, Wallia resumed the designs of conquest, which had been interrupted by the death of Alaric. The winds and waves disappointed the enterprises of the Goths; and the minds of a superstitious people were deeply affected by the repeated disasters of storms and shipwrecks. In this disposition, the successor of Adolphus no longer refused to listen to a Roman ambassador, whose proposals were enforced by the real, or supposed, approach of a numerous army, under the conduct of the brave Constantius. A solemn treaty was stipulated and observed: Placidia was honourably restored to her brother; 600,000 measures of wheat were delivered to the hungry Goths; and Wallia engaged to draw his sword in the service of the empire. A bloody war was instantly excited among the barbarians of Spain; and the contending princes are said to have

Spain.

have addreffed their letters, their ambaffadors, and their hoftages, to the throne of the weftern emperor, exhorting him to remain a tranquil fpectator of their conteft; the events of which muft be favourable to the Romans, by the mutual flaughter of their common enemies. The Spanifh war was obftinately fupported, during three campaigns, with defperate valour, and various fuccefs; and the martial achievements of Wallia diffufed through the empire the fuperior renown of the Gothic hero. He exterminated the Silingi, who had irretrievably ruined the elegant plenty of the province of Bætica. He flew in battle the king of the Alani; and the remains of thofe Scythian wanderers, who efcaped from the field, inftead of choofing a new leader, humbly fought a refuge under the ftandard of the Vandals, with whom they were ever afterwards confounded. The Vandals themfelves, and the Suevi, yielded to the efforts of the invincible Goths. The promifcuous multitude of barbarians, whofe retreat had been intercepted, were driven into the mountains of Gallicia, where they ftill continued, in a narrow compafs, and on a barren foil, to exercife their domeftic and implacable hoftilities. In the pride of victory, Wallia was faithful to his engagements; he reftored his Spanifh conquefts to the obedience of Honorius; and the tyranny of the imperial officers foon reduced an oppreffed people to regret the time of their barbarian fervitude. While the event of the war was ftill doubtful, the firft advantages obtained by the arms of Wallia, had encouraged the court of Ravenna to decree the honours of a triumph to their feeble fovereign. He entered Rome like the ancient conquerors of nations; and if the monuments of fervile corruption had not long fince met with the fate which they deferved, we fhould probably find that a crowd of poets, and orators, of magiftrates and bifhops, applauded the fortune, the wifdom, and the invincible courage, of the emperor Honorius.

An. 42[illegible]. After the retreat of the Goths, the authority of Honorius had obtained a precarious eftablifhment in Spain; except only in the province of Gallicia, where the Suevi and the Vandals had fortified their camps, in mutual difcord, and hoftile independence. The Vandals prevailed; and their adverfaries were befieged in the Nervafcan hills, between Leon and Oviedo, till the approach of Count Afterius compelled, or rather provoked, the victorious barbarians to remove the fcene of the war to the plains of Bætica. The rapid progrefs of the Vandals foon required a more effectual oppofition; and the mafter-general Coftinus marched againft them with a numerous army of Romans and Goths. Vanquifhed in battle by an inferior enemy, Coftinus fled with difhonour to Tarragona; and this memorable defeat, which has been reprefented as the punifhment, was moft probably the effect, of his rafh prefumption. Seville and Carthagena became the reward, or rather the prey, of the ferocious conquerors; and the veffels which they found in the harbour of Carthagena, might eafily tranfport them to the ifles of Majorca and Minorca, where the Spanifh fugitives, as in a fecure recefs, had vainly concealed their families and their fortunes. The experience of navigation, and perhaps the profpect of Africa, encouraged the Vandals to accept the invitation which they received from Count Boniface; and the death of Gonderic ferved only to forward and animate the bold enterprife. In the room of a prince, not confpicuous for any fuperior powers of the mind or body, they acquired his baftard brother, the terrible Genferic; a name which, in the deftruction of the Roman empire, has deferved an equal rank with the names of Alaric and Attila. Almoft in the moment of his departure he was informed, that Hermanric, king of the Suevi, had prefumed to ravage the Spanifh territories, which he was refolved to abandon. Impatient of the infult, Genferic purfued the hafty retreat of the Suevi as far as Merida; precipitated the king and his army into the river Anas, and calmly returned to the fea fhore, to embark his victorious troops. The veffels which tranfported the Vandals over the modern ftraits of Gibraltar, a channel only twelve miles in breadth, were furnifhed by the Spaniards, who anxioufly wifhed their departure; and by the African general, who had implored their formidable affiftance.

An. 456. When Theodoric king of the Vifigoths encouraged Avitus to affume the purple, he offered his perfon and his forces, as a faithful foldier of the republic. The exploits of Theodoric foon convinced the world, that he had not degenerated from the warlike virtues of his anceftors. After the eftablifhment of the Goths in Aquitain, and the paffage of the Vandals into Africa, the Suevi, who had fixed their kingdom in Gallicia, afpired to the conqueft of Spain, and threatened to extinguifh the feeble remains of the Roman dominion. The provincials of Carthagena and Tarragona, afflicted by an hoftile invafion, reprefented their injuries and their apprehenfions. Count Fronto was difpatched, in the name of the emperor Avitus, with advantageous offers of peace and alliance; and Theodoric interpofed his weighty mediation, to declare that, unlefs his brother-in-law, the king of the Suevi, immediately retired, he fhould be obliged to arm in the caufe of juftice and of Rome. "Tell him," replied the haughty Rechiarius, "that I defpife his friendfhip and his arms; but that I fhall foon try, whether he will dare to expect my arrival under the walls of Thouloufe." Such a challenge urged Theodoric to prevent the bold defigns of his enemy: He paffed the Pyrenees at the head of the Vifigoths; the Franks and Burgundians ferved under his ftandard; and though he profeffed himfelf the dutiful fervant of Avitus, he privately ftipulated, for himfelf and his fucceffors, the abfolute poffeffion of his Spanifh conquefts. The two armies, or rather the two nations, encountered each other on the banks of the river Urbicus, about 12 miles from Aftorga; and the decifive victory of the Goths appeared for a while to have extirpated the name and kingdom of the Suevi. From the field of battle Theodoric advanced to Braga, their metropolis, which ftill retained the fplendid veftiges of its ancient commerce and dignity. His entrance was not polluted with blood, and the Goths refpected the chaftity of their female captives, more efpecially of the confecrated virgins; but the greateft part of the clergy and people were made flaves, and even the churches and altars were confounded in the univerfal pillage. The unfortunate king of the Suevi had efcaped to one of the ports of the ocean; but the obftinacy of the winds oppofed his flight; he was delivered to his implacable rival; and Rechiarius, who neither defired nor expected mercy, received, with manly conftancy, the death which he would probably have inflicted. After this bloody facrifice to policy or refentment, Theodoric carried his victorious

Spain.

victorious arms as far as Merida, the principal town of Luſitania, without meeting any reſiſtance, except from the miraculous powers of St Eulalia; but he was ſtopped in the full career of ſucceſs, and recalled from Spain, before he could provide for the ſecurity of his conqueſts. In his retreat towards the Pyrenees, he revenged his diſappointment on the country through which he paſſed; and in the ſack of Pallentia and Aſtorga, he ſhewed himſelf a faithleſs ally, as well as a cruel enemy.

45 Introduction of Chriſtianity. AD 586.—589.

Recared was the firſt Catholic king of Spain. He had imbibed the faith of his unfortunate brother, and he ſupported it with more prudence and ſucceſs. Inſtead of revolting againſt his father, Recared patiently expected the hour of his death. Inſtead of condemning his memory, he piouſly ſuppoſed, that the dying monarch had abjured the errors of Arianiſm, and recommended to his ſon the converſion of the Gothic nation. To accompliſh that ſalutary end, Recared convened an aſſembly of the Arian clergy and nobles, declared himſelf a Catholic, and exhorted them to imitate the example of their prince. The laborious interpretation of doubtful texts, or the curious purſuit of metaphyſical arguments, would have excited endleſs controverſy; and the monarch diſcreetly propoſed to his illiterate audience, two ſubſtantial and viſible arguments, the teſtimony of Earth and of Heaven. The *Earth* had ſubmitted to the Nicene ſynod: the Romans, the Barbarians, and the inhabitants of Spain, unanimouſly profeſſed the ſame orthodox creed; and the Viſigoths reſiſted, almoſt alone, the conſent of the Chriſtian world. A ſuperſtitious age was prepared to reverence, as the teſtimony of *Heaven*, the preternatural cures which were performed by the ſkill or virtue of the Catholic clergy; the baptiſmal fonts of Oſſet in Bætica, which were ſpontaneouſly repleniſhed each year, on the vigil of Eaſter; and the miraculous ſhrine of St Martin of Tours, which had already converted the Suevic prince and people of Gallicia. The Catholic king encountered ſome difficulties on this important change of the national religion. A conſpiracy, ſecretly fomented by the queen-dowager, was formed againſt his life; and two counts excited a dangerous revolt in the Narbonneſe Gaul. But Recared diſarmed the conſpirators, defeated the rebels, and executed ſevere juſtice; which the Arians, in their turn, might brand with the reproach of perſecution. Eight biſhops, whoſe names betray their Barbaric origin, abjured their errors; and all the books of Arian theology were reduced to aſhes, with the houſe in which they had been purpoſely collected. The whole body of the Viſigoths and Suevi were allured or driven into the pale of the Catholic communion; the faith, at leaſt, of the riſing generation, was fervent and ſincere; and the devout liberality of the Barbarians enriched the churches and monaſteries of Spain. Seventy biſhops aſſembled in the council of Toledo, received the ſubmiſſion of their conquerors; and the zeal of the Spaniards improved the Nicene creed, by declaring the proceſſion of the Holy Ghoſt from the Son, as well as from the Father; a weighty point of doctrine, which produced, long afterwards, the ſchiſm of the Greek and Latin churches. The royal proſelyte immediately ſaluted and conſulted Pope Gregory, ſurnamed the Great, a learned and holy prelate, whoſe reign was diſtinguiſhed by the converſion of heretics and infidels. The ambaſſadors of Recared reſpectfully offered on the threſhold of the Vatican his rich preſents of gold and gems: they accepted, as a lucrative exchange, the hairs of St John the Baptiſt; a croſs, which incloſed a ſmall piece of the true wood; and a key, that contained ſome particles of iron which had been ſcraped from the chains of St Peter*.

* Gibbon's Rome, 4to vol. iii. p. 549.

49 Legiſlative aſſemblies of the Goths in Spain.

After their converſion from idolatry or hereſy, the Franks and the Viſigoths were diſpoſed to embrace, with equal ſubmiſſion, the inherent evils, and the accidental benefits of ſuperſtition. But the prelates of France, long before the extinction of the Merovingian race, had degenerated into fighting and hunting barbarians. They diſdained the uſe of ſynods; forgot the laws of temperance and chaſtity, and preferred the indulgence of private ambition and luxury, to the greateſt intereſt of the ſacerdotal profeſſion. The biſhops of Spain reſpected themſelves, and were reſpected by the public: their indiſſoluble union diſguiſed their vices, and confirmed their authority; and the regular diſcipline of the church introduced peace, order, and ſtability into the government of the ſtate. From the reign of Recared, the firſt Catholic king, to that of Witiza, the immediate predeceſſor of the unfortunate Roderic, ſixteen national councils were ſucceſſively convened. The ſix metropolitans, Toledo, Seville, Merida, Braga, Tarragona and Narbonne, preſided according to their reſpective ſeniority; the aſſembly was compoſed of their ſuffragan biſhops, who appeared in perſon, or by their proxies; and a place was aſſigned to the moſt holy, or opulent, of the Spaniſh abbots. During the firſt three days of the convocation, as long as they agitated the eccleſiaſtical queſtions of doctrine and diſcipline, the profane laity was excluded from their debates; which were conducted, however, with decent ſolemnity. But, on the morning of the fourth day, the doors were thrown open for the entrance of the great officers of the palace, the dukes and counts of the provinces, the judges of the cities, and the Gothic nobles; and the decrees of Heaven were ratified by the conſent of the people. The ſame rules were obſerved in the provincial aſſemblies, the annual ſynods, which were empowered to hear complaints, and to redreſs grievances; and a legal government was ſupported by the prevailing influence of the Spaniſh clergy. The biſhops who, in each revolution, were prepared to flatter the victorious, and to inſult the proſtrate, laboured, with diligence and ſucceſs, to kindle the flames of perſecution, and to exalt the mitre above the crown. Yet the national councils of Toledo, in which the free ſpirit of the Barbarians was tempered, and guided by epiſcopal policy, have eſtabliſhed ſome prudent laws for the benefit of the king and people. The vacancy of the throne was ſupplied by the choice of the biſhops and palatines; and after the failure of the line of Alaric, the regal dignity was ſtill limited to the pure and noble blood of the Goths. The clergy, who anointed their lawful prince, always recommended, and ſometimes practiſed, the duty of allegiance; and the ſpiritual cenſures were denounced on the heads of the impious ſubjects, who ſhould reſiſt his authority, conſpire againſt his life, or violate, by an indecent union, the chaſtity even of his widow. But the monarch himſelf, when he aſcended the throne, was bound by a reciprocal oath to God and his people, that he would faithfully execute his important truſt. The real or imaginary faults of his adminiſtration were ſubject to the

the controul of a powerful ariſtocracy; and the biſhops and palatines were guarded by a fundamental privilege that they ſhould not be degraded, impriſoned, tortured, nor puniſhed with death, exile, or confiſcation, unleſs by the free and public judgement of their peers.

50 Code of the Viſigoths.

One of theſe legiſlative councils of Toledo, examined and ratified the code of laws which had been compiled by a ſucceſſion of Gothic kings, from the fierce Eurice, to the devout Egica. As long as the Viſigoths themſelves were ſatisfied with the rude cuſtoms of their anceſtors, they indulged their ſubjects of Aquitaine and Spain in the enjoyment of the Roman law. Their gradual improvement in arts, in policy, and at length in religion, encouraged them to imitate, and to ſuperſede, theſe foreign inſtitutions, and to compoſe a code of civil and criminal juriſprudence, for the uſe of a great and united people. The ſame obligations, and the ſame privileges, were communicated to the nations of the Spaniſh monarchy; and the conquerors, inſenſibly renouncing the Teutonic idiom, ſubmitted to the reſtraints of equity, and exalted the Romans to the participation of freedom. The merit of this impartial policy was enhanced by the ſituation of Spain, under the reign of the Viſigoths. The provincials were long ſeparated from their Arian maſters, by the irreconcileable difference of religion. After the converſion of Recared had removed the prejudices of the Catholics, the coaſts, both of the ocean and Mediterranean, were ſtill poſſeſſed by the Eaſtern emperors, who ſecretly excited a diſcontented people to reject the yoke of the barbarians, and to aſſert the name and dignity of Roman citizens. The allegiance of doubtful ſubjects is indeed moſt effectually ſecured by their own perſuaſion, that they hazard more in a revolt, than they can hope to obtain by a revolution; but it has appeared ſo natural to oppreſs thoſe whom we hate and fear, that the contrary ſyſtem well deſerves the praiſe of wiſdom and moderation.

The Gothic princes continued to reign over a conſiderable part of Spain till the beginning of the 8th century, when their empire was overthrown by the Saracens. During this period, they had entirely expelled the eaſtern emperors from what they poſſeſſed in Spain, and even made conſiderable conqueſts in Barbary; but towards the end of the 7th century the Saracens overran all that part of the world with a rapidity which nothing could reſiſt; and having ſoon poſſeſſed themſelves of the Gothic dominions in Barbary, they made a deſcent upon Spain about the year 711 or 712. The king of the Goths at that time was called *Roderic*, and by his bad conduct had occaſioned great diſaffection among his ſubjects. He therefore determined to put all to the iſſue of a battle, knowing that he could not depend upon the fidelity of his own people if he allowed the enemy time to tamper with them. The two armies met in a plain near Xeres in Andaluſia. The Goths began the attack with great fury; but though they fought like men in deſpair, they were at laſt defeated with exceſſive ſlaughter, and their king himſelf was ſuppoſed to have periſhed in the battle, being never more heard of.

51 The Gothic kingdom overthrown by the Saracens.

An. 711.

By this battle the Moors in a ſhort time rendered themſelves maſters of almoſt all Spain. The poor remains of the Goths were obliged to retire into the mountainous parts of Aſturias, Burgos, and Biſcay: the inhabitants of Aragon, Catalonia, and Navarre, though they might have made a conſiderable ſtand againſt the enemy, choſe for the moſt part to retire into France. In 718, however, the power of the Goths began again to revive under Don Pelagio or Pelayo, a prince of the royal blood, who headed thoſe that had retired to the mountains after the fatal battle of Xeres. The place where he firſt laid the foundation of his government was in the Aſturias, in the province of Liebana, about nine leagues in length and four in breadth. This is the moſt inland part of the country, full of mountains enormouſly high, and ſo much fortified by nature, that its inhabitants are capable of reſiſting almoſt any number of invaders. Alakor the Saracen governor was no ſooner informed of this revival of the Gothic kingdom, than he ſent a powerful army, under the command of one Alchaman, to cruſh Don Pelagio before he had time to eſtabliſh his power. The king, though his forces were ſufficiently numerous (every one of his ſubjects arrived at man's eſtate being a ſoldier), did not think proper to venture a general engagement in the open field; but taking poſt with part of them himſelf in a cavern in a very high mountain, he concealed the reſt among precipices, giving orders to them to fall upon the enemy as ſoon as they ſhould perceive him attacked by them. Theſe orders were punctually executed, though indeed Don Pelagio himſelf had repulſed his enemies, but not without a miracle, as the Spaniſh hiſtorians pretend. The ſlaughter was dreadful; for the troops who lay in ambuſcade joining the reſt, and rolling down huge ſtones from the mountains upon the Moors (the name by which the Saracens were known in Spain), no fewer than 124,000 of theſe unhappy people periſhed in one day. The remainder fled till they were ſtopped by a river, and beginning to coaſt it, part of a mountain ſuddenly fell down, ſtopped up the channel of the river, and either cruſhed or drowned, by the ſudden riſing of the water, almoſt every one of that vaſt army.

52 The power of the Goths revives under Pelagio.

An. 718.

53 He gives the Saracens a dreadful overthrow.

54 Another army cut in pieces or taken.

The Moors were not ſo much diſheartened by this diſaſter, but that they made a ſecond attempt againſt Don Pelagio. Their ſucceſs was as bad as ever, the greateſt part of their army being cut in pieces or taken; in conſequence of which, they loſt all the Aſturias, and never dared to enter the liſts with Pelagio afterwards. Indeed, their bad ſucceſs had in a great meaſure taken from them the deſire of conquering a country where little or nothing was to be gained; and therefore they rather directed their force againſt France, where they hoped for more plunder. Into this country they poured in prodigious multitudes; but were utterly defeated, in 732, by Charles Martel, with the loſs of 300,000 men, as the hiſtorians of thoſe times pretend.

The ſubſequent hiſtory of Spain is rendered ſo confuſed by the numerous kingdoms that were eſtabliſhed either by the Chriſtians or the Moors, that ſome chronological guide is neceſſary to make it intelligible. Before purſuing the thread of the narration, we ſhall lay before our readers the following chronological table of the cotemporary monarchs from Pelagio to Ferdinand VII.

Chronological Table of the Kings of Spain.

Year.	Asturias and Leon.	Castile.	Aragon.	Navarre.	Saracens.

An. 737. Don Pelagio died in 737; and ſoon after his death ſuch inteſtine diviſions broke out among the Moors, as greatly favoured the increaſe of the Chriſtian power. In 745 Don Alonſo the Catholic, ſon-in-law to Pelagio, in conjunction with his brother Froila, paſſed the mountains, and fell upon the northern part of Gallicia; and meeting with little reſiſtance, he recovered almoſt the whole of that province in a ſingle campaign. Next year he invaded the plains of Leon and Caſtile; and before the Moors could aſſemble any force to oppoſe him, he reduced Aſtorgas, Leon, Saldagna, Montes de Oca, Amaya, Alava, and all the country at the foot of the mountains. The year following he puſhed his conqueſts as far as the borders of Portugal, and the next campaign ravaged the country as far as Caſtile. Being ſenſible, however, that he was yet unable to defend the flat country which he had conquered, he laid the whole of it waſte, obliged the Chriſtians to retire to the mountains, and carried off all the Moors for ſlaves. Thus ſecured by a deſert frontier, he met with no interruption for ſome years; during which time, as his kingdom advanced in ſtrength, he allowed his ſubjects gradually to occupy part of the flat country, and to rebuild Leon and Aſtorgas, which he had demoliſhed. He died in 758, and was ſucceeded by his ſon Don Froila. In his time Abdoulrahman, the khaliff's viceroy in Spain, threw off the yoke, and rendered himſelf independent, fixing the ſeat of his government at Cordova. Thus the inteſtine diviſions among the Moors were compoſed; yet their ſucceſs ſeems to have been little better than before; for, ſoon after, Froila encountered the Moors with ſuch ſucceſs, that 54,000 of them were killed on the ſpot, and their general taken priſoner. Soon after he built the city of Oviedo, which he made the

55 Conqueſts of the Chriſtians. An. 745.

56 The Saracens in Spain throw off the yoke of the khalifs. An. 758.

the capital of his dominions, in order to be in a better condition to defend the flat country, which he now determined to people.

57
Hiftory of the kingdom of Navarre.
An. 850.

In the year 850 the power of the Saracens received another blow by the rife of the kingdom of Navarre. This kingdom, we are told, took its origin from an accidental meeting of gentlemen, to the number of 600, at the tomb of an hermit named *John*, who had died among the Pyrenees. At this place, where they had met on account of the fuppofed fanctity of the deceafed, they took occafion to converfe on the cruelty of the Moors, the miferies to which the country was expofed, and the glory that would refult from throwing off their yoke; which, they fuppofed, might eafily be done, by reafon of the ftrength of their country. On mature deliberation, the project was approved; one Don Garcias Ximenes was appointed king, as being of illuftrious birth, and looked upon as a perfon of great abilities. He recovered Ainfa, one of the principal towns of the country, out of the hands of the infidels, and his fucceffor Don Garcias Inigas extended his territories as far as Bifcay; however, the Moors ftill poffeffed Portugal, Murcia, Andalufia, Valeneia, Granada, Tortofa, with the interior part of the country as far as the mountains of Caftile and Zaragoza. Their internal diffenfions, which revived after the death of Abdoulrahman, contributed greatly to reduce the power of the infidels in general.

58
Conquefts of Charles the Great.

In 778, Charles the Great being invited by fome difcontented Moorifh governors, entered Spain with two great armies; one paffing through Catalonia, and the other through Navarre, where he pufhed his conquefts as far as the Ebro. On his return he was attacked and defeated by the Moors; though this did not hinder him from keeping poffeffion of all thofe places he had already reduced. At this time he feems to have been mafter of Navarre: however, in 831 Count Azner, revolting from Pepin fon to the emperor Louis, afferted the independency of Navarre; but the fovereigns did not affume the title of kings till the time of Don Garcias, who began to reign in 857.

An. 921.

In the mean time, the kingdom founded by Don Pelagio, now called the kingdom of *Leon* and *Oviedo*, continued to increafe rapidly in ftrength, and many advantages were gained over the Moors, who having two enemies to contend with, loft ground every day. In 921, however, they gained a great victory over the united forces of Navarre and Leon, by which the whole force of the Chriftians in Spain muft have been entirely broken, had not the victors conducted their affairs fo wretchedly, that they fuffered themfelves to be almoft entirely cut in pieces by the remains of the Chriftian army. In fhort, the Chriftians became at length fo terrible to the Moors, that it is probable they could not long have kept their footing in Spain, had not a great general, named *Mohammed Ebn Amir Almanzor*, appeared, in 979, to fupport their finking caufe.

59
Exploits of Almanzor a Saracen general.
An. 979

This man was vifir to the king of Cordova, and being exceedingly provoked againft the Chriftians on account of what his countrymen had fuffered from them, made war with the moft implacable fury. He took the city of Leon, murdered the inhabitants, and reduced the houfes to afhes. Barcelona fhared the fame fate; Caftile was reduced to a defert; Galicia and Portugal ravaged; and he is faid to have overcome the Chriftians in fifty different engagements. At laft, having taken and demolifhed the city of Compoftella, and carried off in triumph the gates of the church of St James, a flux happened to break out among his troops, which the fuperftitious Chriftians fuppofed to be a divine judgement on account of his facrilege. Taking it for granted, therefore, that the Moors were now entirely deftitute of all heavenly aid, they fell upon them with fuch fury in the next engagement, that all the valour and conduct of Almanzor could not prevent a defeat. Overcome with fhame and defpair at this misfortune, he defired his followers to fhift for themfelves, while he himfelf retired to Medina Cœli, and put an end to his life by abftinence in the year 998.

60
He is defeated, and ftarves himfelf to death.
An. 998.

61
Rife of the kingdom of Caftile.
An. 1037.

During this period a new Chriftian principality appeared in Spain, namely that of Caftile, which is now divided into the Old and New Caftile. The Old Caftile was recovered long before that called the *New*. It was feparated from the kingdom of Leon on one fide by fome little rivers; on the other, it was bounded by the Afturias, Bifcay, and the province of Rioja. On the fouth it had the mountains of Segovia and Avila; thus lying in the middle between the Chriftian kingdom of Leon and Oviedo, and the Moorifh kingdom of Cordova. Hence this diftrict foon became an object of contention between the kings of Leon and thofe of Cordova; and as the former were generally victorious, fome of the principal Caftilian nobility retained their independence under the protection of the Chriftian kings, even when the power of the Moors was at its greateft height. In 884 we firft hear of Don Rodriguez affuming the title of *count of Caftile*, though it does not appear that either his territory or title were given him by the king of Leon. Neverthelefs, this monarch having taken upon him to punifh fome of the Caftilian lords as rebels, the inhabitants made a formal renunciation of their allegiance, and fet up a new kind of government. The fupreme power was now vefted in two perfons of quality ftyled *judges*; however, this method did not long continue to give fatisfaction, and the fovereignty was once more vefted in a fingle perfon. By degrees Caftile fell entirely under the power of the kings of Leon and Oviedo; and, in 1037, Don Sancho beftowed it on his eldeft fon Don Ferdinand, with the title of *king*; and thus the territories of Caftile were firft firmly united to thofe of Leon and Oviedo, and the fovereigns were thenceforth ftyled *kings of Leon and Caftile*.

62
Rife of Aragon.
An. 1035.

Befides all thefe, another Chriftian kingdom was fet up in Spain about the beginning of the 11th century. This was the kingdom of Aragon. The inhabitants were very brave, and lovers of liberty, fo that it is probable they had in fome degree maintained their independence, even when the power of the Moors was greateft. The hiftory of Aragon, however, during its infancy, is much lefs known than that of any of the others hitherto mentioned.

63
State of Spain in the beginning of the 11th century.

We are only affured, that about the year 1035, Don Sancho, furnamed the *Great*, king of Navarre, erected Aragon into a kingdom in favour of his fon Don Ramiro, and afterwards it became very powerful. At this time, then, we may imagine the continent of Spain divided into two unequal parts by a ftraight line drawn from eaft to weft, from the coafts of Valencia to a little below the mouth of the Douro. The country north of this belonged to the Chriftians, who, as yet, had the fmalleft and leaft valu-

able

Spain.

able ſhare, and all the reſt to the Moors. In point of wealth and real power, both by land and ſea, the Moors were much ſuperior; but their continual diſſenſions greatly weakened them, and every day facilitated the progreſs of the Chriſtians. Indeed, had either of the parties been united, the other muſt ſoon have yielded; for though the Chriſtians did not make war upon each other conſtantly as the Moors did, their mutual feuds were yet ſufficient to have ruined them, had their adverſaries made the proper uſe of the advantages thus afforded them. But among the Moors almoſt every city was a kingdom; and as theſe petty ſovereignties ſupported one another very indifferently, they fell a prey one after another to their enemies. In 1080, the king of Toledo was engaged in a war with the king of Seville, another Mooriſh potentate; which being obſerved by Alphonſo king of Caſtile, he alſo invaded his territories; and in four years made himſelf maſter of the city of Toledo, with all the places of importance in its neighbourhood; from thenceforth making Toledo the capital of his dominions. In a ſhort time the whole province of New Caſtile ſubmitted; and Madrid, the preſent capital of Spain, fell into the hands of the Chriſtians, being at that time but a ſmall place.

64 Toledo and Madrid taken by the Chriſtians. An. 1080.

The Moors were ſo much alarmed at theſe conqueſts, that they not only entered into a general confederacy againſt the Chriſtians, but invited to their aſſiſtance Mahomet Ben Joſeph the ſovereign of Barbary. He accordingly came, attended by an incredible multitude; but was utterly defeated by the Chriſtians in the defiles of the Black Mountain, or Sierra Morena, on the borders of Andaluſia. This victory happened on the 16th of July 1212, and the anniverſary is ſtill celebrated at Toledo. This victory was not improved; the Chriſtian army immediately diſperſed themſelves, while the Moors of Andaluſia were ſtrengthened by the remains of the African army; yet, inſtead of being taught, by their paſt misfortunes, to unite among themſelves, their diſſenſions became worſe than ever, and the conqueſts of the Chriſtians became daily more rapid. In 1236, Don Ferdinand of Caſtile and Leon took the celebrated city of Cordova, the reſidence of the firſt Mooriſh kings; at the ſame time that James I. of Aragon diſpoſſeſſed them of the iſland of Majorca, and drove them out of Valencia. Two years after, Ferdinand made himſelf maſter of Murcia, and took the city of Seville; and in 1303 Ferdinand IV reduced Gibraltar.

65 A ſignal victory gained over the Moors. An. 1212.

An. 1236.

66 England interferes in the Spaniſh affairs.

In the time of Edward III. we find England, for the firſt time, interfering in the affairs of Spain, on the following occaſion. In the year 1284 the kingdom of Navarre had been united to that of France by the marriage of Donna Joanna queen of Navarre with Philip the Fair of France. In 1328, however, the kingdoms were again ſeparated, though the ſovereigns of Navarre were ſtill related to thoſe of France. In 1350, Charles, ſurnamed the *Wicked*, aſcended the throne of Navarre, and married the daughter of John king of France. Notwithſtanding this alliance, and that he himſelf was related to the royal family of France, he ſecretly entered into a negociation with England againſt the French monarch, and even drew into his ſchemes the dauphin Charles, afterwards ſurnamed *the Wiſe*. The young prince, however, was ſoon after made fully ſenſible of the danger and folly of the connections into which he had entered; and, by way of atonement, promiſed to ſacrifice his aſſociates. Accordingly he invited the king of Navarre, and ſome of the principal nobility of the ſame party, to a feaſt at Rouen, where he betrayed them to his father. The moſt obnoxious were executed, and the king of Navarre was thrown into priſon. In this extremity, the party of the king of Navarre had recourſe to England. The prince of Wales, ſurnamed *the Black Prince*, invaded France, defeated King John at Poictiers, and took him priſoner *; which unfortunate event produced the moſt violent diſturbances in that kingdom. The dauphin, now about 19 years of age, naturally aſſumed the royal power during his father's captivity: but poſſeſſed neither experience nor authority ſufficient to remedy the prevailing evils. In order to obtain ſupplies, he aſſembled the ſtates of the kingdom: but that aſſembly, inſtead of ſupporting his adminiſtration, laid hold of the preſent opportunity to demand limitations of the prince's power, the puniſhment of paſt malverſations, and the liberty of the king of Navarre. Marcel, provoſt of the merchants of Paris, and firſt magiſtrate of that city, put himſelf at the head of the unruly populace, and puſhed them to commit the moſt criminal outrages againſt the royal authority. They detained the dauphin in a kind of captivity, murdered in his preſence Robert de Clermont and John de Conflans, mareſchals of France; threatened all the other miniſters with the like fate; and when Charles, who had been obliged to temporize and diſſemble, made his eſcape from their hands, they levied war againſt him, and openly rebelled. The other cities of the kingdom, in imitation of the capital, ſhook off the dauphin's authority, took the government into their own hands, and ſpread the contagion into every province,

67 The king of Navarre impriſoned by John king of France.

* See France, N° 44.

68 Eſcapes, and heads the French malecontents.

Amidſt theſe diſorders, the king of Navarre made his eſcape from priſon, and preſented a dangerous leader to the furious malecontents. He revived his pretenſions to the crown of France: but in all his operations he acted more like a leader of banditti than one who aſpired to be the head of a regular government, and who was engaged by his ſtation to endeavour the re-eſtabliſhment of order in the community. All the French, therefore, who wiſhed to reſtore peace to their country, turned their eyes towards the dauphin; who, though not remarkable for his military talents, daily gained by his prudence and vigilance the aſcendant over his enemies. Marcel, the ſeditious provoſt of Paris, was ſlain in attempting to deliver that city to the king of Navarre. The capital immediately returned to its duty: the moſt conſiderable bodies of the mutinous peaſants were diſperſed or put to the ſword; ſome bands of military robbers underwent the ſame fate; and France began once more to aſſume the appearance of civil government.

John was ſucceeded in the throne of France by his ſon Charles V a prince educated in the ſchool of adverſity, and well qualified, by his prudence and experience, to repair the loſſes which the kingdom had ſuſtained from the errors of his predeceſſors. Contrary to the practice of all the great princes of thoſe times, who held nothing in eſtimation but military courage, he ſeems to have laid it down as a maxim, never to appear at the head of his armies; and he was the firſt European monarch that ſhowed the advantage of policy and foreſight over a raſh and precipitate valour.

Before Charles could think of counterbalancing ſo great

Spain.

69 Is defeated and obliged to submit to the terms prescribed by Charles V. of France.

great a power as England, it was necessary for him to remedy the many disorders to which his own kingdom was exposed. He accordingly turned his arms against the king of Navarre, the great disturber of France during that age; and he defeated that prince, and reduced him to terms, by the valour and conduct of Bertrand du Guesclin, one of the most accomplished captains of those times, whom Charles had the discernment to choose as the instrument of his victories. He also settled the affairs of Britanny, by acknowledging the title of Mountfort, and receiving homage for his dominions. But much was yet to be done. On the conclusion of the peace of Bretigni, the many military adventurers who had followed the fortunes of Edward, being dispersed into the several provinces, and possessed of strong holds, refused to lay down their arms, or relinquish a course of life to which they were now accustomed, and by which alone they could earn a subsistence.

70 Account of the banditti called *companies* or *companions*.

They associated themselves with the banditti, who were already inured to the habits of rapine and violence; and, under the name of *companies* and *companions*, became a terror to all the peaceable inhabitants. Some English and Gascon gentlemen of character were not ashamed to take the command of these ruffians, whose number amounted to near 40,000, and who bore the appearance of regular armies rather than bands of robbers. As Charles was not able by power to redress so enormous a grievance, he was led by necessity, as well as by the turn of his character, to correct it by policy; to discover some method of discharging into foreign countries this dangerous and intestine evil; and an occasion now offered.

71 Reign of Pedro the Cruel, king of Castile.

Alphonso XI. king of Castile, who took the city of Algezira from the Moors, after a famous siege of two years, during which artillery are said first to have been used by the besieged, had been succeeded by his son Pedro I. surnamed *the Cruel*; a prince equally perfidious, debauched, and bloody. He began his reign with the murder of his father's mistress, Leonora de Gusman: his nobles fell every day the victims of his severity: he put to death his cousin and one of his natural brothers, from groundless jealousy; and he caused his queen Blanche de Bourbon, of the blood of France, to be thrown into prison, and afterwards poisoned, that he might enjoy in quiet the embraces of Mary de Padella, with whom he was violently enamoured.

72 The Companies employed against him.

Henry count of Trastamara, the king's natural brother, alarmed at the fate of his family, and dreading his own, took arms against the tyrant; but having failed in the attempt, he fled to France, where he found the minds of men much inflamed against Pedro, on account of the murder of the French princess. He asked permission of Charles to enlist the *companies* in his service, and to lead them into Castile against his brother. The French king, charmed with the project, employed du Guesclin in negociating with the leaders of these banditti. The treaty was soon concluded; and du Guesclin having completed his levies, led the army first to Avignon, where the pope then resided, and demanded, sword in hand, absolution for his ruffian soldiers, who had been excommunicated, and the sum of 200,000 livres for their subsistence. The first was readily promised him, but some difficulty being made with regard to the second, du Guesclin replied, "My fellows, I believe, may make a shift to do without your absolution, but the money is absolutely necessary." His holiness then extorted from the inhabitants of the city and its neighbourhood the sum of 100,000 livres, and offered it to du Guesclin. "It is not my purpose (cried that generous warrior) to oppress the innocent people. The pope and his cardinals can spare me double the sum from their own pockets. I therefore insist, that this money be restored to the owners; and if I hear they are defrauded of it, I will myself return from the other side of the Pyrenees, and oblige you to make them restitution." The pope found the necessity of submitting, and paid from his own treasury the sum demanded.

73 He is driven out, but assisted by the Black Prince.

A body of experienced and hardy soldiers, conducted by so able a general, easily prevailed over the king of Castile, whose subjects were ready to join the enemy against their oppressor. Pedro fled from his dominions, took shelter in Guienne, and craved the protection of the prince of Wales, whom his father had invested with the sovereignty of the ceded provinces, under the title of the *principality of Aquitaine*. The prince promised his assistance to the dethroned monarch; and having obtained his father's consent, he levied an army, and set out on his enterprise.

The first loss which Henry of Trastamara suffered from the interposition of the prince of Wales, was the recalling of the companies from his service; and so much reverence did they pay to the name of Edward, that great numbers of them immediately withdrew from Spain, and enlisted under his standard. Henry, however, beloved by his new subjects, and supported by the king of Arragon, was able to meet the enemy with an army of 100,000 men, three times the number of those commanded by the Black Prince: yet du Guesclin, and all his experienced officers, advised him to delay a decisive action; so high was their opinion of the valour and conduct of the English hero! But Henry, trusting to his numbers, ventured to give Edward battle on the banks of the Ebro, between Najara and Navarette;

74 The Spaniards defeated, and Peter restored.

where the French and Spaniards were defeated, with the loss of above 20,000 men, and du Guesclin and other officers of distinction taken prisoners. All Castile submitted to the victor; Pedro was restored to the throne, and Edward returned to Guienne with his usual glory; having not only overcome the greatest general of his age, but restrained the most blood-thirsty tyrant from executing vengeance on his prisoners.

This gallant warrior had soon reason to repent of his connection with a man like Pedro, lost to all sense of virtue and honour. The ungrateful monster refused the stipulated pay to the English forces. Edward abandoned him: he treated his subjects with the utmost barbarity; their animosity was roused against him; and du Guesclin having obtained his ransom, returned to Castile with the count of Trastamara, and some forces levied anew in France. They were joined by the Spanish malecontents; and having no longer the Black Prince

75 Is again driven out, defeated, and put to death.

to encounter, they gained a complete victory over Pedro in the neighbourhood of Toledo. The tyrant now took refuge in a castle, where he was soon after besieged by the victors, and taken prisoner in endeavouring to make his escape. He was conducted to his brother Henry; against whom he is said to have rushed in a transport of rage, disarmed as he was. Henry slew him with his own

own hand, in resentment of his cruelties; and, though a bastard, was placed on the throne of Castile, which he transmitted to his posterity.

There is little doubt that the character of Pedro has been greatly misrepresented, and that what is considered by most historians as tyranny and wanton cruelty, was only an inflexible regard to justice, necessary perhaps, in those days of anarchy and rebellion. Perhaps that unfortunate monarch owes to the hatred of those he meant to reduce to order, much of the obloquy which has been so plentifully bestowed upon him by historians, who have painted him to us as a tyrant so bloody, so wicked, as almost to exceed the bounds of probability. In Andalusia, where he fixed his residence and seemed most to delight, his memory is not held in the same abhorrence. The Sevillian writers speak of him very differently; and instead of his usual appellation of *Pedro el cruel*, distinguish him by that of *el justiciero*. It is certain that his bastard-brother and murderer, Henry of Trastamara, was guilty of crimes fully as atrocious as any of those imputed to Don Pedro; but as he destroyed him, his family, and adherents, the friends of the new spurious race of monarchs were left at full liberty to blacken the characters of the adverse party, without the fear of being called to an account for calumny, or even contradicted. Truth is now out of our reach; and for want of proper proofs to the contrary, we must sit down contented with what history has left us; and allow Don Pedro to have been one of the most inhuman butchers that ever disgraced a throne.

After the death of Pedro the Cruel, nothing remarkable happened in Spain for almost a whole century; but the debaucheries of Henry IV. of Castile roused the resentment of his nobles, and produced a most singular insurrection, which led to the aggrandizement of the Spanish monarchy.

76
Reign of Henry the Impotent. An. 1450.

This prince, surnamed the *Impotent*, though continually surrounded with women, began his unhappy reign in 1450. He was totally enervated by his pleasures; and every thing in his court conspired to set the Castilians an example of the most abject flattery and most abandoned licentiousness. The queen, a daughter of Portugal, lived as openly with her parasites and her gallants as the king did with his minions and his mistresses. Pleasure was the only object, and effeminacy the only recommendation to favour: the affairs of the state went every day into disorder; till the nobility, with the archbishop of Toledo at their head, combining against the weak and flagitious administration of Henry, arrogated to themselves, as one of the privileges of their order, the right of trying and passing sentence on their sovereign, which they executed in a manner unprecedented in history.

77
He is formally deposed.

All the malecontent nobility were summoned to meet at Avila: a spacious theatre was erected in a plain without the walls of the town: an image, representing the king, was seated on a throne, clad in royal robes, with a crown on its head, a sceptre in its hand, and the sword of justice by its side. The accusation against Henry was read, and the sentence of deposition pronounced, in presence of a numerous assembly. At the close of the first article of the charge, the archbishop of Toledo advanced, and tore the crown from the head of the image; at the close of the second, the Conde de Placentia snatched the sword of justice from its side; at the close of the third, the Conde de Benavente wrested the sceptre from its hand; and at the close of the last, Don Diego Lopez de Stuniga tumbled it headlong from the throne. At the same instant, Don Alphonso, Henry's brother, a boy of about twelve years of age, was proclaimed king of Castile and Leon in his stead.

This extraordinary proceeding was followed by a civil war, which did not cease till some time after the death of the young prince, on whom the nobles had bestowed the kingdom. The archbishop and his party then continued to carry on war in the name of Isabella the king's sister, to whom they gave the title of *Infanta*; and Henry could not extricate himself out of these troubles, nor remain quiet upon his throne till he had signed one of the most humiliating treaties ever extorted from a sovereign; he acknowledged his sister Isabella the only lawful heiress of his kingdom, in prejudice to the rights of his reputed daughter Joan, whom the malecontents affirmed to be the offspring of an adulterous commerce between the queen and Don la Cueva.

78
Is obliged to acknowledge his sister Isabella to be heiress to the kingdom.

The grand object of the malecontent party now was the marriage of the princess Isabella, upon which, it was evident, the security of the crown and the happiness of the people must in a great measure depend. The alliance was sought by several princes: the king of Portugal offered her his hand; the king of France demanded her for his brother, and the king of Aragon for his son Ferdinand. The malecontents very wisely preferred the Aragonian prince, and Isabella prudently made the same choice: articles were drawn up; and they were privately married by the archbishop of Toledo.

79
She is married to Ferdinand of Aragon.

Henry was enraged at this alliance, which he foresaw would utterly ruin his authority, by furnishing his rebellious subjects with the support of a powerful neighbouring prince. He disinherited his sister, and established the rights of his daughter. A furious civil war desolated the kingdom. The names of Joan and Isabella resounded from every quarter, and were everywhere the summons to arms. But peace was at length brought about. Henry was reconciled to his sister and Ferdinand; though it does not appear that he ever renewed Isabella's right to the succession: for he affirmed in his last moments, that he believed Joan to be his own daughter. The queen swore to the same effect; and Henry left a testamentary deed, transmitting the crown to this princess, who was proclaimed queen of Castile at Placentia. But the superior fortune and superior arms of Ferdinand and Isabella prevailed: the king of Portugal was obliged to abandon his niece and intended bride, after many ineffectual struggles, and several years of war. Joan retired into a convent; and the death of Ferdinand's father, which happened about this time, added the kingdoms of Aragon and Sicily to those of Leon and Castile.

80
Union of the kingdoms of Aragon and Sicily with Leon and Castile. An. 1474.

81
Administration of Ferdinand and Isabella.

Ferdinand and Isabella were persons of great prudence, and, as sovereigns, highly worthy of imitation: but they do not seem to have merited all the praises bestowed upon them by the Spanish historians. They did not live like man and wife, having all things in common under the direction of the husband; but like two princes in close alliance; they neither loved nor hated each other; were seldom in company together, had each a separate council; and were frequently jealous of one another in the administration. But they

were

Spain.

were inseparably united in their common interests; always acting upon the same principles, and forwarding the same ends. Their first object was the regulation of their government, which the civil wars had thrown into the greatest disorder. Rapine, outrage, and murder, were become so common, as not only to interrupt commerce, but in a great measure to suspend all intercourse between one place and another. These evils the joint sovereigns suppressed by their wise policy, at the same time that they extended the royal prerogative.

82 Institution of the Holy Brotherhood,

About the middle of the 13th century, the cities in the kingdom of Aragon, and after their example those in Castile, had formed themselves into an association, distinguished by the name of the *Holy Brotherhood.* They exacted a certain contribution from each of the associated towns; they levied a considerable body of troops in order to protect travellers and pursue criminals; and they appointed judges, who opened courts in various parts of the kingdom. Whoever was guilty of murder, robbery, or any act that violated the public peace, and was seized by the troops of the Brotherhood, was carried before their judges; who, without paying any regard to the exclusive jurisdiction which the lord of the place might claim, who was generally the author or abettor of the injustice, tried, and condemned the criminals. The nobles often murmured against the salutary institution; they complained of it as an encroachment on one of their most valuable privileges, and endeavoured to get it abolished. But Ferdinand and Isabella, sensible of the beneficial effects of the Brotherhood, not only in regard to the police of their kingdom, but in its tendency to abridge, and by degrees annihilate, the territorial jurisdiction of the nobility, countenanced the institution upon every occasion, and supported it with the whole force of royal authority; by which means the prompt and impartial administration of justice was restored, and with it tranquillity and order returned.

83 and of the Inquisition.

But at the same time that their Catholic majesties (for such was the title they now bore) were giving vigour to their civil government, and securing their subjects from violence and oppression, an intemperate zeal led them to establish an ecclesiastical tribunal, equally contrary to the natural rights of humanity and the mild spirit of the gospel. This was the court of inquisition; which decides upon the honour, fortune, and even the life, of the unhappy wretch who happens to fall under the suspicion of heresy, or a contempt of any thing prescribed by the church, without his knowing, being confronted with his accusers, or permitted either defence or appeal. Six thousand persons were burnt by order of this sanguinary tribunal within four years after the appointment of Torquemada, the first inquisitor-general; and upwards of 100,000 felt its fury. The same furious and blinded zeal which led to the depopulation of Spain, led also to its aggrandizement.

84 Conquest of Granada An. 1492.

The kingdom of Granada now alone remained of all the Mahometan possessions in Spain. Princes equally zealous and ambitious were naturally disposed to turn their eyes to that fertile territory, and to think of increasing their hereditary dominions, by expelling the enemies of Christianity, and extending its doctrines. Every thing conspired to favour their project: the Moorish kingdom was a prey to civil wars; when Ferdinand, having obtained the bull of Sixtus IV. authorizing a crusade, put himself at the head of his troops, and entered Granada. He continued the war with rapid success: Isabella attended him in several expeditions; and they were both in great danger at the siege of Malaga; an important city, which was defended with great courage, and taken in 1487. Baza was reduced in 1489, after the loss of 20,000 men. Gaudix and Almeria were delivered up to them by the Moorish king Alzagel, who had first dethroned his brother Alboacen, and afterwards been chased from his capital by his nephew Abdali. That prince engaged in the service of Ferdinand and Isabella; who, after reducing every other place of eminence, undertook the siege of Granada. Abdali made a gallant defence; but all communication with the country being cut off, and all hopes of relief at an end, he capitulated, after a siege of eight months, on condition that he should enjoy the revenue of certain places in the fertile mountains of Alpuxarras; that the inhabitants should retain the undisturbed possession of their houses, goods, and inheritances; the use of their laws, and the free exercise of their religion (B). Thus ended the empire of the Arabs in Spain, after it had continued about 800 years. They introduced the arts and sciences into Europe at a time when it was lost in darkness; they possessed many of the luxuries of life, when they were not even known among the neighbouring nations; and they seem to have given birth to that romantic gallantry which so eminently prevailed in the ages of chivalry, and which, blending itself with the veneration of the northern nations for the softer sex, still particularly distinguishes ancient from modern manners. But the Moors, notwithstanding these advantages, and the eulogies bestowed upon them by some writers, appear always to have been destitute of the essential qualities of a polished people, humanity, generosity, and mutual sympathy.

The overthrow of the last Moorish kingdom was soon followed by the expulsion of the Saracens from Spain. This expulsion did not entirely take place till the 17th century. Vast numbers of the Moors, indeed, oppressed by their conquerors, abandoned a country where they could not reside with comfort and with freedom. From the reign of Ferdinand of Castile, to that of Philip III. of Spain, more than 3,000,000 of those people quitted Spain, and carried with them, not only a great part of their acquired wealth, but that industry and love of labour which are the foundation of national prosperity.

85 Prosperous state of Spain under the Moorish dominion.

The state of Spain has never been so flourishing at any period of its civilization, as during the period when it was chiefly possessed by the Moors. The first Saracen invaders, and the twenty successive lieutenants of the caliphs of Damascus, were attended by a numerous train of civil and military followers, who preferred a distant

(B) The particulars of the conquest of Granada are involved in much obscurity. If we were to credit the narrative of Giles Perez, as related by Mr Swinburne, the circumstances which led to that conquest were of a most romantic nature. See Swinburne's Travels, Letter xxi.

Spain.

diſtant fortune to narrow circumſtances at home; the private and public intereſt was promoted by the eſtabliſhment of faithful colonies, and the cities of Spain were proud to commemorate the tribe or the country of their eaſtern progenitors. Ten years after the conqueſt, a map of the province was preſented to the caliph, ſhewing the ſeas, the rivers, and the harbours, the inhabitants and cities, the climate, the ſoil, and the mineral productions of the earth. In the ſpace of two centuries, the gifts of nature were improved by agriculture, the manufactures, and the commerce of an induſtrious people; though the effects of their diligence have been magnified by the idleneſs of their fancy. The firſt of the Ommiades who reigned in Spain ſolicited the ſupport of the Chriſtians; and in his edict of peace and protection, he contents himſelf with a modeſt impoſition of 10,000 ounces of gold, 10,000 pounds of ſilver, 10,000 horſes, as many mules, 1000 cuiraſſes, with an equal number of helmets and lances. The moſt powerful of his ſucceſſors derived from the ſame kingdom the annual tribute of 12,045,000 dinars or pieces of gold, about 6,000,000l. of ſterling money; a ſum which, in the 10th century, moſt probably ſurpaſſed the united revenues of the Chriſtian monarchs. His royal ſeat of Cordova contained 600 moſques, 900 baths, and 200,000 houſes; he gave laws to 80 cities of the firſt, to 300 of the ſecond and third order; and the fertile banks of the Guadalquivir were adorned with 12,000 villages and hamlets. The Arabs might exaggerate the truth; but they created and they deſcribe the moſt proſperous era of the riches, the cultivation, and the populouſneſs of Spain (c).

86
Jews expelled from Spain.

The conqueſt of Granada was followed by the expulſion, or rather the pillage and baniſhment, of the Jews, who had engroſſed all the wealth and commerce of Spain. The inquiſition exhauſted its rage againſt theſe unhappy people, many of whom pretended to embrace Chriſtianity, in order to preſerve their property. About the ſame time their Catholic majeſties concluded an alliance with the emperor Maximilian, and a treaty of marriage for their daughter Joan with his ſon Philip, archduke of Auſtria and ſovereign of the Netherlands. About this time alſo the contract was concluded with Chriſtopher Columbus for the diſcovery of new countries; and the counties of Rouſſillon and Cerdagne were agreed to be reſtored by Charles VIII. of France, before his expedition into Italy. The diſcovery of America was ſoon followed by extenſive conqueſts in that quarter, as is related under the articles Mexico, Peru, Chili, &c. which tended to raiſe the Spaniſh monarchy above any other in Europe.

87
Diſcovery of America, &c.

88
Acceſſion of Charles V. An. 1516.

On the death of Iſabella, which happened in 1506, Philip archduke of Auſtria came to Caſtile in order to take poſſeſſion of that kingdom as heir to his mother-in-law; but he dying in a ſhort time after, his ſon Charles V. afterwards emperor of Germany, became heir to the crown of Spain. His father at his death left the king of France governor to the young prince, and Ferdinand at his death left Cardinal Ximenes ſole regent of Caſtile, till the arrival of his grandſon. This man, whoſe character is no leſs ſingular than illuſtrious, who united the abilities of a great ſtateſman with the abject devotion of a ſuperſtitious monk, and the magnificence of a prime miniſter with the ſeverity of a mendicant, maintained order and tranquillity in Spain, notwithſtanding the diſcontents of a turbulent and high-ſpirited nobility. When they diſputed his right to the regency, he coolly ſhewed them the teſtament of Ferdinand, and the ratification of that deed by Charles; but theſe not ſatisfying them, and argument proving ineffectual, he led them inſenſibly towards a balcony, whence they had a view of a large body of troops under arms, and

(c) Abdoulrahman III. monarch of Cordova, ſurpaſſed all his predeceſſors in ſplendour, riches, and expence; and his ſubjects vied with each other in profuſion and magnificence. Some idea may be entertained of the opulence and grandeur of the Moors of Cordova in the 10th century, by peruſing the following enumeration of the preſents made to Abdoulrahman by Abumelik his grand vizir, on his appointment to that office. We are told that the miniſter cauſed to be brought before the throne, and laid at the feet of his maſter,

400 lbs. of virgin gold.
Ingots of ſilver to the value of 420,000 ſequins.
400 lbs. of lignum aloes, one piece weighing 140 lb.
500 oz. of ambergris.
300 oz. of camphor.
30 pieces of gold tiſſue, ſo rich that none but the caliph could wear it.
10 ſuits of Khoraſſan ſables.
100 ſuits of fur of a leſs valuable ſort.
48 ſets of gold and ſilk long trappings for horſes.
4000 lbs. of ſilk.
30 Perſian carpets.
800 iron coats-of-mail for war horſes.
1000 ſhields.
100,000 arrows.
15 led horſes of Arabia, as richly capariſoned as thoſe on which the caliph was wont to ride.
100 horſes of an inferior price.
20 mules with all their accoutrements.
40 young men, and 20 girls of exquiſite beauty, and moſt ſumptuouſly apparelled. This diſplay of riches was accompanied with a moſt flattering poem, compoſed by the miniſter in praiſe of his ſovereign, who in return for his homage, aſſigned him a penſion of 100,000 pieces of gold, about 50,000l. ſterling.

and a formidable train of artillery. "Behold (ſaid the cardinal) the powers which I have received from his Catholic majeſty: by theſe I govern Caſtile; and will govern it, till the king, your maſter and mine, ſhall come to take poſſeſſion of his kingdom." A declaration ſo bold and determined ſilenced all oppoſition; and Ximenes maintained his authority till the arrival of

89 Charles in 1517.

Diſgrace and death of Cardinal Ximenes.

The young king was received with univerſal acclamations of joy; but Ximenes found little cauſe to rejoice. He was ſeized with a violent diſorder, ſuppoſed to be the effect of poiſon; and when he recovered, Charles, prejudiced againſt him by the Spaniſh grandees and his Flemiſh courtiers, ſlighted his advice, and allowed him every day to ſink into neglect. The cardinal did not bear this treatment with his uſual fortitude of ſpirit. He expected a more grateful return from a prince to whom he delivered a kingdom more flouriſhing than it had been in any former age, and authority more extenſive and better eſtabliſhed than the moſt illuſtrious of his anceſtors had ever poſſeſſed. Conſcious of his own integrity and merit, he could not therefore refrain from giving vent, at times, to indignation and complaint. He lamented the fate of his country, and foretold the calamities to which it would be expoſed from the inſolence, the rapacioufneſs, and the ignorance of ſtrangers. But in the mean time he received a letter from the king, diſmiſſing him from his councils, under pretence of eaſing his age of that burden which he had ſo long and ſo ably ſuſtained. This letter proved fatal to the miniſter; for

90 he expired in a few hours after reading it.

Maximilian attempts to get Charles elected emperor.

While Charles was taking poſſeſſion of the throne of Spain, in conſequence of the death of one grandfather, another was endeavouring to obtain for him the imperial crown. With this view Maximilian aſſembled a diet at Augſburg, where he cultivated the favour of the electors by many acts of beneficence, in order to engage them to chooſe that young prince as his ſucceſſor. But Maximilian himſelf never having been crowned by the pope, a ceremony deemed eſſential in that age, as well as in the preceding, he was conſidered only as king of the Romans, or emperor elect; and no example occurring in hiſtory of any perſon being choſen ſucceſſor to a king of the Romans, the Germans, always tenacious of their forms, obſtinately refuſed to confer upon Charles a dignity for which their conſtitution knew no name.

But though Maximilian could not prevail upon the German electors to chooſe his grandſon of Spain king of the Romans, he had diſpoſed their minds in favour of that prince; and other circumſtances, on the death of the emperor, conſpired to the exaltation of Charles. The imperial crown had ſo long continued in the Auſtrian line, that it began to be conſidered as hereditary in that family; and Germany, torn by religious diſputes, ſtood in need of a powerful emperor, not only to preſerve its own internal tranquillity, but alſo to protect it againſt the victorious arms of the Turks, who under Selim I. threatened the liberties of Europe. This fierce and rapid conqueror had already ſubdued the Mamelukes, and made himſelf maſter of Egypt and Syria. The power of Charles appeared neceſſary to oppoſe that of Selim. The extenſive dominions of the houſe of Auſtria, which gave him an intereſt in the preſervation of Germany; the rich ſovereignty of the Netherlands and Franche Compté; the entire poſſeſſion of the great and warlike kingdom of Spain, together with that of Naples and Sicily, all united to hold him up to the firſt dignity among Chriſtian princes; and the new world ſeemed only to be called into exiſtence that its treaſures might enable him to defend Chriſtendom againſt the infidels. Such was the language of his partiſans.

91 Francis I. aſpires to the ſame dignity.

Francis I. however, no ſooner received intelligence of the death of Maximilian, than he declared himſelf a candidate for the empire; and with no leſs confidence of ſucceſs than Charles. He truſted to his ſuperior years and experience; his great reputation in arms; and it was farther urged in his favour, that the impetuoſity of the French cavalry, added to the firmneſs of the German infantry, would prove irreſiſtible, and not only be ſufficient, under a warlike emperor, to ſet limits to the ambition of Selim, but to break entirely the Ottoman power, and prevent it from ever becoming dangerous again to Germany.

Both claims were plauſible. The dominions of Francis were leſs extenſive, but more united than thoſe of Charles. His ſubjects were numerous, active, brave, lovers of glory, and lovers of their king. Theſe were ſtrong arguments in favour of his power, ſo neceſſary at this juncture: but he had no natural intereſt in the Germanic body; and the electors, hearing ſo much of military force on each ſide, became more alarmed for their own privileges than the common ſafety. They determined to reject both candidates, and offered the imperial crown to Frederic, ſurnamed the *Wiſe*, duke of Saxony. But he, undazzled by the ſplendour of an object courted with ſo much eagerneſs, by two mighty monarchs, rejected it with a magnanimity no leſs ſingular than great. 92

Speech of Frederic duke of Saxony in favour of Charles.

"In times of tranquillity (ſaid Frederic), we wiſh for an emperor who has no power to invade our liberties; times of danger demand one who is able to ſecure our ſafety. The Turkiſh armies, led by a warlike and victorious monarch, are now aſſembling: they are ready to pour in upon Germany with a violence unknown in former ages. New conjunctures call for new expedients. The imperial ſceptre muſt be committed to ſome hand more powerful than mine or that of any other German prince. We poſſeſs neither dominions, nor revenues, nor authority, which enable us to encounter ſuch a formidable enemy. Recourſe muſt be had, in this exigency, to one of the rival monarchs. Each of them can bring into the field forces ſufficient for our defence. But as the king of Spain is of German extraction, as he is a member and prince of the empire by the territories which deſcend to him from his grandfather, and as his dominions ſtretch along that frontier which lies moſt expoſed to the enemy, his claim, in my opinion, is preferable to that of a ſtranger to our language, to our blood, and to our country." Charles was elected in conſequence of this ſpeech in the year 1520. 93

He is elected in conſequence of this ſpeech. An. 1520.

The two candidates had hitherto conducted their rivalſhip with emulation, but without enmity. They had even mingled in their competition many expreſſions of friendſhip and regard. Francis in particular declared with his uſual vivacity, that his brother Charles and he were fairly and openly ſuitors to the ſame miſtreſs: "The moſt aſſiduous and fortunate (added he) will win her; and the other muſt reſt contented." But the preference was no ſooner given to his rival, than Francis diſcovered

Spain.

discovered all the passions natural to disappointed ambition. He could not suppress his chagrin and indignation at being baulked in his favourite pursuit, and rejected, in the face of all Europe, for a youth yet unknown to fame. The spirit of Charles resented such contempt; and from this jealousy, as much as from opposition of interests, arose that emulation between those two great monarchs which involved them in almost perpetual hostilities, and kept their whole age in constant agitation.

94 A mutual hatred takes place between Charles and Francis.

Charles and Francis had many interfering claims in Italy; and the latter thought himself bound in honour to restore the king of Navarre to his dominions, unjustly seized by the crown of Spain. They immediately began to negotiate; and as Henry VIII. of England was the third prince of the age in power and in dignity, his friendship was eagerly courted by each of the rivals. He was the natural guardian of the liberties of Europe. Sensible of the consequence which his situation gave him, and proud of his pre-eminence, Henry knew it to be his interest to keep the balance even between the contending powers, and to restrain both, by not joining entirely with either; but he was seldom able to reduce his ideas to practice. Vanity and resentment were the great springs of all his undertakings; and his neighbours, by touching these, found an easy way to draw him into their measures, and force him upon many rash and inconsiderate enterprises.

95 Both court the friendship of Henry VIII. of England.

All the impolitic steps in Henry's government must not, however, be imputed to himself; many of them were occasioned by the ambition and avarice of his prime minister and favourite Cardinal Wolsey. This man, who, by his talents and accomplishments, had risen from one of the lowest conditions in life to the highest employments both in church and state, enjoyed a greater degree of power and dignity than any English subject ever possessed, and governed the haughty, presumptuous, and untractable spirit of Henry, with absolute authority. Francis was equally well acquainted with the character of Henry and of his minister. He had successfully flattered Wolsey's pride, by honouring him with particular marks of his confidence, and bestowing upon him the appellations of *Father*, *Tutor*, and *Governor;* and he had obtained the restitution of Tournay, by adding a pension to those respectful titles. He now solicited an interview with the king of England near Calais; in hopes of being able, by familiar conversation, to attach him to his friendship and interest, while he gratified the cardinal's vanity, by affording him an opportunity of displaying his magnificence in the presence of two courts, and of discovering to the two nations his influence over their monarchs. Charles dreaded the effects of this projected interview between two gallant princes, whose hearts were no less susceptible of friendship than their manners were of inspiring it. Finding it impossible, however, to prevent a visit, in which the vanity of all parties was so much concerned, he endeavoured to defeat its purpose, and to pre-occupy the favour of the English monarch, and of his minister, by an act of complaisance still more flattering and more uncommon. Relying wholly upon Henry's generosity for his safety, he landed at Dover, in his way from Spain to the Low Countries. The king of England, who was on his way to France, charmed with such an instance of confidence, hastened to receive his royal guest;

96 An interview projected between Francis and Henry.

97 Charles visits Henry in England.

and Charles, during his short stay, had the address not only to give Henry favourable impressions of his character and intentions, but to detach Wolsey entirely from the interest of Francis. The tiara had attracted the eye of that ambitious prelate; and as the emperor knew that the papacy was the sole point of elevation, beyond his present greatness, at which he could aspire, he made him an offer of his interest on the first vacancy.

98 Henry visits Francis in France.

The day of Charles's departure, Henry went over to Calais with his whole court, in order to meet Francis. Their interview was in an open plain between Guisnes and Ardres; where the two kings and their attendants displayed their magnificence with such emulation and profuse expence, as procured it the name of the *Field of the Cloth of Gold.* Here Henry erected a spacious house of wood and canvas, framed in London, on which, under the figure of an English archer, was the following motto, "He prevails whom I favour;" alluding to his own political situation, as holding in his hands the balance of power among the potentates of Europe. Feats of chivalry however, parties of gallantry, and such exercises as were in that age reckoned manly or elegant, rather than serious business, occupied the two courts during the time that they continued together, which was 18 days.

After taking leave of this scene of dissipation, the king of England paid a visit to the emperor and Margaret of Savoy at Gravelines, and engaged them to go along with him to Calais; where the artful and politic Charles completed the impression which he had begun to make on Henry and his favourite, and effaced all the friendship to which the frank and generous nature of Francis had given birth. He renewed his assurances of assisting Wolsey in obtaining the papacy; and he put him in present possession of the revenues belonging to the sees of Badajoz and Palencia in Spain. He flattered Henry's pride, by convincing him of his own importance, and of the justness of the motto which he had chosen; offering to submit to his sole arbitration any difference that might arise between him and Francis.

99 Charles invested with the imperial crown at Aix-la-Chapelle.

This important point being secured, Charles repaired to Aix-la-Chapelle, where he was solemnly invested with the crown and sceptre of Charlemagne, in presence of a more splendid and numerous assembly than had appeared on any former inauguration. About the same time Solyman the Magnificent, one of the most accomplished, enterprising, and victorious of the Turkish princes, and a constant and formidable rival to the emperor, ascended the Ottoman throne.

The first act of Charles's administration was to appoint a diet of the empire, to be held at Worms, in order to concert with the princes proper measures for checking the progress of "those new and dangerous opinions which threatened to disturb the peace of Germany, and to overturn the religion of their ancestors." The opinions propagated by Luther and his followers were here meant. But all his efforts for that purpose were insufficient, as is related under the articles LUTHER and REFORMATION.

100 War between Francis and Charles. An. 1521

In 1521, the Spaniards, dissatisfied with the departure of their sovereign, whose election to the empire they foresaw would interfere with the administration of his own kingdom, and incensed at the avarice of the Flemings, to whom the direction of public affairs had been

been committed ſince the death of Cardinal Ximenes, ſeveral grandees, in order to ſhake off this oppreſſion, entered into an aſſociation, to which they gave the name of the *Sancta Juncta;* and the ſword was appealed to as the means of redreſs. This ſeemed to Francis a favourable juncture for reinſtating the family of John d'Albert in the kingdom of Navarre. Charles was at a diſtance from that part of his dominions, and the troops uſually ſtationed there had been called away to quell the commotions in Spain. A French army, under Andrew de Foix, ſpeedily conquered Navarre; but that young and inexperienced nobleman, puſhed on by military ardour, ventured to enter Caſtile. The Spaniards, though divided among themſelves, united againſt a foreign enemy, routed his forces, took him priſoner, and recovered Navarre in a ſhorter time than he had ſpent in ſubduing it.

Hoſtilities thus begun in one quarter, between the rival monarchs, ſoon ſpread to another. The king of France encouraged the duke of Bouillon to make war againſt the emperor, and to invade Luxembourg. Charles, after humbling the duke, attempted to enter France; but was repelled and worſted before Mezieres by the famous Chevalier Bayard, diſtinguiſhed among his cotemporaries by the appellation of *The Knight without fear and without reproach;* and who united the talents of a great general to the punctilious honour and romantic gallantry of the heroes of chivalry. Francis broke into the Low Countries, where, by an exceſs of caution, an error not natural to him, he loſt an opportunity of cutting off the whole imperial army; and, what was of ſtill more conſequence, he diſguſted the conſtable Bourbon, by giving the command of the van to the duke of Alençon.

During theſe operations in the field, an unſucceſsful congreſs was held at Calais, under the mediation of Henry VIII. It ſerved only to exaſperate the parties which it was intended to reconcile. A league was ſoon after concluded, by the intrigues of Wolſey, between the pope, Henry, and Charles, againſt France. Leo had already entered into a ſeparate league with the emperor, and the French were faſt loſing ground in Italy.

The inſolence and exactions of Mareſhal de Lautrec, governor of Milan, had totally alienated the affections of the Milaneſe from France. They reſolved to expel the troops of that nation, and put themſelves under the government of Francis Sforza, brother to Maximilian their late duke. In this reſolution, they were encouraged by the pope, who excommunicated Lautrec, and

101 Rapid conqueſts of Charles.

took into his pay a conſiderable body of Swiſs. The papal army, commanded by Proſper Colonna, an experienced general, was joined by ſupplies from Germany and Naples; while Lautrec, neglected by his court, and deſerted by the Swiſs in its pay, was unable to make head againſt the enemy. The city of Milan was betrayed by the inhabitants to the confederates; Parma and Placentia were united to the eccleſiaſtical ſtate; and of their conqueſts in Lombardy, only the town of Cremona, the caſtle of Milan, and a few inconſiderable forts, remained in the hands of the French.

Leo X. received the accounts of this rapid ſucceſs with ſuch tranſports of joy, as are ſaid to have brought on a fever, which occaſioned his death. The ſpirit of the confederacy was broken, and its operations ſuſpended by this accident. The Swiſs were recalled; ſome other mercenaries diſbanded for want of pay; and only the Spaniards, and a few Germans in the emperor's ſervice, remained to defend the duchy of Milan. But Lautrec, who with the remnant of his army had taken ſhelter in the Venetian territories, deſtitute both of men and money, was unable to improve this favourable opportunity as he wiſhed. All his efforts were rendered ineffectual by the vigilance and ability of Colonna and his aſſociates.

Meantime much diſcord prevailed in the conclave. Wolſey's name, notwithſtanding all the emperor's magnificent promiſes, was ſcarcely mentioned there. Julio de Medici, Leo's nephew, thought himſelf ſure of the election; when, by an unexpected turn of fortune, Cardinal Adrian of Utrecht, Charles's preceptor, who at that time governed Spain in the emperor's name, was unanimouſly raiſed to the papacy, to the aſtoniſhment of all Europe and the great diſguſt of the Italians.

Francis, rouſed by the riſing conſequence of his rival, reſolved to exert himſelf with freſh vigour, in order to wreſt from him his late conqueſts in Lombardy. 102 Francis invades Italy.

Lautrec received a ſupply of money, and a reinforcement of 10,000 Swiſs. With this reinforcement he was enabled once more to act offenſively, and even to advance within a few miles of the city of Milan; when money again failing him, and the Swiſs growing mutinous, he was obliged to attack the imperialiſts in their camp at Bicocca, where he was repulſed with great ſlaughter, having loſt his braveſt officers and beſt troops. Such of the Swiſs as ſurvived ſet out immediately for their own country; and Lautrec, deſpairing of being able to keep the field, retired into France. Genoa, which ſtill remained ſubject to Francis, and made it eaſy to execute any ſcheme for the recovery of Milan, was ſoon after taken by Colonna: the authority of the emperor and his faction was everywhere eſtabliſhed in Italy. The citadel of Cremona was the ſole fortreſs which remained in the hands of the French.

The affliction of Francis for ſuch a ſucceſſion of misfortunes was augmented by the unexpected arrival of an Engliſh herald, who in the name of his ſovereign declared war againſt France. The courage of this excellent prince, however, did not forſake him; though his treaſury was exhauſted by expenſive pleaſures, no leſs than by hoſtile enterpriſes, he aſſembled a conſiderable army, and put his kingdom in a poſture of defence for reſiſting this new enemy, without abandoning any of the ſchemes which he was forming againſt the emperor. He was ſurpriſed, but not alarmed, at ſuch a denunciation.

Meanwhile Charles, willing to draw as much advantage as poſſible from ſo powerful an ally, paid a ſecond viſit to the court of England in his way to Spain, where his preſence was become neceſſary. 103 Charles viſits England a ſecond time.

His ſucceſs exceeded his moſt ſanguine expectations. He not only gained the entire friendſhip of Henry, who publicly ratified the treaty of Bruges; but diſarmed the reſentment of Wolſey, by aſſuring him of the papacy on Adrian's death; an event ſeemingly not diſtant, by reaſon of his age and infirmities. In conſequence of theſe negociations an Engliſh army invaded France, under the command of the earl of Surrey; who, at the end of the campaign, was obliged to retire, with his forces greatly reduced,

Spain.

reduced, without being able to make himſelf maſter of one place within the French frontier. Charles was more fortunate in Spain: he ſoon quelled the tumults which had there ariſen in his abſence.

While the Chriſtian princes were thus waſting each other's ſtrength, Solyman the Magnificent entered Hungary, and made himſelf maſter of Belgrade, reckoned the chief barrier of that kingdom againſt the Turkiſh power. Encouraged by this ſucceſs, he turned his victorious arms againſt the iſland of Rhodes, at that time the ſeat of the knights of St John of Jeruſalem;

104
Rhodes taken by Solyman.

and though every prince in that age acknowledged Rhodes to be the great bulwark of Chriſtendom in the eaſt, ſo violent was their animoſity againſt each other, that they ſuffered Solyman without diſturbance to carry on his operations againſt that city and iſland. Liſle Adam, the grandmaſter, made a gallant defence; but, after incredible efforts of courage, patience, and military conduct, during a ſiege of ſix months, he was obliged to ſurrender the place, having obtained an honourable capitulation from the ſultan, who admired and reſpected his heroic qualities (ſee RHODES and MALTA). Charles and Francis were equally aſhamed of having occaſioned ſuch a loſs to Chriſtendom by their conteſts; and the emperor, by way of reparation, granted to the knights of St John the ſmall iſland of Malta, where they fixed their reſidence, and continued long to retain their ancient ſpirit, though much diminiſhed in power and ſplendour.

Adrian VI. though the creature of the emperor, and devoted to his intereſt, endeavoured to aſſume the impartiality which became the common father of Chriſtendom, and laboured to reconcile the contending princes, that they might unite in a league againſt Solyman, whoſe conqueſt of Rhodes rendered him more formidable than ever to Europe. The Italian ſtates were no leſs deſirous of peace than the pope: and ſo much regard was paid by the hoſtile powers to the exhortations of his holineſs, and to a bull which he iſſued, requiring all Chriſtian princes to conſent to a truce for three years, that the imperial, the French, and the Engliſh ambaſſadors at Rome, were empowered to treat of that matter; but while they waſted their time in fruitleſs negociations, their maſters were continuing their preparations for war; and other negociations ſoon took place.

105
A powerful confederacy againſt Francis.

The confederacy againſt France became more formidable than ever.

The Venetians, who had hitherto adhered to the French intereſt, formed engagements with the emperor for ſecuring Francis Sforza in the poſſeſſion of the duchy of Milan; and the pope, from a perſuaſion that the ambition of the French monarch was the only obſtacle to peace, acceded to the ſame alliance. The Florentines, the dukes of Ferrara and Mantua, and all the Italian powers, followed this example. Francis was left without a ſingle ally, to reſiſt the efforts of a multitude of enemies, whoſe armies every where threatened, and whoſe territories encompaſſed his dominions. The emperor in perſon menaced France with an invaſion on the ſide of Guienne; the forces of England and the Netherlands hovered over Picardy, and a numerous body of Germans was preparing to ravage Burgundy.

The dread of ſo many and ſuch powerful adverſaries, it was thought, would have obliged Francis to keep wholly on the defenſive, or at leaſt have prevented him from entertaining any thoughts of marching into Italy. But before his enemies were able to ſtrike a blow, Francis had aſſembled a great army, with which he hoped to diſconcert all the emperor's ſchemes, by marching it in perſon into Italy: and this bold meaſure, the more formidable becauſe unexpected, could ſcarcely have failed of the deſired effect, had it been immediately carried into execution. But the diſcovery of a domeſtic conſpiracy, which threatened the deſtruction of his kingdom, obliged Francis to ſtop ſhort at Lyons.

106
Francis marches towards Italy, but is obliged to return by a domeſtic conſpiracy.

Charles duke of Bourbon, lord high conſtable of France, was a prince of the moſt ſhining merit: his great talents equally fitted him for the council or the field, while his eminent ſervices to the crown intitled him to its firſt favour. But unhappily Louiſa ducheſs of Angouleme, the king's mother, had contracted a violent averſion againſt the houſe of Bourbon, and had taught her ſon, over whom ſhe had acquired an abſolute aſcendant, to view all the conſtable's actions with a jealous eye. After repeated affronts he retired from court, and began to liſten to the advances of the emperor's miniſters. Meantime the ducheſs of Bourbon died; and as the conſtable was no leſs amiable than accompliſhed, the ducheſs of Angouleme, ſtill ſuſceptible of the tender paſſions, formed the ſcheme of marrying him. But Bourbon, who might have expected every thing to which an ambitious mind can aſpire, from the doating fondneſs of a woman who governed her ſon and the kingdom, incapable of imitating Louiſa in her ſudden tranſition from hate to love, or of meanly counterfeiting a paſſion for one who had ſo long purſued him with unprovoked malice, rejected the match with diſdain, and turned the propoſal into ridicule. At once deſpiſed and inſulted by the man whom love only could have made her ceaſe to perſecute, Louiſa was filled with all the rage of diſappointed woman; ſhe reſolved to ruin, ſince ſhe could not marry, Bourbon. For this purpoſe ſhe commenced an iniquitous ſuit againſt him; and by the chicanery of Chancellor du Prat, the conſtable was ſtripped of his whole family-eſtate. Driven to deſpair by ſo many injuries, he entered into a ſecret correſpondence with the emperor and the king of England; and he propoſed, as ſoon as Francis ſhould have croſſed the Alps, to raiſe an inſurrection among his numerous vaſſals, and introduce foreign enemies into the heart of France.

Happily Francis got intimation of this conſpiracy before he left the kingdom; but not being ſufficiently convinced of the conſtable's guilt, he ſuffered ſo dangerous a foe to eſcape; and Bourbon entering into the emperor's ſervice, employed all the force of his enterpriſing genius, and his great talents for war, to the prejudice of his prince and his native country.

In conſequence of the diſcovery of this plot, and the eſcape of the powerful conſpirator, Francis relinquiſhed his intention of leading his army in perſon into Italy. He was ignorant how far the infection had ſpread among his ſubjects, and afraid that his abſence might encourage them to make ſome deſperate attempt in favour of a man ſo much beloved. He did not, however, abandon his deſign on the Milaneſe, but ſent forward an army of 30,000 men, under the command of Admiral Bonnivet.

107
French army enters Italy.

Colonna, who was entruſted with the defence of that duchy, was in no condition to reſiſt ſuch a force; and the city of Milan, on which the whole territory depends,

Spain. pends, muſt have fallen into the hands of the French, had not Bonnivet, who poſſeſſed none of the talents of a general, waſted his time in frivolous enterpriſes, till the inhabitants recovered from their conſternation. The imperial army was reinforced. Colonna died; and Lannoy, viceroy of Naples, ſucceeded him in the command: but the chief direction of military operations was committed to Bourbon and the marquis de Peſcara, the greateſt generals of their age. Bonnivet, deſtitute of troops to oppoſe this new army, and ſtill more of the talents which could render him a match for its leaders, after various movements and encounters, was reduced to the neceſſity of attempting a retreat into France.
108 He was followed by the imperial generals, and routed
Defeated at Biagraſſa. at Biagraſſa, where the famous Chevalier Bayard was killed.

The emperor and his allies were leſs ſucceſsful in their attempts upon France. They were baffled in every quarter: and Francis, though ſtripped of his Italian dominions, might ſtill have enjoyed in ſafety the glory of having defended his native kingdom againſt one half of Europe, and have bid defiance to all his enemies; but underſtanding that the king of England, diſcouraged by his former fruitleſs enterpriſes, and diſguſt-
109 Francis determines to enter Italy in perſon. ed with the emperor, was making no preparations for any attempt on Picardy, his ancient ardour ſeized him for the conqueſt of Milan, and he determined, notwithſtanding the advanced ſeaſon, to march into Italy.

The French army no ſooner appeared in Piedmont, than the whole Milaneſe was thrown into conſternation. The capital opened its gates. The forces of the emperor and Sforza retired to Lodi: and had Francis been ſo fortunate as to purſue them, they muſt have abandoned that poſt, and been totally diſperſed; but his evil genius led him to beſiege Pavia, a town of conſiderable ſtrength, well garriſoned, and defended by An-
110 tonio de Leyva, one of the braveſt officers in the Spa-
Is defeated and taken priſoner at Pavia. niſh ſervice; before which place he was defeated and taken priſoner on the twenty-fourth day of February 1524.

An. 1524. The captivity of Francis filled all Europe with alarm. Almoſt the whole French army was cut off; Milan was immediately abandoned; and in a few weeks not a Frenchman was left in Italy. The power of the emperor, and ſtill more his ambition, became an object of univerſal terror; and reſolutions were everywhere taken to ſet bounds to it. Meanwhile Francis, deeply impreſſed with a ſenſe of his misfortune, wrote to his mother Louiſa, whom he had left regent of the kingdom, the following ſhort but expreſſive letter: "All, Madam,
111 is loſt but honour." The ſame courier that carried this
Hypocritical conduct of Charles. letter, carried alſo diſpatches to Charles; who received the news of the ſignal and unexpected ſucceſs which had crowned his arms with the moſt hypocritical moderation. He would not ſuffer any public rejoicings to be made on account of it; and ſaid, he only valued it, as it would prove the occaſion of reſtoring peace to Chriſtendom. Louiſa, however, did not truſt to thoſe appearances; if ſhe could not preſerve what was yet left, ſhe determined at leaſt that nothing ſhould be loſt through her negligence or weakneſs. Inſtead of giving herſelf up to ſuch lamentations as were natural to a woman ſo remarkable for maternal tenderneſs, ſhe diſcovered all the foreſight, and exerted all the activity, of a conſummate politician. She took every poſſible meaſure for putting the kingdom in a poſture of defence, while ſhe employed all her addreſs to appeaſe the reſentment and to gain the friendſhip of England; and a ray of comfort from that quarter ſoon broke in upon the French affairs.

Though Henry VIII. had not entered into the war againſt France from any concerted political views, he had always retained ſome imperfect idea of that balance of power which it was neceſſary to maintain between Charles and Francis; and the preſervation of which he boaſted to be his peculiar office. By his alliance with the emperor, he hoped to recover ſome part of thoſe territories on the continent which had belonged to his anceſtors; and therefore willingly contributed to give him the aſcendency above his rival; but having never dreamt of any event ſo deciſive and fatal as the victory at Pavia, which ſeemed not only to have broken, but to have annihilated the power of Francis, he now became ſenſible of his own danger, as well as that of all Europe, from the loſs of a proper counterpoiſe to the power of 112
Charles. Inſtead of taking advantage of the diſtreſſed France aſſiſted by Henry VIII.
condition of France, Henry therefore determined to aſſiſt her in her preſent calamities. Some diſguſts alſo had taken place between him and Charles, and ſtill more between Charles and Wolſey. The elevation of the cardinal of Medici to St Peter's chair, on the death of Adrian, under the name of Clement VII. had made the Engliſh miniſter ſenſible of the inſincerity of the emperor's promiſes, while it extinguiſhed all his hopes of the papacy; and he reſolved on revenge. Charles, too, had ſo ill ſupported the appearance of moderation which he aſſumed, when firſt informed of his good fortune, that he had already changed his uſual ſtyle to Henry; and inſtead of writing to him with his own hand, and ſubſcribing himſelf "your affectionate ſon and couſin," he dictated his letters to a ſecretary, and ſimply ſubſcribed himſelf "Charles." Influenced by all theſe motives, together with the glory of raiſing a fallen enemy, Henry liſtened to the flattering ſubmiſſions of Louiſa; entered into a defenſive alliance with her as regent of France, and engaged to uſe his beſt offices in order to procure the deliverance of her ſon from a ſtate of captivity. 113

Meanwhile Francis was rigorouſly confined; and ſe- Francis ſeverely uſed by his conqueror.
vere conditions being propoſed to him as the price of his liberty, he drew his dagger, and, pointing it at his breaſt, cried, "'Twere better that a king ſhould die thus!" His hand was withheld: and flattering himſelf, when he grew cool, that ſuch propoſitions could not come directly from Charles, he deſired that he might be removed to Spain, where the emperor then reſided. His requeſt was complied with; but he languiſhed long before he obtained a ſight of his conqueror. At laſt he was favoured with a viſit; and the emperor dreading a general combination againſt him, or that Francis, as he threatened, might, in the obſtinacy of his heart, reſign his crown to the dauphin, agreed to abate ſomewhat of his former demands. A treaty was accordingly concluded at Madrid; in conſequence of which Francis obtained his liberty. The chief article in this treaty was, that Burgundy ſhould be reſtored to Charles as the rightful inheritance of his anceſtors, and 114
that Francis's two eldeſt ſons ſhould be immediately de- Is at laſt releaſed.
livered up as hoſtages for the performance of the conditions ſtipulated. The exchange of the captive monarch

Spain. narch for his children was made on the borders between France and Spain. The moment that Francis entered his own dominions, he mounted a Turkish horse, and putting it to its speed, waved his hand, and cried aloud several times, "I am yet a king! I am yet a king."

115 Refuses to execute the conditions of his release.

Francis never meant to execute the treaty of Madrid: he had even left a protest in the hands of notaries before he signed it, that his consent should be considered as an involuntary deed, and be deemed null and void. Accordingly, as soon as he arrived in France, he assembled the states of Burgundy, who protested against the article relative to their province; and Francis coldly replied to the imperial ambassadors, who urged the immediate execution of the treaty, that he would religiously perform the articles relative to himself, but in those affecting the French monarchy, he must be directed by the sense of the nation. He made the highest acknowledgements to the king of England for his friendly interposition, and offered to be entirely guided by his counsels. Charles and his ministers saw that they were over-reached in those very arts of negotiation in which they so much excelled, while the Italian states observed with pleasure, that Francis was resolved not to execute a treaty which they considered as dangerous to the liberties of Europe. Clement absolved him from the oath which he had taken at Madrid; and the kings of France and England, the pope, the Swiss, the Venetians, the Florentines, and the duke of Milan, entered into an alliance, to which they gave the name of the *Holy League*, because his Holiness was at the head of it, in order to oblige the emperor to deliver up Francis's two sons on the payment of a reasonable ransom, and to re-establish Sforza in the quiet possession of the Milanese.

In consequence of this league, the confederate army took the field, and Italy once more became the scene of war. But Francis, who it was thought would have infused spirit and vigour into the whole body, had gone through such a scene of distress, that he was become diffident of himself, distrustful of his fortune, and desirous of tranquillity. He flattered himself, that the dread alone of such a confederacy would induce Charles to listen to what was equitable, and therefore neglected to send due reinforcements to his allies in Italy. Meantime the duke of Bourbon, who commanded the Imperialists, had made himself master of the whole Milanese, of which the emperor had promised him the investiture; and his troops beginning to mutiny for want of pay, he led them to Rome, and promised to enrich them with the spoils of that city. He was as good as his word; for though he himself was slain in planting a scaling ladder against the walls, his soldiers, rather enraged than discouraged by his death, mounted to the assault with the utmost ardour, animated by the greatness of the prize, and, entering the city sword in hand, plundered it for several days.

116 Rome taken by the imperialists,

117 and most cruelly plundered.

Never did Rome in any age suffer so many calamities, not even from the Barbarians, by whom she was often subdued, the Huns, Vandals, or Goths, as now from the subjects of a Christian and Catholic monarch. Whatever was respectable in modesty, or sacred in religion, seemed only the more to provoke the rage of the soldiery. Virgins suffered violation in the arms of their parents, and upon those altars to which they had fled for safety. Venerable prelates, after enduring every indignity and every torture, were thrown into dungeons, and menaced with the most cruel death, in order to make them reveal their secret treasures. Clement himself, who had neglected to make his escape in time, was taken prisoner, and found that the sacredness of his character could neither procure him liberty nor respect. He was confined till he should pay an enormous ransom imposed by the victorious army, and surrender to the emperor all the places of strength belonging to the church.

118 The pope confined.

119 Shameful hypocrisy of Charles.

Charles received the news of this extraordinary event with equal surprise and pleasure; but in order to conceal his joy from his Spanish subjects, who were filled with horror at the insult offered to the sovereign pontiff, and to lessen the indignation of the rest of Europe, he expressed the most profound sorrow for the success of his arms. He put himself and his court into mourning; stopped the rejoicings for the birth of his son Philip, and ordered prayers to be put up in all the churches of Spain for the recovery of the pope's liberty, which he could immediately have procured by a letter to his generals.

The concern expressed by Henry and Francis for the calamity of their ally was more sincere. Alarmed at the progress of the imperial arms, they had, even before the taking of Rome, enter into a closer alliance, and agreed to invade the Low Countries with a powerful army; but no sooner did they hear of the pope's captivity, than they changed, by a new treaty, the scene of the projected war from the Netherlands to Italy, and resolved to take the most vigorous measures for restoring him to liberty. Henry, however, contributed only money. A French army entered Italy, under the command of Marshal Lautrec; Clement obtained his freedom; and war was for a time carried on by the confederates with success; but the death of Lautrec, and the revolt of Andrew Doria, a Genoese admiral in the service of France, entirely changed the face of affairs. The French army was utterly ruined; and Francis, discouraged and almost exhausted by so many unsuccessful enterprises, began to think of peace, and of obtaining the release of his sons by concessions, not by the terror of his arms.

120 A French army enters Italy, but is utterly ruined.

At the same time Charles, notwithstanding the advantages he had gained, had many reasons to wish for an accommodation. Sultan Solyman having overrun Hungary, was ready to break in upon the Austrian territories with the whole force of the East; and the progress of the Reformation in Germany threatened the tranquillity of the empire. In consequence of this situation of affairs, though pride made both parties conceal or dissemble their real sentiments, two ladies were permitted to restore peace to Europe. Margaret of Austria, Charles's aunt, and Louisa, Francis's mother, met in 1529 at Cambray, and settled the terms of accommodation between the French king and the emperor. Francis agreed to pay two millions of crowns as the ransom of his two sons, to resign the sovereignty of Flanders and Artois, and to forego all his Italian claims; and Charles ceased to demand the restitution of Burgundy.

121 Peace concluded at Cambray.

All the steps of this negociation had been communicated to the king of England; and Henry was, on that occasion, so generous to his friend and ally Francis, that he sent him an acquittal of near six hundred thousand crowns, in order to enable him to fulfil his agreement

with

Spain.

with Charles. But Francis's Italian confederates were less satisfied with the treaty of Cambray. They were almost wholly abandoned to the will of the emperor; and seemed to have no other means of security left but his equity and moderation. Of these, from his past conduct, they had not formed the most advantageous idea. But Charles's present circumstances, more especially in regard to the Turks, obliged him to behave with a generosity inconsistent with his character. The Florentines alone, whom he reduced under the dominion of the family of Medici, had reason to complain of his severity. Sforza obtained the investiture of Milan and his pardon: and every other power experienced the lenity of the conqueror.

122
Charles goes into Germany.

After having received the imperial crown from the hands of the pope at Bologna, Charles proceeded on his journey to Germany, where his presence was become highly necessary; for although the conduct and valour of his brother Ferdinand, on whom he had conferred the hereditary dominions of the house of Austria, and who had been elected king of Hungary, had obliged Solyman to retire with infamy and loss, his return was to be feared, and the disorders of religion were daily increasing; an account of which, and of the emperor's transactions with the Protestants, is given under the article REFORMATION.

123
He undertakes an expedition against the state of Barbary.
An. 1541.

Charles having exerted himself as much as he could against the reformers, undertook his first expedition against the piratical states of Africa. Barbary, or that part of the African continent lying along the coast of the Mediterranean sea, was then nearly in the same condition which it is at present. Morocco, Algiers, and Tunis, were its principal states; and the two last were nests of pirates. Barbarossa, a famous corsair, had succeeded his brother in the kingdom of Algiers, which he had formerly assisted him to usurp. He regulated with much prudence the interior police of his kingdom, carried on his piracies with great vigour, and extended his conquests on the continent of Africa; but perceiving that the natives submitted to his government with impatience, and fearing that his continual depredations would one day draw upon him a general combination of the Christian powers, he put his dominions under the protection of the grand seignior. Solyman, flattered by such an act of submission, and charmed with the boldness of the man, offered him the command of the Turkish fleet. Proud of this distinction, Barbarossa repaired to Constantinople, and made use of his influence with the sultan to extend his own dominion. Partly by force, partly by treachery, he usurped the kingdom of Tunis; and being now possessed of greater power, he carried on his depredations against the Christian states with more destructive violence than ever.

Daily complaints of the piracies and ravages committed by the galleys of Barbarossa were brought to the emperor by his subjects, both in Spain and Italy; and all Christendom seemed to look up to him, as its greatest and most fortunate prince, for relief from this new and odious species of oppression. At the same time Muley-Hascen, the exiled king of Tunis, finding none of the African princes able or willing to support him in recovering his throne, applied to Charles for assistance against the usurper. Equally desirous of delivering his dominions from the dangerous neighbourhood of Barbarossa, of appearing as the protector of an unfortunate prince, and of acquiring the glory annexed in that age to every expedition against the Mahometans, the emperor readily concluded a treaty with Muley Hascen, and set sail for Tunis with a formidable armament. The Goletta, a sea-port town, fortified with 300 pieces of cannon, was taken, together with all Barbarossa's fleet: he was defeated in a pitched battle, and 10,000 Christian slaves, having knocked off their fetters, and made themselves masters of the citadel, Tunis was preparing to surrender. But while Charles was deliberating on the conditions, his troops fearing that they would be deprived of the booty which they had expected, broke suddenly into the town, and pillaged and massacred without distinction. Thirty thousand persons perished by the sword, and 10,000 were made prisoners. The sceptre was restored to Muley Hascen, on condition that he should acknowledge himself a vassal of the crown of Spain, put into the emperor's hands all the fortified sea-ports in the kingdom of Tunis, and pay annually 12,000 crowns for the subsistence of the Spanish garrison in the Goletta. These points being settled, and 20,000 Christian slaves freed from bondage either by arms or by treaty, Charles returned to Europe, where his presence was become necessary; while Barbarossa, who had retired to Bona, recovered new strength, and again became the tyrant of the ocean.

124
Tunis taken, and the inhabitants cruelly massacred.

125
Francis attempts in vain to revive his pretensions to Italy.

The king of France took advantage of the emperor's absence to revive his pretensions in Italy. The treaty of Cambray had repressed but not extinguished the flames of discord. Francis in particular, who waited only for a favourable opportunity of recovering the territories and reputation which he had lost, continued to negotiate against his rival with different courts. But all his negotiations were disconcerted by unforeseen accidents. The death of Clement VII. (whom he had gained by marrying his son the duke of Orleans, afterwards Henry II. to Catharine of Medici, the niece of that pontiff), deprived him of all the support which he hoped to receive from the court of Rome. The king of England, occupied with domestic cares and projects, declined engaging in the affairs of the continent; and the Protestant princes, associated by the league of Smalkalde, to whom Francis had also applied, and who seemed disposed at first to listen to him, filled with indignation and resentment at the cruelty with which some of their reformed brethren had been treated in France, refused to have any connection with the enemy of their religion.

Francis was neither cruel nor bigotted: he was too indolent to concern himself about religious disputes; but his principles becoming suspected, at a time when the emperor was gaining immortal glory by his expedition against the infidels, he found it necessary to vindicate himself by some extraordinary demonstration of reverence for the established faith. The indiscreet zeal of some Protestant converts furnished him with the occasion. They had affixed to the gates of the Louvre and other public places papers containing indecent reflections on the rites of the Romish church. Six of the persons concerned in this rash action were seized; and the king, pretending to be struck with horror at their blasphemies, appointed a solemn procession, in order to avert the wrath of heaven. The holy sacrament was carried through the city of Paris in great pomp: Francis walked uncovered before it, bearing a torch in his hand;

126
His barbarity to the Protestants.

Spain. hand; the princes of the blood supported the canopy over it; the nobles walked behind. In presence of this numerous assembly, the king declared, that if one of his hands were infected with heresy, he would cut it off with the other; "and I would sacrifice (added he) even my own children, if found guilty of that crime." As an awful proof of his sincerity, the six unhappy persons who had been seized were publicly burnt, before the procession was finished, and in the most cruel manner. They were fixed upon a machine which descended into the flames, and retired alternately, until they expired.—No wonder that the Protestant princes were incensed at such barbarity!

127 Causes an army march towards Italy.

Francis, though unsupported by any ally, commanded his army to advance towards the frontiers of Italy, under pretence of chastising the duke of Milan for a breach of the law of nations, in putting to death his ambassador. The operations of war, however, soon took a new direction. Instead of marching directly to the Milanese, Francis commenced hostilities against the duke of Savoy, with whom he had cause to be dissatisfied, and on whom he had some claims; and before the end of the campaign, this feeble prince saw himself stripped of all his dominions, except the province of

128 Geneva throws off the yoke of the duke of Savoy.

Piedmont. To complete his misfortunes, the city of Geneva, the sovereignty of which he claimed, and where the reformed opinions had already got footing, threw off his yoke; and its revolt drew along with it the loss of the adjacent territory. Geneva was then an imperial city, and till lately remained entirely free *.

* See *Geneva*.

In this extremity the duke of Savoy saw no resource but in the emperor's protection; and as his misfortunes were chiefly occasioned by his attachment to the imperial interest, he had a title to immediate assistance. But Charles, who was just returned from his African expedition, was not able to lend him the necessary support. His treasury was entirely drained, and he was obliged to disband his army till he could raise new supplies. Mean time the death of Sforza duke of Milan entirely changed the nature of the war, and afforded the emperor full leisure to prepare for action. The French monarch's pretext for taking up arms was at once cut off; but as the duke died without issue, all Francis's rights to the duchy of Milan, which he had yielded only to Sforza and his descendants, returned to him in full force. He instantly renewed his claim to it; and if he had ordered his army immediately to advance, he might have

129 Charles takes possession of Milan.

made himself master of it. But he unfortunately wasted his time in fruitless negotiations, while his more politic rival took possession of the duchy as a vacant fief of the empire; and though Charles seemed still to admit the equity of Francis's claim, he delayed granting the investiture under various pretences, and was secretly taking every possible measure to prevent him from regaining footing in Italy.

During the time gained in this manner, Charles had recruited his finances, and of course his armies; and finding himself in a condition for war, he at last threw off the mask under which he had so long concealed his designs from the court of France. Entering Rome with great pomp, he pronounced before the pope and cardinals, assembled in full consistory, a violent invective against Francis, by way of reply to his propositions concerning the investiture of Milan. Yet Francis, by an

130 Weakness of Francis.

unaccountable fatality, continued to negotiate, as if it had been still possible to terminate their differences in an amicable manner; and Charles, finding him so eager to run into the snare, favoured the deception, and, by seeming to listen to his proposals, gained yet more time for the execution of his ambitious projects.

131 Charles attempts to subvert the French monarchy,

If misfortunes had rendered Francis too diffident, success had made Charles too sanguine. He presumed on nothing less than the subversion of the French monarchy; nay, he considered it as a certain event. Having chased the forces of his rival out of Piedmont and Savoy, he pushed forward at the head of 50,000 men, contrary to the advice of his most experienced ministers and generals, to invade the southern provinces of France; while two other armies were ordered to enter it, the one on the side of Picardy, the other on the side of Champagne. He thought it impossible that Francis could resist so many unexpected attacks on such different quarters; but he found himself mistaken.

132 But is disappointed in his designs.

The French monarch fixed on the most effectual plan for defeating the invasion of a powerful enemy; and he prudently persevered in following it, though contrary to his own natural temper and to the genius of his people. He determined to remain altogether upon the defensive, and to deprive the enemy of subsistence by laying waste the country before them. The execution of this plan was committed to the mareschal Montmorency its author, a man happily fitted for such a trust by the inflexible severity of his disposition. He made choice of a strong camp, under the walls of Avignon, at the confluence of the Rhone and Durance, where he assembled a considerable army; while the king, with another body of troops, encamped at Valence, higher up the Rhone. Marseilles and Arles were the only towns he thought it necessary to defend; and each of these he furnished with a numerous garrison of his best troops. The inhabitants of the other towns were compelled to abandon their habitations: the fortifications of such places as might have afforded shelter to the enemy were thrown down; corn, forage, and provisions of every kind, were carried off or destroyed; the mills and ovens were ruined, and the wells filled up or rendered useless.

This devastation extended from the Alps to Marseilles, and from the sea to the confines of Dauphiny; so that the emperor, when he arrived with the van of his army on the confines of Provence, instead of that rich and populous country which he expected to enter, beheld nothing but one vast and desert solitude. He did not, however, despair of success, though he saw that he would have many difficulties to encounter; and as an encouragement to his officers, he made them liberal promises of lands and honours in France. But all the land which any of them obtained was a grave, and their master lost much honour by this rash and presumptuous enterprise. After unsuccessfully investing Marseilles and Arles, after attempting in vain to draw Montmorency from his camp at Avignon, and not daring to attack it, Charles having spent two inglorious months in Provence, and lost one half of his troops by disease or by famine, was under the necessity of ordering a retreat; and though he was some time in motion before the enemy suspected his intention, it was conducted with so much precipitation and disorder, as to deserve the name of a flight, since the light troops of France turned it into a perfect rout. The invasion of Picardy

Spain.

Picardy was not more ſucceſsful: the imperial forces were obliged to retire without effecting any conqueſt of importance.

Charles had no ſooner conducted the ſhattered remains of his army to the frontiers of Milan, than he ſet out for Genoa; and unwilling to expoſe himſelf to the ſcorn of the Italians after ſuch a reverſe of fortune, he embarked directly for Spain.

133 Violent animoſity between him and Francis.

Meanwhile Francis gave himſelf up to that vain reſentment which had formerly diſgraced the proſperity of his rival. They had frequently, in the courſe of their quarrels, given each other the lie, and mutual challenges had been ſent; which, though productive of no ſerious conſequences between the parties, had a powerful tendency to encourage the pernicious practice of duelling. Charles, in his invective pronounced at Rome, had publicly accuſed Francis of perfidy and breach of faith; Francis now exceeded Charles in the indecency of his accuſations. The dauphin dying ſuddenly, his death was imputed to poiſon: Montecuculi his cup-bearer was put to the rack; and that unhappy nobleman, in the agonies of torture, accuſed the emperor's generals Gonzaga and de Leyva, of inſtigating him to the deteſtable act. The emperor himſelf was ſuſpected; nay, this extorted confeſſion, and ſome obſcure hints, were conſidered as inconteſtable proofs of his guilt; though it was evident to all mankind, that neither Charles nor his generals could have any inducement to perpetrate ſuch a crime, as Francis was ſtill in the vigour of life himſelf, and had two ſons beſides the dauphin, grown up to a good age.

But the incenſed monarch's reſentment did not ſtop here. Francis was not ſatisfied with endeavouring to blacken the character of his rival by an ambiguous teſtimony which led to the moſt injurious ſuſpicions, and upon which the moſt cruel conſtructions had been put; he was willing to add rebellion to murder. For this purpoſe he went to the parliament of Paris; where being ſeated with the uſual ſolemnities, the advocate-general appeared, and accuſed Charles of Auſtria (ſo he affected to call the emperor) of having violated the treaty of Cambray, by which he was freed from the homage due to the crown of France for the counties of Artois and Flanders; adding, that this treaty being now void, he was ſtill to be conſidered as a vaſſal of France, and conſequently had been guilty of rebellion

134 Charles ſummoned to appear at Paris.

in taking arms againſt his ſovereign. The charge was ſuſtained, and Charles was ſummoned to appear before the parliament of Paris at a day fixed. The term expired; and no perſon appearing in the emperor's name, the parliament gave judgement, that Charles of Auſtria had forfeited, by rebellion and contumacy, the counties of Flanders and Artois, and declared theſe fiefs reunited to the crown of France.

Francis, ſoon after this vain diſplay of his animoſity, marched into the Low Countries, as if he had intended to execute the ſentence pronounced by his parliament; but a ſuſpenſion of arms took place, through the interpoſition of the queens of France and Hungary, before any thing of conſequence was effected: and this ceſſation of hoſtilities was followed by a truce, concluded at Nice, through the mediation of the reigning pontiff Paul III. of the family of Farneſe, a man of a venerable character and pacific diſpoſition.

Each of theſe rival princes had ſtrong reaſons to incline them to peace. The finances of both were exhauſted; and the emperor, the more powerful of the two, was deeply impreſſed with the dread of the Turkiſh arms, which Francis had drawn upon him by a league with Solyman. In conſequence of this league, Barbaroſſa with a great fleet appeared on the coaſt of Naples; filled that kingdom with conſternation; landed without reſiſtance near Taranto; obliged Caſtro, a place of ſome ſtrength, to ſurrender; plundered the adjacent country; and was taking meaſures for ſecuring and extending his conqueſts, when the unexpected arrival of Doria, the famous Genoeſe admiral, together with the pope's galleys and a ſquadron of the Venetian fleet, made it prudent for him to retire. The ſultan's forces alſo invaded Hungary, where Mahmet the Turkiſh general, after gaining ſeveral inferior advantages, defeated the Germans in a great battle at Eſſek on the Drave. Happily for Charles and Europe it was not in Francis's power at this juncture either to join the Turks or aſſemble an army ſtrong enough to penetrate into the Milaneſe. The emperor, however, was ſenſible that he could not long reſiſt the efforts of two ſuch powerful confederates, nor expect that the ſame fortunate circumſtances would concur a ſecond time in his favour; he therefore thought it neceſſary, both for his ſafety and reputation, to give his conſent to a truce: and Francis choſe rather to run the riſk of diſobliging his new ally the ſultan, than to draw on his head the indignation, and perhaps the arms, of all Chriſtendom, by obſtinately obſtructing the re-eſtabliſhment of tranquillity, and contributing to the aggrandizement of the Infidels.

135 Francis leagues with the Turks.

136 A truce concluded.

Theſe conſiderations inclined the contending monarchs to liſten to the arguments of the holy father; but he found it impoſſible to bring about a final accommodation between them, each inflexibly perſiſting in aſſerting his own claims. Nor could he prevail on them to ſee one another, though both came to the place of rendezvous: ſo great was the remains of diſtruſt and rancour, or ſuch the difficulty of adjuſting the ceremonial! Yet, improbable as it may ſeem, a few days after ſigning the truce, the emperor, in his paſſage to Barcelona, being driven on the coaſt of Provence, Francis invited him to come aſhore; frankly viſited him on board his galley, and was received and entertained with the warmeſt demonſtrations of eſteem and affection. Charles, with an equal degree of confidence, paid the king next day a viſit at Aigues-mortes; where theſe two hoſtile rivals and vindictive enemies, who had accuſed each other of every kind of baſeneſs, converſing together with all the cordiality of brothers, ſeemed to vie with each other in expreſſions of reſpect and friendſhip.

137 Interview between Francis and Charles.

138 Advantage gained by the pope from this pacification.

Beſides the glory of having reſtored tranquillity to Europe, the pope gained a point of much conſequence to his family. He obtained for his grandſon, Margaret of Auſtria, the emperor's natural daughter, formerly wife of Alexander de Medici, whom Charles had raiſed to the ſupreme power in Florence. Laurenein de Medici, the kinſman and intimate companion of Alexander, had aſſaſſinated him by one of the blackeſt treaſons recorded in hiſtory. Under pretence of having ſecured him an aſſignation with a lady of the higheſt rank and great beauty, he drew him into a ſecret apartment of his houſe, and there ſtabbed him as he lay careleſsly on a couch, expecting the embrace of the lovely fair, whom he had often

Spain.

often solicited in vain. Laurenein, however, did not reap the fruits of his crime; for though some of his countrymen extolled him as a third Brutus, and endeavoured to seize this occasion for recovering their liberties, the government of Florence passed into the hands of Cosmo II. another kinsman of Alexander. Cosmo was desirous of marrying the widow of his predecessor; but the emperor chose rather to oblige the pope, by bestowing his daughter upon Octavio Farnese, son of the duke of Parma.

139
Charles distressed.

Charles had soon farther cause to be sensible of his obligations to the holy father for bringing about the treaty of Nice. His troops everywhere mutinied for want of pay, and the ability of his generals only could have prevented a total revolt. He had depended, as his chief resource for discharging the arrears due to his soldiers, upon the subsidies which he expected from his Castilian subjects. For this purpose he assembled the Cortes of Castile at Toledo; and having represented to them the great expence of his military operations, he proposed to levy such supplies as the present exigency of affairs demanded, by a general excise on commodities; but the Spaniards, who already felt themselves oppressed by a load of taxes unknown to their ancestors, and who had often complained that their country was drained of its wealth and inhabitants, in order to prosecute quarrels in which they had no interest, determined not to add voluntarily to their own burdens. The nobles, in particular, inveighed with great vehemence against the imposition proposed, as an encroachment on the valuable and distinguishing privilege of their order, that of being exempted from the payment of any tax. After employing arguments and promises in vain, Charles dismissed the assembly with indignation; and from that period neither the nobles nor the prelates have been called to the Cortes, on pretence that such as pay no part of the public taxes should not claim a vote in laying them on. These assemblies have since consisted merely of the procurators or representatives of 18 cities, two from each; in all 36 members, who are absolutely at the devotion of the crown.

140
The Spaniards refuse to assist him with money.

141
Inhabitants of Ghent rebel.

The citizens of Ghent, still more bold, broke out not long after into open rebellion against the emperor's government, on account of a tax which they judged contrary to their ancient privileges, and a decision of the council of Mechlin in favour of the imperial authority. Enraged at an unjust imposition, and rendered desperate on seeing their rights betrayed by that very court which was bound to protect them, they flew to arms, seized several of the emperor's officers, and drove such of the nobility as resided among them out of the city. Sensible, however, of their inability to support what their zeal had prompted them to undertake, and desirous of securing a protector against the formidable forces with which they might expect soon to be attacked, they offered to acknowledge the king of France as their sovereign, to put him into immediate possession of their city, and to assist him in recovering those provinces in the Netherlands which had anciently belonged to his crown. True policy directed Francis to comply with this proposal. The counties of Flanders and Artois were more valuable than the duchy of Milan, for which he had so long contended; and their situation in regard to France made it more easy to conquer or to defend them. But Francis over-rated the Milanese. He had lived in friendship with the emperor ever since their interview at Aigues-mortes, and Charles had promised him the investiture of that duchy. Forgetting, therefore, all his past injuries, and the deceitful promises by which he had been so often duped, the credulous, generous Francis, not only rejected the propositions of the citizens of Ghent, but communicated to the emperor his whole negociation with the malecontents.

142
Extreme credulity of Francis.

Judging of Charles's heart by his own, Francis hoped by this seemingly disinterested proceeding to obtain at once the investiture of Milan; and the emperor, well acquainted with the weakness of his rival, flattered him in this apprehension, for his own selfish purposes. His presence being necessary in the Netherlands, he demanded a passage through France. It was immediately granted him; and Charles, to whom every moment was precious, set out, notwithstanding the remonstrances of his council and the fears of his Spanish subjects, with a small but splendid train of 100 persons. He was met on the frontiers of France by the dauphin and the duke of Orleans, who offered to go into Spain, and remain there as hostages, till he should reach his own dominions; but Charles replied, that the king's honour was sufficient for his safety, and prosecuted his journey without any other security. The king entertained him with the utmost magnificence at Paris, and the two young princes did not take leave of him till he entered the Low Countries; yet he still found means to evade his promise, and Francis continued to believe him sincere.

143
He allows Charles to pass through his dominions.

144
Severity of Charles to the city of Ghent.

The citizens of Ghent, alarmed at the approach of the emperor, who was joined by three armies, sent ambassadors to implore his mercy, and offered to throw open their gates. Charles only condescended to reply, "That he would appear among them as a sovereign and a judge, with the sceptre and the sword." He accordingly entered the place of his nativity on the anniversary of his birth; and instead of that lenity which might have been expected, exhibited an awful example of his severity. Twenty-six of the principal citizens were put to death: a greater number was banished: the city was declared to have forfeited its privileges; a new system of laws and political administration was prescribed; and a large fine was imposed on the inhabitants, in order to defray the expence of erecting a citadel, together with an annual tax for the support of a garrison. They were not only despoiled of their ancient immunities, but made to pay, like conquered people, for the means of perpetuating their own slavery.

145
His base treatment of Francis.

Having thus re-established his authority in the Low Countries, and being now under no necessity of continuing that scene of falsehood and dissimulation with which he had amused the French monarch, Charles began gradually to throw aside the veil under which he had concealed his intentions with respect to the Milanese, and at last peremptorily refused to give up a territory of such value, or voluntarily to make such a liberal addition to the strength of an enemy by diminishing his own power. He even denied that he had ever made any promise which could bind him to an action so foolish, and so contrary to his own interest.

This transaction exposed the king of France to as much scorn as it did the emperor to censure. The credulous simplicity of Francis seemed to merit no other return, after experiencing so often the duplicity and artifices of his rival. He remonstrated, however, and exclaimed as if this had been the firſt circumſtance in which the emperor had deceived him. The inſult offered to his underſtanding affected him even more ſenſibly than the injury done to his intereſt; and he diſcovered ſuch reſentment as made it obvious that he would ſeize on the firſt opportunity of revenge, and that a new war would ſoon deſolate the European continent.

146
He is obliged to make conceſſions to the Proteſtants.

Meanwhile Charles was obliged to turn his attention towards the affairs of Germany. The Proteſtants having in vain demanded a general council, preſſed him earneſtly to appoint a conference between a ſelect number of divines of each party, in order to examine the points in diſpute. For this purpoſe a diet was aſſembled at Ratiſbon: and ſuch a conference, notwithſtanding the oppoſition of the pope, was held with great ſolemnity in the preſence of the emperor. But the divines choſen to manage the controverſy, though men of learning and moderation, were only able to ſettle a few ſpeculative opinions, all points relative to worſhip and juriſdiction ſerving to inflame the minds of the diſputants. Charles, therefore, finding his endeavours to bring about an accommodation ineffectual, and being impatient to cloſe the diet, prevailed on a majority of the members to approve of the following edict of receſs; viz. that the articles concerning which the divines had agreed, ſhould be held as points decided; that thoſe about which they had differed, ſhould be referred to the determination of a general council, or if that could not be obtained, to a national ſynod: and ſhould it prove impracticable alſo to aſſemble a ſynod of Germany, that a general diet of the empire ſhould be called within 18 months, in order to give final judgement on the whole controverſy; that, in the mean time, no innovations ſhould be attempted, nor any endeavours employed to gain proſelytes.

This diet gave great offence to the pope. The bare mention of allowing a diet, compoſed chiefly of laymen, to paſs judgement in regard to articles of faith, appeared to him no leſs criminal and profane than the worſt of thoſe hereſies which the emperor ſeemed ſo zealous to ſuppreſs. The Proteſtants alſo were diſſatisfied with it, as it conſiderably abridged the liberty which they at that time enjoyed. They murmured loudly againſt it; and Charles, unwilling to leave any ſeeds of diſcontent in the empire, granted them a private declaration, exempting them from whatever they thought injurious or oppreſſive in the receſs, and aſcertaining to them the full poſſeſſion of all their former privileges.

The ſituation of the emperor's affairs at this juncture made theſe extraordinary conceſſions neceſſary. He foreſaw a rupture with France to be unavoidable, and he was alarmed at the rapid progreſs of the Turks in Hungary. A great revolution had happened in that kingdom. John Zapol Scæpus, by the aſſiſtance of Solyman, had wreſted from the king of the Romans a conſiderable part of the country. John died, and left an infant ſon. Ferdinand attempted to take advantage of the minority, in order to repoſſeſs himſelf of the whole kingdom; but his ambition was diſappointed by the activity and addreſs of George Martinuzzi, biſhop of Waradin, who ſhared the regency with the queen. Senſible that he was unable to oppoſe the king of the Romans in the field, Martinuzzi ſatisfied himſelf with holding out the fortified towns, all of which he provided with every thing neceſſary for defence; and at the ſame time he ſent ambaſſadors to Solyman, beſeeching him to extend towards the ſon that imperial protection which had ſo generouſly maintained the father on his throne. Ferdinand uſed his utmoſt endeavours to thwart this negotiation, and even meanly offered to hold the Hungarian crown on the ſame ignominious condition by which John had held it, that of paying tribute to the Porte. But the ſultan ſaw ſuch advantages from eſpouſing the intereſt of the young king, that he inſtantly marched into Hungary; and the Germans, having formed the ſiege of Buda, were defeated with great ſlaughter before that city. Solyman, however, inſtead of becoming the protector of the infant ſovereign whom he had relieved, made uſe of this ſucceſs to extend his own dominions: he ſent the queen and her ſon into Tranſilvania, which province he allotted them, and added Hungary to the Ottoman empire.

Happily for the Proteſtants, Charles received intelligence of this revolution ſoon after the diet at Ratiſbon; and by the conceſſions which he made them, he obtained ſuch liberal ſupplies, both of men and money, as left him under little anxiety about the ſecurity of Germany.

147
Undertakes an unſucceſsful expedition againſt Algiers.

He therefore haſtened to join his fleet and army in Italy, in order to carry into execution a great and favourite enterpriſe which he had concerted againſt Algiers: though it would certainly have been more conſiſtent with his dignity to have conducted the whole force of the empire againſt Solyman, the common enemy of Chriſtendom, who was ready to enter his Auſtrian dominions. But many reaſons induced Charles to prefer the African expedition: he wanted ſtrength, or at leaſt money, to combat the Turks in ſo diſtant a country as Hungary; and the glory which he had formerly acquired in Barbary led him to hope for the like ſucceſs, while the cries of his Spaniſh ſubjects rouſed him to take vengeance on their ravagers. But the unfortunate event of this expedition has already been related under the article ALGIERS, N° 14—20.

148
War between Francis and Charles.

The loſs which the emperor ſuffered in this calamitous expedition encouraged the king of France to begin hoſtilities, on which he had been for ſome time reſolved; and an action diſhonourable to civil ſociety furniſhed him with too good a pretext for taking arms. The marquis del Guaſto, governor of the Milaneſe, having got intelligence of the motions and deſtination of two ambaſſadors, Rincon and Fergoſo, whom Francis had diſpatched, the one to the Ottoman Porte, the other to the republic of Venice; knowing how much his maſter wiſhed to diſcover the intentions of the French monarch, and of what conſequence it was to retard the execution of his meaſures, he employed ſome ſoldiers belonging to the garriſon of Pavia to lie in wait for theſe ambaſſadors as they ſailed down the Po, who murdered them and moſt of their attendants, and ſeized their papers. Francis immediately demanded reparation for this barbarous outrage; and as Charles endeavoured to put him off with an evaſive anſwer, he appealed to all the courts of Europe, ſetting forth the heinouſneſs of the injury, the iniquity of the emperor in diſregarding his juſt requeſt, and the neceſſity of vengeance. But Charles, who was a more profound negotiator, defeated in a great meaſure the effects of theſe repreſentations: he ſecured the fidelity of the Proteſtant princes in Germany, by granting them new conceſſions; and he engaged the king of England to eſpouſe his cauſe, under pretence

Spain.

pretence of defending Europe againſt the Infidels; while Francis was only able to form an alliance with the kings of Denmark and Sweden (who for the firſt time intereſted themſelves in the quarrels of the more potent monarchs of the ſouth), and to renew his treaty with Solyman, which drew on him the indignation of Chriſtendom.

But the activity of Francis ſupplied all the defects of his negotiation. Five armies were ſoon ready to take the field, under different generals, and with different deſtinations. Nor was Charles wanting in his preparations. He and Henry a ſecond time made an ideal diviſion of the kingdom of France. But as the hoſtilities which followed terminated in nothing deciſive, and were diſtinguiſhed by no remarkable event, except the battle of Ceriſoles (gained by Count d'Enguien over the imperialiſts, and in which 10,000 of the emperor's beſt

149 Peace concluded at Creſpy.

troops fell), at laſt Francis and Charles, mutually tired of haraſſing each other, concluded at Creſpy a treaty of peace, in which the king of England was not mentioned; and from being implacable enemies, became once more, to appearance, cordial friends, and even allies by the ties of blood.

The chief articles of this treaty were, that all the conqueſts which either party had made ſince the truce of Nice ſhould be reſtored; that the emperor ſhould give in marriage to the duke of Orleans, either his own eldeſt daughter, with the Low Countries, or the ſecond daughter of his brother Ferdinand, with the inveſtiture of the Milaneſe; that Francis ſhould renounce all pretenſions to the kingdom of Naples, as well as to the ſovereignty of Flanders and Artois, and Charles give up his claim to the duchy of Burgundy; and that both ſhould unite in making war againſt the Turks.

The emperor was chiefly induced to grant conditions ſo advantageous to France, by a deſire of humbling the Proteſtant princes in Germany. With the papal juriſdiction, he foreſaw they would endeavour to throw off the imperial authority; and he determined to make his zeal for the former a pretence for enforcing and extending the latter. However, the death of the duke of Orleans before the conſummation of his marriage, diſentangled the emperor from the moſt troubleſome ſtipulation in the treaty of Creſpy; and the French monarch, being ſtill engaged in hoſtilities with England, was unable to obtain any reparation for the loſs which he ſuffered by this unforeſeen event. Theſe hoſtilities, like thoſe between Charles and Francis, terminated in nothing deciſive. Equally tired of a ſtruggle attended with no glory or advantage to either, the contending princes concluded, at Campe, near Ardres, a treaty of peace; in which it was ſtipulated, that France ſhould pay the arrears due by former treaties to England. But theſe arrears did not exceed one-third of the ſums expended by Henry on his military operations; and Francis being in no condition to diſcharge them, Boulogne (a chargeable pledge) was left in the hands of the Engliſh as a ſecurity for the debt.

150 Charles obliged to conclude a diſadvantageous peace with the Turks and Proteſtants.

In conſequence of the emperor's reſolution to humble the Proteſtant princes, he concluded a diſhonourable peace with the Porte, ſtipulating that his brother Ferdinand ſhould pay tribute for that part of Hungary which he ſtill poſſeſſed; while the ſultan enjoyed the imperial and undiſturbed poſſeſſion of all the reſt. At the ſame time he entered into a league with Pope Paul III. for the extirpation of hereſy; but in reality with a view to oppreſs the liberties of Germany. Here, however, his ambition met with a ſevere check; for though he was ſucceſsful at firſt, he was obliged in 1552 to conclude a peace with the Proteſtants on their own terms; as has been related under the article REFORMATION, N° 26—3[illegible].

151 Attempts to recover [illegible] provinces.

By the peace concluded on this occaſion the emperor loſt Metz, Toul, and Verdun, which had formed the barrier of the empire on that quarter; and therefore ſoon after put himſelf at the head of an army, in order to recover theſe three biſhoprics. In order to conceal the deſtination of his army, he gave out, that he intended to lead it into Hungary, to ſecond Maurice in his operations againſt the Infidels; and as that pretext failed him, when he began to advance towards the Rhine, he propagated a report that he was marching firſt to chaſtiſe Albert of Brandenburg, who had refuſed to be included in the treaty of Paſſau, and whoſe cruel exactions in that part of Germany called loudly for redreſs.

152 Is obliged to raiſe the ſiege of Metz.

The French, however, were not deceived by theſe arts. Henry immediately gueſſed the true object of Charles's armament, and reſolved to defend his conqueſts with vigour. The defence of Metz, againſt which it was foreſeen the whole weight of the war would be turned, was committed to Francis of Lorraine, duke of Guiſe, who poſſeſſed in an eminent degree all the qualities that render men great in military command. He repaired with joy to the dangerous ſtation; and many of the French nobility, and even princes of the blood, eager to diſtinguiſh themſelves under ſuch a leader, entered Metz as volunteers. The city was of great extent, ill fortified, and the ſuburbs large. For all theſe defects the duke endeavoured to provide a remedy. He repaired the old fortifications with all poſſible expedition, labouring with his own hands; the officers imitated his example; and the ſoldiers, thus encouraged, cheerfully ſubmitted to the moſt ſevere toils; he erected new works, and he levelled the ſuburbs with the ground. At the ſame time he filled the magazines with proviſions and military ſtores, compelled all uſeleſs perſons to leave the place, and laid waſte the neighbouring country; yet ſuch were his popular talents, as well as his arts of acquiring an aſcendant over the minds of men, that the citizens not only refrained from murmuring, but ſeconded him with no leſs ardour than the ſoldiers in all his operations—in the ruin of their eſtates, and in the havoc of their public and private buildings.

Meanwhile the emperor continued his march towards Lorraine, at the head of 60,000 men. On his approach Albert of Brandenburg, whoſe army did not exceed 20,000 withdrew into that principality, as if he intended to join the French king; and Charles, notwithſtanding the advanced ſeaſon, it being towards the end of October, laid ſiege to Metz, contrary to the advice of his moſt experienced officers.

The attention of both the beſiegers and the beſieged was turned for ſome time towards the motions of Albert, who ſtill hovered in the neighbourhood, undetermined which ſide to take, though reſolved to ſell his ſervice. Charles at laſt came up to his price, and he joined the imperial army. The emperor now flattered himſelf that nothing could reſiſt his force; but he found himſelf deceived. After a ſiege of almoſt 60 days, during

Spain.

ring which he had attempted all that was thought poſſible for art or valour to effect, and had loſt upwards of 30,000 men by the inclemency of the weather, diſeaſes, or the ſword of the enemy, he was obliged to abandon the enterpriſe.

153
Miſerable condition of his army.

When the French ſallied out to attack the enemy's rear, the imperial camp was filled with the ſick and wounded, with the dead and the dying. All the roads by which the army retired were ſtrewed with the ſame miſerable objects; who, having made an effort beyond their ſtrength to eſcape, and not being able to proceed, were left to periſh without aſſiſtance. Happily that, and all the kind offices which their friends had not the power to perform, they received from their enemies. The duke of Guiſe ordered them all to be taken care of, and ſupplied with every neceſſary; he appointed phyſicians to attend, and direct what treatment was proper for the ſick and wounded, and what refreſhments for the feeble; and ſuch as recovered he ſent home, under an eſcort of ſoldiers, and with money to bear their charges. By theſe acts of humanity, leſs common in that age, the duke of Guiſe completed that heroic character which he had juſtly acquired by his brave and ſucceſsful defence of Metz.

154
His further miſfortunes.

The emperor's miſfortunes were not confined to Germany. During his reſidence at Villach, he had been obliged to borrow 200,000 crowns of Coſmo de Medici; and ſo low was his credit, that he was obliged to put Coſmo in poſſeſſion of the principality of Piombino as a ſecurity for that inconſiderable ſum; by which means he loſt the footing he had hitherto maintained in Tuſcany. Much about the ſame time he loſt Sienna. The citizens, who had long enjoyed a republican government, roſe againſt the Spaniſh garriſon, which they had admitted as a check upon the tyranny of the nobility, but which they found was meant to enſlave them; forgetting their domeſtic animoſities, they recalled the exiled nobles; they demoliſhed the citadel, and put themſelves under the protection of France.

To theſe unfortunate events one ſtill more fatal had almoſt ſucceeded. The ſevere adminiſtration of the viceroy of Naples had filled that kingdom with murmuring and diſſatisfaction. The prince of Salerno, the head of the malecontents, fled to the court of France. The French monarch, after the example of his father, applied to the grand ſignior; and Solyman, at that time highly incenſed againſt the houſe of Auſtria on account of the proceedings in Hungary, ſent a powerful fleet into the Mediterranean, under the command of the corſair Dragut, an officer trained up under Barbaroſſa, and ſcarcely inferior to his maſter in courage, talents, or in good fortune. Dragut appeared on the coaſt of Calabria at the time appointed; but not being joined by the French fleet according to concert, he returned to Conſtantinople, after plundering and burning ſeveral places, and filling Naples with conſternation.

155
Is ſucceſsful in the Low Countries.

Highly mortified by ſo many diſaſters, Charles retired into the Low Countries, breathing vengeance againſt France: and here the war was carried on with conſiderable vigour. Impatient to efface the ſtain which his military reputation had received before Metz, Charles laid ſiege to Terouane; and the fortifications being in diſrepair, that important place was carried by aſſault. Heſdin alſo was inveſted, and carried in the ſame manner. The king of France was too late in aſſembling his forces to afford relief to either of theſe places; and the emperor afterwards cautiouſly avoided an engagement.

156
But not ſo in other places.

The imperial arms were leſs ſucceſsful in Italy. The viceroy of Naples failed in an attempt to recover Sienna; and the French not only eſtabliſhed themſelves more firmly in Tuſcany, but conquered part of the iſland of Corſica. Nor did the affairs of the houſe of Auſtria go on better in Hungary during the courſe of this year. Iſabella and her ſon appeared once more in Tranſylvania, at a time when the people were ready for revolt, in order to revenge the death of Martinuzzi, whoſe loſs they had ſeverely felt. Some noblemen of eminence declared in favour of the young king; and the baſhaw of Belgrade, by Solyman's order, eſpouſing his cauſe, in oppoſition to Ferdinand, Caſtaldo, the Auſtrian general, was obliged to abandon Tranſylvania to Iſabella and the Turks.

157
Marriage between Philip of Spain and Mary of England.
An. 1554.

In order to counterbalance theſe and other loſſes, the emperor, in 1554, concerted a marriage between his ſon Philip and Mary of England, in hopes of adding that kingdom to his other dominions. Meanwhile the war between Henry and Charles was carried on with various ſucceſs in the Low Countries, and in Italy much to the diſadvantage of France. The French, under the command of Strozzi, were defeated in the battle of Merciano; Sienna was reduced by Medicino, the Florentine general, after a ſiege of ten months; and the gallant Sienneſe were ſubjected to the Spaniſh yoke. Much about the ſame time a plot was formed by the Franciſcans, but happily diſcovered before it could be carried into execution, to betray Metz to the Imperialiſts. The father guardian, and twenty other monks, received ſentence of death on account of this conſpiracy; but the guardian, before the time appointed for his execution, was murdered by his incenſed accomplices, whom he had ſeduced; and ſix of the youngeſt were pardoned.

While war thus raged in Italy and the Low Countries, Germany enjoyed ſuch profound tranquillity, as afforded the diet full leiſure to confirm and perfect the plan of religious pacification agreed upon at Paſſau, and referred to the conſideration of the next meeting of the Germanic body. During the negociation of this treaty, an event happened which aſtoniſhed all Europe, and confounded the reaſonings of the wiſeſt politicians.

158
Charles reſigns his dominions to his ſon Philip.
An. 1556.

The emperor Charles V. though no more than 56, an age when objects of ambition operate with full force on the mind, and are generally purſued with the greateſt ardour, had for ſome time formed the reſolution of reſigning his hereditary dominions to his ſon Philip. He now determined to put it in execution. Various have been the opinions of hiſtorians concerning a reſolution ſo ſingular and unexpected; but the moſt probable ſeem to be, the diſappointments which Charles had met with in his ambitious hopes, and the daily decline of his health. He had early in life been attacked with the gout; and the fits were now become ſo frequent and ſevere, that not only the vigour of his conſtitution was broken, but the faculties of his mind were ſenſibly impaired. He therefore judged it more decent to conceal his infirmities in ſome ſolitude, than to expoſe them any longer to the public eye; and as he was unwilling

to

to forfeit the fame, or loſe the acquiſitions of his better years, by attempting to guide the reins of government when he was no longer able to hold them with ſteadineſs, he determined to ſeek in the tranquillity of retirement, that happineſs which he had in vain purſued amidſt the tumults of war and the intrigues of ſtate.

In conſequence of this reſolution, Charles, who had already ceded to his ſon Philip the kingdom of Naples and the duchy of Milan, aſſembled the ſtates of the Low Countries at Bruſſels; and ſeating himſelf for the laſt time in the chair of ſtate, he explained to his ſubjects the reaſons of his reſignation, and ſolemnly devolved his authority upon Philip. He recounted with dignity, but without oſtentation, all the great things which he had undertaken and performed ſince the commencement of his adminiſtration. "I have dedicated (obſerved he), from the 17th year of my age, all my thoughts and attention to public objects, reſerving no portion of my time for the indulgence of eaſe, and very little for the enjoyment of private pleaſure. Either in a pacific or hoſtile manner, I have viſited Germany nine times, Spain ſix times, France four times, Italy ſeven times, the Low Countries ten times, England twice, Africa as often; and while my health permitted me to diſcharge the duty of a ſovereign, and the vigour of my conſtitution was equal in any degree to the arduous office of governing ſuch extenſive dominions, I never ſhunned labour, nor repined under fatigue; but now, when my health is broken, and my vigour exhauſted by the rage of an incurable diſtemper, my growing infirmities admoniſh me to retire; nor am I ſo fond of reigning, as to retain the ſceptre in an impotent hand, which is no longer able to protect my ſubjects. Inſtead of a ſovereign worn out with diſeaſes (continued he), and ſcarce half alive, I give you one in the prime of life, already accuſtomed to govern, and who adds to the vigour of youth all the attention and ſagacity of maturer years." Then turning towards Philip, who fell on his knees, and kiſſed his father's hand, "It is in your power (ſaid Charles), by a wiſe and virtuous adminiſtration, to juſtify the extraordinary proof which I give this day of my paternal affection, and to demonſtrate that you are worthy of the extraordinary confidence which I repoſe in you. Preſerve (added he) an inviolable regard for religion; maintain the Catholic faith in its purity; let the laws of your country be ſacred in your eyes; encroach not on the rights of your people; and if the time ſhould ever come when you ſhall wiſh to enjoy the tranquillity of private life, may you have a ſon to whom you can reſign your ſceptre with as much ſatisfaction as I give up mine to you." A few weeks after, he reſigned to Philip the ſovereignty of Spain and America; reſerving nothing to himſelf out of all theſe vaſt poſſeſſions but an annual penſion of 100,000 crowns.

Charles was now impatient to embark for Spain, where he had fixed on a place of retreat; but by the advice of his phyſicians, he put off his voyage for ſome months, on account of the ſeverity of the ſeaſon; and, by yielding to their judgment, he had the ſatisfaction before he left the Low Countries of taking a conſiderable ſtep towards a peace with France. This he ardently longed for; not only on his ſon's account, whoſe adminiſtration he wiſhed to commence in quietneſs, but that he might have the glory, when quitting the world, of reſtoring to Europe that tranquillity which his ambition had baniſhed out of it almoſt from the time that he aſſumed the reins of government.

The great bar to ſuch a pacification, on the part of France, was the treaty which Henry had concluded with the Pope; and the emperor's claims were too 159
numerous to hope for adjuſting them ſuddenly. A truce of five years was therefore propoſed by Charles; during which term, without diſcuſſing their reſpective pretenſions, each ſhould retain what was in his poſſeſſion; and Henry, through the perſuaſion of the conſtable Montmorency, who repreſented the imprudence of ſacrificing the true intereſts of his kingdom to the raſh engagements that he had come under with Paul, authoriſed his ambaſſadors to ſign at Vaucelles a treaty, which would inſure to him for ſo conſiderable a period the important conqueſt which he had made on the German frontier, together with the greater part of the duke of Savoy's dominions.

A truce of five years concluded with France.

The Pope, when informed of this tranſaction, was no leſs filled with terror and aſtoniſhment than rage and indignation. But he took equal care to conceal his fear and his anger. He affected to approve highly of the truce; and he offered his mediation, as the common father of Chriſtendom, in order to bring about a definitive peace. Under this pretext, he appointed Cardinal Rebibo his nuncio to the court of Bruſſels, and his nephew Cardinal Caraffa to that of Paris. The public inſtructions of both were the ſame; but Caraffa, beſides theſe, received a private commiſſion, to ſpare neither intreaties, promiſes, nor bribes, in order to induce the French monarch to renounce the truce and renew his engagements with the holy ſee. He flattered Henry with the conqueſt of Naples; he gained by his addreſs the Guiſes, the queen, and even the famous Diana of Poictiers, ducheſs of Valentinois, the king's miſtreſs; and they eaſily ſwayed the king himſelf, who already leaned to that ſide towards which they wiſhed to incline him. All Montmorency's prudent remonſtrances were diſregarded; the nuncio (by powers from Rome) abſolved Henry from his oath of truce; and that weak prince ſigned a new treaty with the Pope; which rekindled with freſh violence the flames of war, both in Italy and the Low Countries.

160
Quarrel betwixt the Pope and King Philip.

No ſooner was Paul made acquainted with the ſucceſs of this negotiation than he proceeded to the moſt indecent extremities againſt Philip. He ordered the Spaniſh ambaſſador to be impriſoned; he excommunicated the Colonnas, becauſe of their attachment to the imperial houſe; and he conſidered Philip as guilty of high treaſon, and to have forfeited his right to the kingdom of Naples, which he was ſuppoſed to hold of the holy ſee, for afterward affording them a retreat in his dominions.

Alarmed at a quarrel with the Pope, whom he had been taught to regard with the moſt ſuperſtitious veneration, as the vicegerent of Chriſt and the common father of Chriſtendom, Philip tried every gentle method before he made uſe of force. He even conſulted ſome Spaniſh divines on the lawfulneſs of taking arms againſt a perſon ſo ſacred. They decided in his favour; and Paul continuing inexorable, the duke of Alva, to whom

the

Spain. the negotiations as well as the war had been committed, entered the ecclefiaftical ftate at the head of 10,000 veterans, and carried terror to the gates of Rome.

The haughty pontiff, though ftill inflexible and undaunted himfelf, was forced to give way to the fears of the cardinals, and a truce was concluded for 40 days. Mean time the duke of Guife arriving with a fupply of 20,000 French troops, Paul became more arrogant than ever, and banifhed all thoughts from his mind but thofe of war and revenge. The duke of Guife, however, who had precipitated his country into this war, chiefly from a defire of gaining a field where he might difplay his own talents, was able to perform nothing in Italy worthy of his former fame. He was obliged to abandon the fiege of Civetella; he could not bring the duke of Alva to a general engagement; his army perifhed by difeafes; and the Pope neglected to furnifh the neceffary reinforcements. He begged to be recalled; and France ftood in need of his abilities.

Philip, though willing to have avoided a rupture, was no fooner informed that Henry had violated the truce of Vaucelles, than he determined to act with fuch vigour, as fhould convince Europe that his father had not erred in refigning to him the reins of government. He immediately affembled in the Low Countries a body of 50,000 men, and obtained a fupply of 10,000 from England, which he had engaged in his quarrel; and as he was not ambitious of military fame, he gave the command of his army to Emanuel Philibert duke of Savoy, one of the greateft generals of that warlike age.

The duke of Savoy kept the enemy for fome time in fufpenfe with regard to his deftination; at laft he feemed to threaten Champagne; towards which the French drew all their troops; then turning fuddenly to the right, he advanced by rapid marches into Picardy, and laid fiege to St Quintin. It was deemed in thofe times a town of confiderable ftrength; but the fortifications had been much neglected, and the garrifon did not amount to a fifth part of the number requifite for its defence: it muft therefore have furrendered in a few days, if the admiral de Coligny had not taken the gallant refolution of throwing himfelf into it with fuch a body of men as could be collected on a fudden. This he effected in fpite of the enemy, breaking through their main body. The place, however, was clofely invefted; and the conftable Montmorency, anxious to extricate his nephew out of that perilous fituation, in which his zeal for the public had engaged him, as well as to fave a town of fuch importance, rafhly advanced to its relief with forces one half inferior to thofe of the enemy. His army was cut in pieces, and he himfelf made prifoner.

161 The French entirely defeated at St Quintin. An. 1557.

The cautious temper of Philip on this occafion faved France from devaftation, if not ruin. The duke of Savoy propofed to overlook all inferior objects, and march fpeedily to Paris, which, in its prefent confternation, he could not have failed to make himfelf mafter of; but Philip, afraid of the confequences of fuch a bold enterprife, defired him to continue the fiege of St Quintin, in order to fecure a fafe retreat in cafe of any difaftrous event. The town, long and gallantly defended by Coligny, was at laft taken by ftorm; but not till France was in a ftate of defence.

Philip was now fenfible that he had loft an opportunity which could never be recalled, of diftreffing his enemy, and contented himfelf with reducing Horn and Catelet; which petty towns, together with St Quintin, were the fole fruits of one of the moft decifive victories gained in the 16th century. The Catholic king, however, continued in high exultation on account of his fuccefs; and as all his paffions were tinged with fuperftition, he vowed to build a church, a monaftery, and a palace, in honour of St Laurence, on the day facred to whofe memory the battle of St Quintin had been fought. He accordingly laid the foundation of an edifice, in which all thefe were included, and which he continued to forward at vaft expence, for 22 years. The fame principle which dictated the vow directed the building. It was fo formed as to refemble a gridiron—on which culinary inftrument, according to the legendary tale, St Lawrence had fuffered martyrdom. Such is the origin of the famous Efcurial near Madrid, the royal refidence of the kings of Spain.

The firft account of that fatal blow which France had received at St Quintin, was carried to Rome by the courier whom Henry had fent to recal the duke of Guife. Paul remonftrated warmly againft the departure of the French army; but Guife's orders were peremptory. The arrogant pontiff therefore found it neceffary to accommodate his conduct to the exigency of his affairs, and to employ the mediation of the Venetians, and of Cofmo de Medici, in order to obtain peace. The firft overtures of this nature were eagerly liftened to by the Catholic king, who ftill doubted the juftice of his caufe, and confidered it as his greateft misfortune to be obliged to contend with the Pope. Paul agreed to renounce his league with France; and Philip ftipulated on his part, that the duke of Alva fhould repair in perfon to Rome, and after afking pardon of the holy father in his own name and in that of his mafter, for having invaded the patrimony of the church, fhould receive abfolution from that crime. Thus Paul, through the fuperftitious timidity of Philip, finifhed an unpropitious war not only without any detriment to the apoftolic fee, but faw his conqueror humbled at his feet: and fo exceffive was the veneration of the Spaniards in that age for the papal character, that the duke of Alva, the proudeft man perhaps of his time, and accuftomed from his infancy to converfe with princes, acknowledged, that when he approached Paul, he was fo much overawed, that his voice failed, and his prefence of mind forfook him.

162 Peace concluded.

163 Confequences of the war in Italy.

But though this war, which at its commencement threatened mighty revolutions, was terminated without occafioning any alteration in thofe ftates which were its immediate object, it produced effects of confiderable confequence in other parts of Italy. In order to detach Octavio Farnefe, duke of Parma, from the French intereft, Philip reftored to him the city of Piacentia and its territory, which had been feized by Charles V. and he granted to Cofmo de Medici the inveftiture of Sienna, as an equivalent for the fums due to him. By thefe treaties, the balance of power among the Italian ftates was poifed with more equality, and rendered lefs variable than it had been fince it received the firft violent fhock from the invafion of Charles VIII. and Italy henceforth ceafed to be the theatre on which the monarchs of Spain, France, and Germany, contended for fame and dominion. Their hoftilities, excited by new objects, ftained other regions of Europe with blood, and

Spain. and made other ftates feel, in their turn, the miferies of war.

164 The French unfuccefsful in the Low Countries. The duke of Guife, who left Rome the fame day that his adverfary the duke of Alva made his humiliating fubmiffion to the Pope, was received in France as the guardian angel of the kingdom. He was appointed lieutenant-general in chief, with a jurifdiction almoft unlimited; and, eager to juftify the extraordinary confidence which the king had repofed in him, as well as to perform fomething fuitable to the high expectations of his countrymen, he undertook in winter the fiege of Calais. Having taken that place, he next invefted Thionville in the duchy of Luxembourg, one of the ftrongeft towns on the frontiers of the Netherlands; and forced it to capitulate after a fiege of three weeks. But the advantages on this quarter were more than balanced by an event which happened in another part of the Low Countries. The marefchal de Termes governor of Calais, who had penetrated into Flanders and taken Dunkirk, was totally routed near Gravelines, and taken prifoner by Count Egmont. This difafter obliged the duke of Guife to relinquifh all his other fchemes, and haften towards the frontiers of Picardy, that he might there oppofe the progrefs of the enemy.

The eyes of all France were now turned towards the duke of Guife, as the only general on whofe arms victory always attended, and in whofe conduct as well as good fortune they could confide in every danger. His ftrength was nearly equal to the duke of Savoy's, each commanding about 40,000 men. They encamped at the diftance of a few leagues from one another; and the French and Spanifh monarchs having joined their refpective armies, it was expected that, after the viciffitudes of war, a decifive battle would at laft determine which of the rivals fhould take the afcendency for the future in the affairs of Europe. But both monarchs, as if by agreement, ftood on the defenfive; neither of them difcovering any inclination, though each had it in his power, to reft the decifion of a point of fuch importance on the iffue of a fingle battle.

165 Peace concluded between Henry and Philip. During this ftate of inaction, peace began to be mentioned in each camp, and both Henry and Philip difcovered an equal difpofition to liften to any overture that tended to re-eftablifh it. The private inclinations of both kings concurred with their political interefts and the wifhes of their people. Philip languifhed to return to Spain, the place of his nativity, and peace only could enable him, either with decency or fafety, to quit the Low Countries. Henry was now defirous of being freed from the avocations of war, that he might have leifure to turn the whole force of his government towards fuppreffing the opinions of the reformers, which were fpreading with fuch rapidity in Paris and the other great towns, that they began to grow formidable to the eftablifhed church. Court-intrigues confpired with thefe public and avowed motives to haften the negociation, and the abbey of Cercamp was fixed on as the place of congrefs.

While Philip and Henry were making thefe advances towards a treaty which reftored tranquillity to Europe, Charles V. whofe ambition had fo long difturbed it, but who had been for fome time dead to the world,

166 Death of Charles V. ended his days in the monaftery of St Juftus in Eftremadura, which he had chofen as the place of his retreat, as is particularly related under the article CHARLES V.

After the death of Charles, the kingdom of Spain foon loft great part of its confequence. Though Charles had ufed all his intereft to get his fon Philip elected emperor of Germany, he had been totally difappointed; and thus the grandeur of Philip II. never equalled that of his father. His dominions were alfo confiderably abridged by his tyrannical behaviour in the Netherlands. In confequence of this, the United Provinces revolted; 167

Revolt of the United Provinces. and after a long and bloody war obtained their liberty *. In this quarrel Elizabeth of England took part againft Philip, which brought on a war with Spain. The great loffes he fuftained in thefe wars exhaufted the kingdom both of men and money, notwithftanding the great fums imported from America. Indeed the difcovery of that country has much impoverifhed, inftead of enriching Spain; for thus the inhabitants have been rendered lazy and averfe to every kind of manufacture or traffic, which only can 168

Expulfion of the Moors, and its bad confequences to Spain. be a durable fource of riches and ftrength to any nation. The ruin of the kingdom in this refpect, however, was completed by Philip III. who, at the inftigation of the inquifition, and by the advice of his prime minifter the duke of Lerma, expelled from the kingdom all the Morefcoes or Moors, defcendants of the ancient conquerors of Spain. Thirty days only were allowed them to prepare for their departure, and it was death to remain beyond that time. The reafon for this barbarous decree was, that thefe people were ftill Mahometans in their hearts, though they conformed externally to the rites of Chriftianity, and thus might corrupt the true faith. The Morefcoes, however, chofe themfelves a king, and attempted to oppofe the royal mandate; but, being almoft entirely unprovided with arms, they were foon obliged to fubmit, and were all banifhed the kingdom. By this violent and impolitic meafure, Spain loft almoft a million of induftrious inhabitants; and as the kingdom was already depopulated by bloody wars, by repeated emigrations to America, and enervated by luxury, it now fank into a ftate of languor from which it has never recovered.

* See *United Provinces*.

169 Philip IV. An. 1621. The reign of Philip IV. the fucceffor of Philip III. commenced in 1621. He had not been long feated on the throne before the expiration of the 12 years truce which Philip III. had concluded with the United Provinces, again involved Spain in the calamities of war. The renewed conteft was carried on with vigour by both the contending powers, till in the year 1648 the Spanifh monarch was compelled to fign the treaty of Munfter, by which the United Provinces were declared free and

170 Final lofs of the United Provinces. independent. From this period the power of the Spanifh monarchy began to decline, as it had already been feverely fhaken by the lofs of Portugal.

171 Revolt of Portugal. An. 1640. This event took place in 1640, when the Portuguefe finally threw off the Spanifh yoke, and that country remained an independent kingdom, till the power of Bonaparte compelled its lawful monarch to abandon his European territories. Philip IV. alfo profecuted an unfuccefsful war with France. This war was terminated in 1659, and Philip died about fix years after.

172 Charles II. An. 1665. The new monarch, Charles II. was only four years old when he fucceeded to the throne. He was of a feeble conftitution, and a weak capacity. The war which had been occafioned by the revolt of Portugal, continued till the year 1668, when a peace was concluded, and the independence of that kingdom was acknowledged. Hoftilities had been renewed with France, but

Spain.

but greatly to the diſadvantage of the Spaniards, who loſt ſome of the richeſt and beſt fortified towns which they ſtill poſſeſſed in Flanders. The peace of Nimeguen between France and Spain was ſigned in the year 1678. Charles II. died in 1700, and with him ended the male line of the houſe of Auſtria; a dynaſty to which Spain owes leſs than to any other race of its monarchs.

Hiſtorians have been fond of repreſenting the dominion of the Auſtrian princes in Spain as productive of the greateſt glory and advantage to that kingdom. The reign of Charles V. may indeed be ſaid to have been a glorious reign; but little of its glory belonged to Spain, and the emperor certainly neglected her intereſts in advancing thoſe of his more favoured territories. The picture given by the Spaniſh hiſtorians of the ſtate of Spain at the acceſſion and during the reign of Philip II. fully evinces how little that kingdom had profited by the change in the line of its ſucceſſion. Agriculture was neglected; commerce was fettered by enormous duties, and the people were held in the chains of ignorance and ſuperſtition.

173
Acceſſion of the Houſe of Bourbon.
An. 1700.

Charles II. was ſucceeded by Philip V. duke of Anjou, and grandſon to Louis XIV. of France, who had been nominated heir to the Spaniſh throne by the late monarch. The tranſactions of the war which was ſoon declared againſt France and Spain, by England, Holland, and the empire, aſſiſted by Savoy, Portugal, and Pruſſia, have been already related under the article BRITAIN, from N° 345 to N° 371. The treaty of Utrecht, which terminated the differences between the principal contending powers, was ſigned in 1713, and in 1715 a permanent peace was concluded between Spain and Portugal. Hoſtilities, however, ſtill continued with Savoy and Sardinia, and in 1715 the iſland of Sardinia was taken by a Spaniſh fleet, and the year following another fleet belonging to the ſame nation invaded Sicily, but was defeated by the Britiſh admiral Byng. By a new treaty in 1720, Sardinia was given to the duke of Savoy, and Sicily to the emperor; and by the treaty of Seville, concluded in 1729, the duchies of Tuſcany, Parma, and Placentia, were ceded to Spain. In 1731, the Spaniſh king invaded Naples, took poſſeſſion of that kingdom, and conferred it on his ſon Don Carlos, in conſequence of which war was declared between Spain and the empire in 1733. At the end of that year the palace of Madrid was conſumed by fire, and all the archives relating to the Indies periſhed in the flames.

In 1739, hoſtilities were renewed between Spain and Britain, (ſee BRITAIN, N° 403); but the only ſucceſſes acquired by the latter power were the capture of Porto Bello by Admiral Vernon, and that of the Manilla galeon by Commodore Anſon. After a long and turbulent reign, Philip V. died in 1746.

174
Ferdinand VI.
An. 1746.

Ferdinand VI. a mild, prudent, and beneficent prince, reformed abuſes in the adminiſtration of juſtice, and management of the finances. He revived commerce, eſtabliſhed manufactures, and promoted the proſperity of his kingdom. In April A. D. 1755, Quito in South America was deſtroyed by an earthquake.

175
Charles III.
An. 1759.

Charles III. ſucceeded Ferdinand in 1759. The famous family compact was concluded at Verſailles, A. D. 1761, among the four kings of the houſe of Bourbon. The Engliſh, alarmed by the naval preparations of Spain, declared war in 1762 (ſee BRITAIN, N° 450), and took Havannah in the iſland of Cuba, and Manilla in the Eaſt Indies. Notwithſtanding this ſucceſs, peace was haſtily concluded at Fountainbleau, in November, by which the Havannah was reſtored. In 1767 the Jeſuits were expelled from Spain. An unſucceſsful expedition was concerted againſt Algiers, A. D. 1775, the particulars of which are related in M. Swinburne's Travels, letter v. In the war between Great Britain and her American colonies, Spain, by the intrigues of the French court, was prevailed on to take up arms in ſupport of the latter. At the concluſion of that calamitous war, Great Britain in a treaty with Spain, ceded to this power, Eaſt and Weſt Florida, and the iſland of Minorca. Charles died in 1788, and was ſucceeded by his ſecond ſon Charles Anthony prince of Aſturias, the eldeſt having been declared incapable of inheriting the crown.

176
Charles IV.
An. 1788.

Charles IV. had not long been ſeated on the throne before the portentous revolution in France involved Europe in a general ſcene of political and military conteſt. The king of Spain joined the general confederacy againſt the new republic, and in conſequence was numbered among the objects of its reſentment, by a declaration of war in 1793. The military operations of Spain, however, were extremely languid; and after two campaigns, in which ſhe might be ſaid to carry on rather a defenſive than offenſive war, againſt the republican armies (ſee FRANCE, N° 411), ſhe was compelled to conclude a treaty of peace, which was ſigned at Baſil on the 22d July 1795. By this treaty the French republic reſtored to the king of Spain all the conqueſts which ſhe had made from him ſince the commencement of hoſtilities, and received in exchange all right and property in the Spaniſh part of St Domingo.

177
Engages in the confederation againſt France
An. 1793.

178
War between Spain and Britain.
An. 1796.

This treaty was ſoon followed by a rupture with Great Britain. On 5th October 1796, the court of Spain publiſhed a manifeſto againſt this country, to which the court of London made a ſpirited reply; and about the ſame time was publiſhed a treaty of offenſive and defenſive alliance, which had been concluded about two months before, between the king of Spain and the French republic. In the war which followed between Spain and Great Britain, his Catholic majeſty could boaſt of but little honour or ſucceſs; and the French republic gained little from its new ally, but the contributions of money, which ſhe from time to time compelled him to advance. On the 14th of February 1797, a Spaniſh fleet of 27 ſail of the line was defeated by Sir John Jervis off Cape St Vincent (ſee FRANCE. N° 482); and four of the Spaniſh line of battle ſhips were left in the hands of the victors. From this time till the temporary termination of hoſtilities by the peace of Amiens in 1802, there is nothing remarkable in the tranſactions of Spain. An. 1797.

On the renewal of the war in 1803, Spain was again compelled, by the overbearing power of France, to take an active part againſt Great Britain, and fitted out a formidable fleet, which was united to a conſiderable naval force of the new-made emperor of the French. The Spaniſh declaration of war againſt Britain is dated at Madrid on the 12th of December 1804; and on the 21ſt of October 1805, the combined fleets of France and Spain were nearly annihilated by Lord Nelſon's deciſive victory off Cape Trafalgar. An. 1803. An. 1805.

After this terrible blow to the naval power of Spain, nothing

nothing of importance took place till 1808, when the deſigns of Bonaparte againſt the independence of Spain, which had been long ſuſpected, were openly avowed, in conſequence of a domeſtic diſpute, probably fomented by the emiſſaries of France, which took place between Charles IV. and the prince of Aſturias. During the winter of 1807-8 the public mind in Spain had been greatly agitated. Some accuſed the prince of the Peace, Don Manuel Godoy, (who had long held the helm of ſtate, and was the richeſt and moſt powerful ſubject in the kingdom), of having concerted with the queen to deſtroy the prince of Aſturias. Others accuſed the prince of Aſturias of being at the head of a party to dethrone his father. Solemn councils and long proceedings, followed up by exiles and violent acts, far from calming opinions, ſerved to agitate them ſtill more.

179 Revolution in favour of the prince of Aſturias. An. 1808.

In March 1808, ſeveral diſturbances happened at Aranjuez. Theſe diſturbances were excited by a report that the royal family were about to quit Spain and emigrate to America. In conſequence of this report, the populace of the neighbouring villages repaired in crowds to Aranjuez, where they found the attendants of the court packing up the baggage of the royal houſehold; and underſtood that relays of horſes were ſtationed on the road to Seville, and that every thing was prepared for the departure of the royal fugitives, who were to take ſhipping at that port. It was ſuſpected that Don Manuel Godoy, or, as he has commonly been called, the prince of the Peace, was the chief inſtigator of this unpopular meaſure; and the fury of the people was directed chiefly againſt that nobleman, whoſe palace they attacked on the 18th of March. He, however, found means to eſcape for the preſent, but was afterwards arreſted in a garret of his own houſe. In the mean time the king iſſued two decrees with a view to allay the popular ferment; but as this ſtill continued, he on the 19th took the extraordinary reſolution of abdicating the throne in favour of the prince of Aſturias. This reſolution was made known by a royal decree, in which Charles declared that, as his natural infirmities no longer permitted him to ſupport the weight of government, and the re-eſtabliſhment of his health required a change of climate, he had after the moſt mature deliberation reſolved to abdicate his crown in favour of his heir the prince of Aſturias; and this reſolution he declared to be the reſult of his own free will.

180 Ferdinand VII.

The new ſovereign was accordingly proclaimed by the title of Ferdinand VII. and iſſued an edict confiſcating the effects of Don Manuel Godoy, and announcing the appointment of the duke of Infantado, a nobleman deſervedly popular for his talents and virtues, to the preſidency of Caſtile and the command of the royal guards.

Theſe diſturbances have commonly been attributed to the machinations of the French emperor, who had gained a complete aſcendency over the weak Charles; and had rendered the prince of the Peace entirely ſubſervient to the views which he had formed on the independence and the liberties of Spain. How far this ſuppoſition is correct, it is impoſſible for us at this time to determine; but it is rendered probable by the active meaſures taken about this time by Napoleon to awe by a French force the Spaniſh nation. Murat the grand duke of Berg was at this time on his march towards the capital with a body of French troops; and his march was haſtened by the information which he had received of the tumults at Aranjuez. This general cauſed it to be intimated to Ferdinand, that the emperor of the French was on his journey to Spain, and adviſed him to meet his maſter on the road. In the mean time he was tampering with the ſelf-depoſed monarch, whom he aſſured of the aſſiſtance of Bonaparte in reinſtating him on the throne. Charles accordingly addreſſed a letter to Bonaparte, in which he contradicts the aſſertion of his decree of the 19th; and declares that his abdication was a meaſure of compulſion; and throws himſelf on the protection of that great monarch, his friend and ally, from whom alone he and his ſubjects can hope to derive tranquillity and happineſs. 181

Deſigns of Bonaparte on the independence of Spain.

It appears to have been the deſign of Murat to draw out of Spain the whole of the royal family, and in this deſign he completely ſucceeded. Ferdinand ſet out to meet Bonaparte, accompanied by the French general Savary, and had advanced as far as Vittoria, where he was left by Savary, and where he found himſelf ſurrounded by French troops. He was compelled to remain at Vittoria, until Savary, who had proceeded to Bayonne, where Bonaparte then was, ſhould return and intimate to him the pleaſure of his maſter. When the general returned, he brought with him a letter from Napoleon to Ferdinand. In this letter, which is addreſſed to Ferdinand as prince of Aſturias, and not as king of Spain, Bonaparte aſſured the prince, that the ſole object of his journey into Spain was to make ſuch reforms in that kingdom as would be agreeable to the public feelings. Without pretending to judge reſpecting the late revolution, he cautions Ferdinand againſt the danger to be apprehended from ſovereigns permitting their ſubjects to take juſtice into their own hands. After inſinuating his own power over the royal family of Spain, and adverting to the tumults that had taken place, in which ſome of his troops had fallen, he makes uſe of the following expreſſion, "a few of my ſoldiers may be murdered; but the ſubjugation of Spain ſhall be the conſequence of it."

Ferdinand confounded at the conduct of the French emperor, and alarmed for his own perſonal ſafety, was compelled to proceed on his journey. When he arrived at Bayonne he was received by the prince of Neufchatel and Duroc, and was conducted to a place by no means ſuited to his rank or his character as ally of Bonaparte. He however dined with the emperor; but after he had retired, General Savary brought a meſſage from his maſter, intimating his determination that the preſent royal family of Spain ſhould give up to him all right and title to the crown of that kingdom, and that they ſhould be ſucceeded by a branch of his own family. Aſtoniſhed at this intimation, Ferdinand ſent his prime miniſter Cevallos, to canvaſs the matter with M. Champagny, the confidential ſecretary of Napoleon. The conference was held in an apartment adjoining the cabinet of the emperor, and, as it appeared, within his hearing: for when Cevallos was arguing with great warmth and ſtrength of reaſoning on the injuſtice and even impolicy of the propoſed meaſures, both he and Champagny were ordered into the emperor's preſence; and the former was reviled in the groſſeſt terms, branded with the appellation of a traitor, accuſed of having maintained that the recognition of Bonaparte was not neceſſary to the validity of his maſter's title to the throne of Spain, and of

 having

Spain. having affirmed that if the French dared to attack the independence of the Spanish monarchy, three hundred thousand men would rise to defend it and repel the invaders. After Napoleon had thus indulged the violence of his temper, he entered in a harsh and arrogant style on a discussion of the points in dispute between his secretary and Cevallos; and finding that he could neither convince nor silence the Spanish minister, he abruptly concluded with the following peremptory declaration: "I have a system of policy of my own; you ought to adopt more liberal ideas, to be less susceptible on the point of honour, and not sacrifice the prosperity of Spain to the interest of the House of Bourbon." From this time the destiny of the Spanish royal family was fixed. Ferdinand the monarch of the people's choice was already a captive, and not many days elapsed before the rest of the royal family was in the same situation. On the first of May, Ferdinand had made a conditional renunciation of his crown in favour of his father, and on the fifth of the same month Bonaparte had a long conversation with Charles the fourth and his queen. Ferdinand was called in by his father, to hear, in the presence of him and the queen, the disgusting and humiliating expressions which were uttered by the French emperor, expressions of such a nature, that Cevallos says he dares not record them. All the parties were seated except Ferdinand; he was ordered by his father to make an absolute renunciation of the crown, on pain of being treated as an usurper and a conspirator against the right of his parents. With this requisition Ferdinand complied, and thus completed the abdication of his family; for it appeared that on the preceding day Charles had executed the deed of resignation, which transferred to the emperor of the French his title to the crown of Spain, on consideration of receiving during his life an annuity of eighty millions of reals, of a dowry to his queen of two millions of reals, and to the infantes of Spain the annual sum of four hundred thousand livres.

Thus had Bonaparte effected the transference of the Spanish nation from the Bourbon dynasty to his own family, so far at least as that transference could be effected by the formal renunciation in his favour of the royal family, and by a strong but suspicious recommendation from them to the Spanish nation to receive their new sovereign, whoever he should be, with submission and obedience. Filled as the annals of mankind are with examples of treachery, perfidy, and violence, it would be difficult to point out a deed which in every part of its performance, in its own nature, or in the character of the means by which it was effected, bears such strong marks of unjust and lawless tyranny.

It was soon understood that Napoleon designed the crown of Spain for his brother Joseph, who had some time before been placed on the throne of Naples. In an address to the Spanish nation, which Bonaparte published immediately after the abdication of Charles and Ferdinand, he informed them that he did not mean to reign over them in person, but that he would give them a sovereign every way resembling himself. In the beginning of June Joseph Bonaparte arrived in the neighbourhood of Bayonne, where he was received by a deputation of the grandees of Spain and from the council of Castile, and presented with a congratulatory address, written in the most fulsome style of adulation, on his accession to the Spanish throne.

But though the nomination of Joseph Bonaparte was easily effected, it was not so easy to place him on the throne in opposition to the almost unanimous will of the Spanish nation. Ferdinand the seventh was the darling of the people; and his accession to the crown had been hailed by them, both as placing them under the dominion of a beloved monarch, and as releasing them from the tyranny of Godoy, who was an object of almost universal detestation. They had hitherto submitted with patience to the influence and power of France, hopeless of rescuing themselves while Charles possessed the throne, and while the prince of the Peace directed his councils; but the accession of Ferdinand, and the consequent disgrace of the favourite, had led them to hope that they should now find a sovereign willing to direct and assist their efforts to regain their independence. Under these expectations, a great part of the nation had come forward to offer their assistance in supporting the claims of the new monarch. The province of Catalonia, the most industrious and the most warlike of the Spanish nation, particularly distinguished itself by the promptitude and extent of its offers. Soon after Ferdinand had ascended the throne, the captain-general of Catalonia, relying on the well known resources and dispositions of the inhabitants, had come forward with an offer of a military force of above a hundred thousand men; and other provinces would have followed this example, but Ferdinand had discouraged these military preparations, and appeared willing to submit quietly to French bondage.

182
Opposed by a general insurrection of the Spaniards.

The spirit which had animated the Spaniards thus boldly to support their favourite sovereign, was not of a nature to be chilled and repressed by his timidity or example. The hatred which they had conceived against the French daily found fresh sources of nourishment. They saw Ferdinand, who had rejected their proffered services lest he should expose himself to the suspicion or displeasure of Bonaparte, enticed by deceit, or compelled by violence, to relinquish his kingdom and commit himself to the power of his enemy. They anticipated the consequences, and prepared to resist them with vigour and unanimity. The renunciation of the royal family in favour of Bonaparte was no sooner known in Spain, than the northern provinces burst into open insurrection. Asturias and Gallicia set the glorious example; and it was soon followed by almost every part of Spain, not immediately occupied or overawed by the armies of France.

One of the first steps taken by the leaders of the insurrection was, to assemble the juntas or general assemblies of the provinces. When these were organized, they issued proclamations, calling on the Spaniards to rise in defence of their sovereign, and in the assertion of their own independence. Besides these proclamations from the provincial juntas, addresses were published in almost every province by the leaders of the popular cause; in particular, the province of Aragon was addressed by Palafox, a name celebrated in the annals of the Spanish revolution, in a bold and spirited manifesto. The junta of Seville, which assembled on the 27th of May, formed itself into a supreme junta of government, caused Ferdinand to be proclaimed king of Spain, took possession of the military stores, and issued an order for all males from 16 to 45, who had not children, to enroll themselves in the national armies.

It was natural that, when entering on so determined an an oppofition to the meafures of Bonaparte, the Spaniards fhould turn their eyes towards that nation, by whom alone the ambitious views of that potentate had been fuccefsfully combated. A peace and alliance with Britain was evidently not only a meafure of policy, but would afford them the moft effectual affiftance in the formidable ftruggle in which they were about to engage. Accordingly, deputies were difpatched to Great Britain from feveral of the provinces, to folicit the aid and friendfhip of that country, and to concert meafures with the Britifh miniftry for executing the plans which had been contrived for freeing the kingdom from the French yoke. The junta of Seville iffued a declaration of war with France, and declared the Spanifh nation on terms of peace and amity with Britain. The Spanifh deputies were empowered to folicit fupplies of arms, ammunition, clothing and money; but it was thought that a fupply of Britifh troops would be unneceffary, the Spanifh patriots confidering themfelves as fully equal to the defence of their country. The caufe of the Spanifh patriots was eagerly embraced by the court of London, and by the Britifh nation at large, and the moft active meafures were quickly taken to fend them effectual aid.

183 Peace and alliance with Britain.

184 Statement of the French and Spanifh forces.

While thefe preparations were making on the part of the Spaniards, the French forces were collecting in great numbers, both on the frontiers, and in the neighbourhood of the capital. Above 25,000 men, under the command of Beffieres and Laffoles, threatened the provinces of Afturias and Bifcay, or occupied the plains of Caftile. Ten thoufand men were fhut up in the citadel of Barcelona; and to relieve them, a ftrong body of French troops had marched from the frontiers, and laid fiege to Zaragoza. A confiderable body under General Moncey attacked the city of Valencia; while the grand duke of Berg, after having detached General Dupont at the head of 20,000 men, to quiet the infurrection of the fouthern provinces, held Madrid with about 15,000 troops. Junot, with about 25,000 men, had entered Portugal, and taken poffeffion of the capital. The whole French force at this time in Spain cannot be computed at lefs than 100,000 men. Thefe were oppofed by a very numerous, but undifciplined force, commanded by generals of acknowledged bravery, but differing widely from each other in experience and military prudence. General Palafox commanded in Aragon; General Caftanos in the fouthern provinces; and General Blake in the north.

185 Succeffes of the Spanifh patriots.

The firft exertions of the Spanifh patriots were eminently fuccefsful, though they have been greatly exaggerated in the newfpapers publifhed under authority of the juntas. The harbour of Cadiz, which contained a numerous and well-appointed fleet, was under the command of the marquis de Solano, a man notorioufly attached to the French intereft; and here lay a French fleet, confifting of five fhips of the line and a frigate. One of the firft efforts of the patriots was, to obtain poffeffion both of Cadiz and the French fleet, and in this they completely fucceeded. Solano was arrefted and put to death, and Don Morla was appointed in his room. In the beginning of June the French fleet was fummoned to furrender, and on the admiral's refufal, was furioufly attacked by the batteries on fhore, and obliged to capitulate. The force detached by Murat, under Dupont, was attacked near Baylen, on the 22d July, by Major-general Reding, fecond in command under Caftanos, and after having been defeated, was compelled to furrender at difcretion. The French force befieging Zaragoza, was repeatedly attacked by General Palafox, and fuffered confiderable loffes, while that city held out with the moft heroic bravery. Perhaps there are few inftances in the annals of modern warfare, in which fuch perfevering and fuccefsful courage has been difplayed, as by the defenders of Zaragoza. All the means of attack which were in poffeffion of the French, directed by the fkill with which their long experience and fuccefs had fupplied them, were made ufe of. The inhabitants were obliged continually to be upon their guard, and to be prepared to refift the moft unexpected and fecret, as well as the moft open and violent affaults. The city was frequently bombarded in the middle of the night, at the fame time that the gates were attempted to be forced, under cover of the fhells. More than once the French got into fome parts of the town; but they were received with fo much coolnefs and bravery, that they were never able to preferve what they had with fo much difficulty and lofs acquired. The women vied with their hufbands, fons, and brothers, in the difplay of patriotifm and contempt of danger: regardlefs of the fire of the enemy, they rufhed into the very middle of the battle, adminiftering fupport and refrefhment to the exhaufted and wounded, and animating, by their exhortations and example, all ranks to fuch a difplay of firmnefs and bravery as long fecured this important city. When it is recollected, that the attacks of the French were numerous and varied, that they were conftantly repeated with frefh, and generally with increafing forces, and that the fole defence of the city refted with its fpirited inhabitants and the army of Palafox; fome idea may be formed of the difficulties they muft have undergone and furmounted, and of the glory to which they are fo juftly entitled. The patriots had gained poffeffion of moft of the fea ports in the bay of Bifcay, and headed by the bifhop of St Andero, repulfed the French in feveral attacks. The French force under General Moncey was alfo repulfed before Valencia, and the patriots were equally fuccefsful in feveral other quarters; fo that by the end of July there did not remain above 40,000 French forces within the Spanifh territory.

186 Arrival and flight of Jofeph Bonaparte.

In the meantime preparations were making at Madrid for the reception of the new fovereign Jofeph; and Murat, under pretence of ill health, quitted the capital, to give way to the brother of his mafter. Jofeph Bonaparte arrived at Madrid in the latter end of July, with a guard of 10,000 men; but foon after his arrival the news of the defeat and capitulation of Dupont reached Madrid, and threw the new court into the utmoft confternation. They underftood that the victorious army of Caftanos was on its march towards the capital; and if he did not fpeedily retire from fo dangerous a pofition, King Jofeph dreaded either falling into the hands of the conqueror of Dupont, or of being intercepted in his retreat by the army of General Blake. In this fituation he found himfelf under the neceffity of quitting the capital which he had fo lately entered, and before the end of the month he had reached Burgos in his precipitate flight towards the frontiers. Thus, within the fpace of two months, did the people of Spain behold their country almoft entirely freed from the prefence of the French; and this glorious and happy iffue had been brought about by their own intrepidity. At a time when their fituation was the moft difpiriting and forlorn;

Spain. lorn; when their king had been compelled to forfake them, and to make over his right to the throne to a foreign potentate; when they beheld fcarcely any troops furrounding them on all fides, but thofe of that potentate, they rofe in arms, and oppofed themfelves, unfkilled as they were in war, and totally unprepared for it, to a man before whom the mightieft empires in Europe had fallen.

187 Reverfes. The fucceffes of the Spanifh arms, though brilliant and important, were but tranfient. The leaders of the infurrection appear to have been but ill calculated to oppofe the fyftem of tactics which had been fo often practifed with fuccefs by the conqueror of Marengo, of Jena, and of Aufterlitz. Though the conquefts of Auftria and Pruffia had been effected by the fame fyftem which the French were now purfuing in Spain, the military men of this kingdom were incapable of analyzing them, or of adopting effectual meafures of oppofition or defence. In a feries of about 30 bulletins, publifhed from the French army of Spain, comprehending from the beginning of November 1808 to the middle of January 1809, we read of nothing but the rapid movements and fucceffes of the French, and the defeat and annihilation of the beft appointed armies of the infurgents. In Gallicia, General Blake, after having withftood the duke of Dantzick (Marfhal Ney), in feveral encounters, was at length defeated, and his army difperfed. A divifion of the army of Eftremadura, under Count Belvider, which had marched from Madrid to fupport the city of Burgos, was attacked and defeated by a divifion of the French army under the dukes of Iftria and Dalmatia; while the army of General Caftanos was in a great meafure difperfed, after a fevere conflict on the heights of Tudela. According to the French account, the army of Caftanos confifted of 45,000 men. It was oppofed by the duke of Montebello, and entirely defeated, with the lofs of nearly 4000 killed, and 5000 taken prifoners.

In the meantime Bonaparte had entered Spain, and taken the command of the French army. He advanced by rapid marches towards Madrid, and at the end of November his advanced guard reached the important pafs of Somofierra. This pafs was defended by a body of 13,000 Spaniards, with fixteen pieces of cannon. They were attacked by the French under the duke of Belluno, and after making a confiderable ftand, were entirely defeated. On the 2d of December Bonaparte arrived in the neighbourhood of Madrid, and on the 5th he was mafter of that capital.

188 Britifh expeditions in fupport of the Spanifh patriots. While the Spanifh patriots were thus purfuing their plan of oppofition to French tyranny with various fuccefs, the Britifh cabinet were fitting out formidable expeditions to the coafts of Spain and Portugal. The refult of the expedition under Sir Harry Burrard and Sir Arthur Wellefley, the battle of Vimiera, the convention of Cintra, and the confequent evacuation of Portugal by the French, in the month of Auguft 1808, have been already noticed under Portugal, N° 49 and 50. After thefe tranfactions, the greater part of the Britifh army under the command of Lieutenant-general Sir John Moore, proceeded on their march to the frontiers of Spain. The progrefs and operations of this army will be detailed mentioned. About the middle of the fame month, a body of 13,000 Britifh troops, under the command of Sir David Baird, arrived at Corunna, and proceeded through the interior of the country, intending to join Sir John Moore in the neighbourhood of Madrid. A brigade of 10,000 men under General Hope, reached that capital, and eftablifhed themfelves at the Efcurial; but on the approach of Bonaparte, were under the neceffity of retiring.

189 March of Sir John Moore to Sahagun. Experience has fhown that in their military campaigns on the continent, Britifh forces have to contend with numerous difficulties, furmountable only by the utmoft prudence and vigilance on the part of the commanding officers, and by a confiderable degree of fkill and forefight on that of the projectors of fuch undertakings. Never perhaps were thefe difficulties more feverely felt than in the march of Sir John Moore from Portugal to the centre of the Spanifh territory. It was found that in whatever direction he might profecute his march, he would encounter either bad roads or fcanty fupplies of provifions. In particular, the difficulty of tranfporting the artillery over the Portuguefe mountains was extreme; and the Portuguefe at Lifbon were either egregioufly ignorant of the ftate of the roads which led through their own country to the Spanifh frontiers, or were unwilling to communicate the information which they really poffeffed. Under thefe circumftances it was found neceffary to divide the Britifh army; and it was determined to fend forward one divifion confifting of 6000 men under the command of Lieutenant-General Hope, which was directed to march by Elvas, to enter Spain by Badajos, and to proceed along the Madrid road by way of Efpinar. Another divifion, confifting of two brigades under General Paget, was detached by way of Elvas and Alcantara, where it was to pafs the Tagus. Two brigades under General Beresford moved through Portugal by way of Coimbra and Almeyda towards Salamanca, while three brigades under General Frafer marched towards the frontiers of Spain by Abrantes and Almeyda.

Burgos had been recommended by the Spanifh government as the point of union for the Britifh troops, and Madrid and Valladolid were appointed for magazines. The Britifh had been led to expect that they would find between 60,000 and 70,000 Spaniards affembled under General Blake and the marquis de la Romana in the provinces of Afturias and Gallicia, and that a much greater number was ready to co-operate with them under the command of Caftanos on the front and left of the principal French pofition. The Spaniards had been reprefented as unanimous in their enthufiafm for the caufe of liberty, and as ready to treat the Britifh troops as the faviours of their country. How far this information was correct, will be feen prefently.

In marching through the Portuguefe territory, the troops firft encountered difficulties which they were not prepared to expect. The contractor at Lifbon, who had agreed to fupply the divifions with rations on the march, failed in his contract, and exceffive inconvenience was experienced from the want of money. The divifions under Generals Frafer and Berefford were obliged to halt, and it was fome time before they could again fet forward. The proceedings of the central junta, on which all the movements both of the Britifh and Spanifh armies chiefly depended, were languid, tardy, and irrefolute; and before the Britifh troops could affemble in any force in Spain, the principal armies of the patriots had been defeated and difperfed in almoft

every

Spain. every quarter. On the 8th of November Sir John Moore reached Almeyda. The weather was at this time extremely unfavourable, and the troops were exposed to almost incessant rain. They entered Spain on the 11th of November, and on the 13th Sir John arrived with his advanced guard at Salamanca, where he halted, intending to assemble there all the troops which were on their march through Portugal. While he remained at Salamanca, he was informed that a considerable French force had advanced and taken possession of Valladolid, at the distance of only twenty leagues, by which one of the places that had been intended for magazines was lost. At this time Sir John had with him only three brigades of infantry without artillery, and it would be at least ten days before the whole of the divisions could come up. He was thus exposed to almost an immediate attack by the French without any effectual support from the boasted patriotism of the Spaniards.

The situation of affairs in Spain had now become extremely critical; and every account sent to Sir John Moore by men of sound judgement, was filled with convincing proofs that the Spanish government had concealed from their ally the very desperate state of their affairs. General Hope, by a long and tiresome march, had reached the neighbourhood of Madrid, whence he wrote a letter to Sir John, stating that every branch was affected by the disjointed and inefficient construction of the government. On the 28th of November Sir John was advertised of the late defeat and dispersion of Castanos, and of the little probability there was of his being able to march forward, so as to effect any thing of advantage. He therefore determined to fall back, though this determination was evidently in opposition to the wishes and advice of his officers. Fresh dispatches, however, from the seat of government, diminishing the losses which had been sustained by the patriots, and exaggerating the ardour with which the people were actuated, induced him to delay his retreat, especially as he had now a complete, though small corps, with cavalry and artillery, and could, by a movement to the left, easily effect a junction with Sir David Baird, while the division under General Hope had, by rapid marches, arrived in the neighbourhood of Salamanca.

In addition to the misrepresentations by which the commanders of the British forces, and the British envoy at Aranjuez, had been deceived, they had now to contend with two designing men, who, it soon appeared, were in the French interest. These were Don Morla, the late governor of Cadiz, and a M. Charmilly. By the machinations of these men, Mr Frere was led to advise, and Sir John Moore strongly incited to undertake, bringing the whole of the British force to the neighbourhood of Madrid, where they would soon have been completely within the power of the enemy. Though by these arts Sir John was effectually misled, he did not suffer himself to be drawn into so dangerous a snare. He, however, advanced beyond Salamanca, and sent forward the reserve and General Beresford's brigade towards Toro on the Douro, where they were to unite with the cavalry under Lord Paget, who had advanced thither from Astorga. On December 12th, Lord Paget, with the principal part of the cavalry, marched from Toro to Tordesillas, while the brigade under General Stewart moved from Arivolo. In the vicinity of Tordesillas, near the village of Rueda, the British forces were first opposed by the French, a small party of whom were attacked and defeated.

While Sir John Moore was at Toro, he received intelligence that the duke of Dalmatia was at Saldana with a considerable body of French troops, that Junot, duke of Abrantes, was marching with another towards Burgos, and that a third under the duke of Treviso was destined for Zaragoza. He was very desirous that the first of these generals should advance to meet him, and with this view he had come forward to Toro, which he reached on the 16th of December. He had hoped for effectual assistance from the corps commanded by the marquis de la Romana, but he soon found that this general could render him no support. He had now resolved to threaten the communication between France and Madrid; and, if a favourable opportunity offered, to attack the duke of Dalmatia's corps, or any of the covering divisions that should present themselves. He foresaw that this would necessarily draw upon him a large French force, and of course would prove an important diversion in favour of the Spaniards; who would by this means have the opportunity of collecting in the south, and restoring their affairs. The army was now near the French position. The cavalry under Lord Paget were pushed so forward, that their patrols reached as far as Valladolid, and had frequent succesful skirmishes with the enemy. Colonel Otway met a detachment of French cavalry, charged them, and made the whole prisoners.

On the 18th of December, Sir John's head-quarters were at Castro Nuevo, and Sir David Baird's at Benevente, on the road to join him. On the 20th Sir John reached Majorga, where he was joined by Sir David Baird. The united British army now amounted to rather fewer than 26,000 men, of whom about 2000 were cavalry. The weather was extremely cold, and the ground covered with deep snow. Still the exertions of the troops were indefatigable, and the cavalry in particular attacked and defeated a considerable body of French horse. On the 21st the army reached Sahagun, where Sir John established his head-quarters, and determined to halt for some time, to refresh his troops, after the fatigues which they had undergone.

Sir John had now arrived within a very short distance from Saldana, where the duke of Dalmatia was posted, with the flower of the French army; and preparations were made for an attack, which was waited for with all the ardour and impatience which distinguish British troops. In the mean time, however, repeated couriers arrived at head-quarters, the bearers of unpleasant intelligence. Certain information was received, that a strong French reinforcement had arrived at Carrion, a little to the right of Sahagun, that the French corps, which was marching to the south, had halted at Talavera, and that the enemy were advancing from Madrid in considerable force. Sir John now saw that his motions had been watched by Bonaparte, and that all the arts of this experienced general had been preparing to entrap him. To advance was madness; to retreat, almost in the face of an enemy, was a measure of the utmost danger, but it was the only alternative. 120

His retreat. On the 24th of December Sir John began silently and secretly to prepare for his retreat, and to provide, as far as possible, for the defence of those parts of the country

Spain.

country which were ftill held by the patriots. With this latter view, he directed Sir David Baird to take the route towards Valencia de Don Juan, while the reft of the army was to proceed by Caftro Gonzalo. By this divifion the magazines and ftores which had been depofited at Benevente and Zamora, were alfo effectually fecured.

According to the arrangement made, General Frafer, followed by General Hope, marched with their divifions on the 24th December to Valderos and Majorga, and Sir David Baird proceeded with his to Valencia. To conceal this movement, Lord Paget was ordered to pufh on ftrong patrols of cavalry clofe to the advanced pofts of the enemy. The referve, with two light corps, did not retire from Sahagun till the morning of the 25th, following General Hope. Lord Paget was ordered to remain with the cavalry until evening, and then follow the referve. Thefe laft were accompanied by Sir John. The retreat commenced in this deliberate manner. On the 26th of December, Sir David Baird reached the Eflar, and paffed the ferry with lefs difficulty than was expected. He took poft, according to his orders, at Valencia, and wrote to the marquis of Romana, urging him to blow up the bridge of Manfilla. The other divifions of infantry proceeded unmolefted to Caftro Gonzalo. On the 24th the advanced guard of Bonaparte's army marched from Tordefillas, 120 miles from Madrid, and ftrong detachments of cavalry had been pufhed forward to Villalpando and Majorga. On the 26th, Lord Paget fell in with one of thofe detatchments at the latter place. His lordfhip immediately ordered Colonel Leigh, with two fquadrons of the 10th huffars, to attack this corps, which had halted on the fummit of a fteep hill. One of Colonel Leigh's fquadrons was kept in referve; the other rode brifkly up the hill; on approaching the top, where the ground was rugged, the colonel judicioufly reined-in to refrefh the horfes, though expofed to a fevere fire from the enemy. When he had nearly gained the fummit, and the horfes had recovered their breath, he charged boldly and overthrew the enemy; many of whom were killed and wounded, and above 100 furrendered prifoners. Nothing could exceed the coolnefs and gallantry difplayed by the Britifh cavalry on this occafion. The 18th dragoons had fignalized themfelves in feveral former fkirmifhes; they were fuccefsful in fix different attacks. Captain Jones, when at Palencia, had even ventured to charge 100 French dragoons with only 30 Britifh; 14 of the enemy were killed, and fix taken prifoners. The cavalry, the horfe-artillery, and a light corps, remained on the night of the 26th, at Caftro Gonzalo; and the divifions under Generals Hope and Frafer marched to Benevente. On the 27th, the rear guard croffed the Eflar, and followed the fame route, after completely blowing up the bridge.

We fhall not attempt any farther detail of this dangerous and calamitous retreat, in which our army fuffered extremely, from the fatigues of conftant marching, from the badnefs of the weather, and even from the brutality of the Spaniards, in whofe caufe they had embarked. Before they reached Aftorga, it was found neceffary to divide the army. A body of 3000 men, under Brigadier-general Crawford, was detached on the road to Orenfe towards Vigo, while the main body, under the command of Sir John Moore, marched by Aftorga and Lugo, on the road to Corunna. They left Aftorga on the 30th of December, and on the 11th of January came in fight of Corunna. The army had now reached the fea port from which they were to embark, but adverfe winds had detained the tranfports, or the whole of the troops would have been fpeedily and fafely on board. Only a few fhips lay in the harbour, and in thefe fome fick men and a few ftragglers, under pretence of ficknefs, had immediately embarked.

Spain.

An. 1809.

191

Clofely followed by the French.

During the whole march from Sahagun to Corunna, the Britifh army was clofely followed by the French, under Bonaparte and the duke of Dalmatia; and the two armies were often fo near each other, that the French patrols fell in, during the night, with the cavalry piquets of the Britifh. The duke of Dalmatia had joined Bonaparte at Aftorga, and had increafed his force to nearly 70,000 men, while the whole force of the Britifh did not exceed 26,000. When Sir John's army reached Lugo, it was found that three divifions of the French were arranged in front, and it was thought advifable, on the 8th of January, to offer the enemy battle. This offer, however, the French thought proper to decline, and the duke of Dalmatia ftirred not from his poft. When the army reached Corunna, the French were far in the rear, and it was hoped that the tranfports might arrive before the enemy could come up.

The retreat of the Britifh, confidering the circumftances under which it was effected, was a brilliant and fuccefsful achievement. Two hundred and fifty miles of country had been traverfed in 11 days, during the worft feafon of the year, through bad roads, over mountains, defiles, and rivers, and in almoft daily contact with an enemy nearly three times their numbers. Though often engaged, the rear guard of the Britifh had never been beaten, nor even thrown into confufion. Many loffes had indeed been fuftained, in baggage, artillery, and horfes, and many ftragglers had fallen into the hands of the enemy; but neither Napoleon nor the duke of Dalmatia could boaft of a fingle military trophy taken from the retreating army. The greateft danger was ftill to be incurred; the pofition of Corunna was found to be extremely unfavourable; the tranfports had not arrived, and the enemy began to appear upon the heights. The fituation of the army was by moft of the officers thought fo defperate, that they advifed the general to propofe terms to the duke of Dalmatia, that they might be fuffered to embark unmolefted; but this advice Sir John, without hefitation, rejected.

On the 12th of January, the French were feen moving in confiderable force on the oppofite fide of the river Mero. They took up a pofition near the village of Perillo, on the left flank of the Britifh, and occupied the houfes along the river. In the mean time Sir John was inceffantly occupied in preparing for the defence of his poft, and in making every arrangement for the embarkation of the troops. 192

Pofition of the army.

On the 13th, Sir David Baird marched out of Corunna with his divifion, and took poft on a rifing ground, where he determined to remain all night. A divifion under General Hope was fent to occupy a hill on the left, which commanded the road to Betanzos, forming a femicircle with Sir David Baird's divifion on the right. General Frazer's divifion was drawn up near the road to Vigo, about half a mile from Corunna, and communicated

Spain.

communicated with that under Sir David Baird, by means of the rifle corps attached to the latter, which formed a chain acrofs the valley. The referve under Major-general Paget occupied a village on the Betanzos road, about half a mile from the rear of General Hope. The higher grounds on the rear and flanks of the Britifh were poffeffed by the French, a fituation which gave the latter a confiderable advantage.

In the evening the tranfports from Vigo hove in fight; but the enemy was now fo near, and had, during this day, fhown fo much difpofition to moleft the Britifh, that a general action was become inevitable. On the 15th, the enemy had advanced to a height where, the day before, a magazine, containing nearly 4000 barrels of gun powder, had been blown up, and which was immediately oppofite to the pofition of the Britifh. On this day fome fkirmifhes took place.

193 Battle of Corunna.

On the 16th, every thing was prepared for a general action. Moft of the artillery had been embarked, as it was found that, from the nature of the ground, much artillery could not be employed with advantage. During the 13th and 14th, the fick, the difmounted cavalry and horfes, were alfo nearly all embarked. On the morning of the 16th, the French on the hills were apparently quiet, and it was hoped that the embarkation might be effected in the courfe of that night; but about noon the enemy, who had in the morning received reinforcements, and had placed fome guns in front of the right and left of his line, was obferved to be getting under arms, to be moving troops towards his left flank, and forming various columns of attack at that extremity of the ftrong and commanding pofition which he had taken on the 15th, in front of the Britifh line. This indication of his intention was immediately fucceeded by a rapid and determined attack on the divifion under Sir David Baird, which formed the right wing, and was the weakeft part of the line. The firft effort of the enemy was met by Sir John Moore and Sir David Baird at the head of the 42d regiment, and the brigade under Lord William Bentinck. The village on the right became an object of obftinate conteft. While leading on his divifion to fupport this pofition, Sir David had his arm fhattered with a grape fhot.

Not long after, while Sir John Moore was riding from poft to poft, everywhere encouraging his troops, and pointing out the moft advantageous opportunities for attack or defence, his confpicuous fituation had expofed him to the fire of the enemy. A cannon-ball ftruck his left fhoulder, and beat him to the ground. He raifed himfelf, and fat up with an unaltered countenance, looking intently at the Highlanders, who were warmly engaged. Captain Hardinge threw himfelf from his horfe, and took him by the hand; then, obferving his anxiety, he told him the 42d were advancing, upon which his countenance immediately brightened. His friend Colonel Graham now difmounted to affift him; and, from the compofure of his features, entertained hopes that he was not even wounded: but obferving the horrid laceration and effufion of blood, he rode off for furgeons. The general was carried from the field on a blanket, by a fergeant of the 42d, and fome foldiers. On the way he ordered Captain Hardinge to report his wound to General Hope, who affumed the command. Many of the foldiers knew that their two chiefs were carried off: yet they continued to fight with undiminifhed courage; and, by the moft determined bravery, not only repelled every attempt of the enemy to gain ground, but actually forced him to retire, though he had brought up frefh troops in fupport of thofe originally engaged.

The enemy finding himfelf foiled, in every attempt to force the right of the pofition, endeavoured by numbers to turn it. A judicious and well-timed movement, which was made by Major-general Paget, with the referve, which corps had moved out of its cantonments to fupport the right of the army, by a vigorous attack, defeated this intention. The major-general having pushed forward the 95th (rifle corps) and 1ft battalion 52d regiment, drove the enemy before him; and, in his rapid and judicious advance, threatened the left of the enemy's pofition. This circumftance, with the pofition of Lieutenant-general Frafer's divifion (calculated to give ftill farther fecurity to the right of the line) induced the enemy to relax his efforts in that quarter. They were, however, more forcibly directed towards the centre, where they were again fuccefsfully refifted by the brigade under Major-general Manningham, forming the left of Sir David Baird's divifion, and a part of that under Major-general Leith, forming the right of the divifion under General Hope. Upon the left the enemy at firft contented himfelf with an attack upon our picquets, which, however, in general, maintained their ground. Finding, however, his efforts unavailing on the right and centre, he feemed determined to render the attack on the left more ferious, and had fucceeded in obtaining poffeffion of the village through which the great road to Madrid paffes, and which was fituated in front of that part of the line. From this point, however, he was foon expelled with confiderable lofs, by a gallant attack of fome companies of the 2d battalion of the 14th regiment, under Lieutenant-colonel Nicholls. Before five in the evening, the Britifh had not only fuccefsfully repelled every attack made upon the pofition, but had gained ground in almoft all points, and occupied a more forward line than at the commencement of the action, whilft the enemy confined his operations to a cannonade, and the fire of his light troops, with a view to draw off his other corps. At fix the firing ceafed. The different brigades were reaffembled on the ground which they occupied in the morning, and the picquets and advanced pofts refumed their original ftations.

Notwithftanding the decided and marked fuperiority which at this moment the gallantry of the troops had given them over an enemy, who, from his numbers and the commanding advantages of his pofition, no doubt expected an eafy victory, General Hope did not, on reviewing all circumftances, conceive that he fhould be warranted in departing from what he knew was the previous and fixed determination of the late commander of the forces, to withdraw the army on the evening of the 16th, for the purpofe of embarkation, the previous arrangements for which had already been made by his order, and were in fact far advanced at the commencement of the action. The troops quitted their pofition about 10 at night, with a degree of order that did them credit. The artillery that remained unembarked, having been withdrawn, the troops followed in the order prefcribed, and marched to their refpective points of embarkation in the town and neighbourhood of Corunna. The picquets remained at their pofts till five in the

Spain.

the morning of the 17th, when they were alfo withdrawn with fimilar order, and without the movement having been difcovered by the enemy.

By the unremitted exertion of the captains of the royal navy, who had been entrufted with the fervice of embarking the army, and in confequence of the arrangements made by the agents for tranfports, the whole of the forces were embarked with an expedition which has been feldom equalled. The brigades under Major-generals Hill and Beresford were deftined to remain till daylight, in order to watch the movements of the enemy. The brigade under General Beresford, which was alternately to form the rear-guard, occupied the land in front of Corunna, while that under General Hill was ftationed on the promontory in the rear of the town by way of referve.

The enemy pufhed his light troops towards the town, foon after eight o'clock in the morning of the 17th, and fhortly after occupied the heights of St Lucia, which commanded the harbour But notwithftanding this circumftance, and the manifold defects of the place, there being no apprehenfion that the rear-guard could be forced, and the difpofition of the Spaniards appearing to be good, the embarkation of Major-general Hill's brigade was commenced and completed by three in the afternoon. After having fully explained, to the fatisfaction of the Spanifh governor, the nature of the movement, and having made every previous arrangement, General Beresford withdrew his corps from the land in front of the town foon after dark, and was, with all the wounded that had not previoufly been removed, fafely embarked before one o'clock of the morning of the 18th.

In this action the Britifh troops had come off with glory, and there can be no doubt, frcm the repulfe of the French forces, and their fubfequent inactivity, that the honour of the victory belonged to the Britifh. The victory had indeed coft them dear. They had loft one of their beft generals; and probably nearly 1000 men had been killed or wounded during the action. It had been achieved at the termination of a long and haraffing fervice. The fuperior numbers, and advantageous pofition of the enemy, not lefs than the actual fituation of the Britifh army, did not admit of any advantage being reaped from fuccefs. The luftre of the Britifh arms had, however, been maintained under the moft difadvantageous circumftances. The army which had entered Spain amidft the faireft profpects, had no fooner completed its junction, than owing to the multiplied difafters that difperfed the native armies around it, it was left to its own refources. The advance of the Britifh troops from the Douro afforded the beft hope, that the fouth of Spain might be relieved; but this generous effort to fave an unfortunate people, alfo afforded the enemy the opportunity of directing every effort of his numerous troops, and concentrating all his principal refources for the deftruction of the only regular force in the north of Spain. Thefe circumftances had produced the neceffity of rapid and haraffing marches, which had diminifhed the numbers, exhaufted the ftrength, and impaired the equipment of the army. Notwithftanding all thefe difadvantages, and thofe more immediately attached to a defenfive pofition, which the imperious neceffity of covering the harbour of Corunna, for a time, had rendered indifpenfible to affume, the native and undaunted valour of Britifh troops was never more confpicuous.

Spain.

At daybreak on the 18th, the Englifh convoy was under fail, and on the 19th it had entirely left the Spanifh coafts.

194 Second expedition under Sir Arthur Wellefley.

Notwithftanding the ill fuccefs which had thus attended the expedition under Sir John Moore, the fpirit of patriotifm which appeared ftill to actuate the fouthern provinces of Spain, and the hope that the common caufe might there be fupported to greater advantage, induced the Britifh miniftry to fend another military force to the weftern peninfula of Europe, to co-operate with the patriots who ftill continued in arms. Accordingly, a body of about 15,000 forces, under the command of Sir Arthur Wellefley, whofe bravery and good conduct in the battle of Vimiera, had recommended him, in a particular manner, both to the miniftry and the nation, was difpatched towards the coaft of Portugal, where Marfhal Beresford ftill maintained a Britifh force; while General Hill, with about 5000 infantry, and 400 cavalry, failed from Ireland with the fame deftination. General Hill arrived at Lifbon on the 4th of April, and foon after Sir Arthur landed with the main body. On the 7th of April the army moved forward towards the Douro, and croffed that river during the night of the 11th, a little above Oporto. Here they fell in with a French detachment from the army of the duke of Dalmatia, which they routed and put to flight, after a fhort but well-contefted action.

After this action the duke of Dalmatia found it neceffary to retreat. He paffed through the defiles of Salamonde, and thus gained confiderably on the Britifh army, though he was obliged to leave behind him part of his artillery. On the 19th of May he was at Allaritz, and on the 20th he continued his retreat acrofs the Minho, which he paffed at Orenfe, thus leaving Portugal once more in poffeffion of the Britifh forces.

Sir Arthur Wellefley, after having remained for fome time in the Portuguefe territory, to refrefh his men after the fatigues which they had undergone, advanced into Spain, and effected a junction with General Cuefta, who then commanded a confiderable part of the remains of the patriotic army. In the latter end of July, the allied army had advanced to Talavera de la Reyna, in the neighbourhood of which they were encountered by a formidable French force, confifting of a corps commanded by Marfhal Victor, another under General Sebaftiani, the guards of Jofeph Bonaparte, amounting to 8000 men, and the garrifon of Madrid. This large force was commanded by Jofeph Bonaparte in perfon, affifted by Marfhals Jourdan and Victor, and General Sebaftiani.

195 Battle of Talavera.

On the 27th of July, an attack was made by the French army on that of the allies, who had taken up their pofition at Talavera. The attack was vigorous, but was repelled with great fpirit and fuccefs, though not without confiderable lofs on the part of the Britifh.

The defeat of this attempt was followed about noon of the 28th by a general attack of the enemy's whole force, on the whole of that part of the pofition which was occupied by the Britifh army. The general attack began by the march of feveral columns of infantry into the valley, with a view to attack the height occupied

by

by Major-general Hill. These columns were immediately charged by the 1st German light dragoons, and 23d dragoons, under the command of General Anson, and supported by General Fane's brigade of heavy artillery; and although the 23d dragoons suffered considerable loss, the charge had the effect of preventing the execution of that part of the enemy's plan. At the same time an attack was directed upon Brigadier-general Alexander Campbell's position in the centre of the combined armies, and on the right of the British. This attack was most successfully repulsed by Brigadier-general Campbell, supported by the king's regiment of Spanish cavalry, and two battalions of Spanish infantry; and the allies were left in possession of the enemy's cannon.

An attack was also made at the same time on Lieutenant-general Sherbrooke's division, which was on the left and centre of the first line of the British army. This attack was most gallantly repulsed by a charge with bayonets, by the whole division; but the brigade of guards which were on the right, having advanced too far, were exposed on their left flank to the fire of the enemy's battery, and of their retiring columns; and the division was obliged to retire towards the original position, under cover of the second line of General Cotton's brigade of cavalry, which had moved from the centre, and the 1st battalion 48th regiment. This regiment was removed from its original position on the heights, as soon as the advance of the guards was perceived, and formed in the plain; it advanced upon the enemy, and covered the formation of Lieutenant-general Sherbrooke's division. Shortly after the repulse of this general attack, in which apparently all the enemy's troops were employed, he commenced his retreat across the Alberche, which was conducted in the most regular manner, and effected during the night, leaving in the hands of the British 20 pieces of cannon, ammunition, tumbrils, and some prisoners.

Though the French were defeated in this engagement, and, according to Sir Arthur Wellesley's account, must have lost at least 10,000 men, the loss of the British was very great. By the official returns it is stated to exceed 5000, namely, in killed, 34 officers, 28 sergeants, 2 drummers, and 735 rank and file; in wounded 195 officers, 165 sergeants, 16 drummers, and 3537 rank and file; and in missing 9 officers, 15 sergeants, 9 drummers, and 620 rank and file. The action, though brilliant, does not appear to have been attended with much advantage to the allies, as, from the reinforcements which the French army was daily receiving, Sir Arthur Wellesley (now Lord Wellington) was soon compelled to fall back towards the frontiers of Portugal, leaving behind him much of his baggage, and the whole of his sick and wounded. It must be recorded to the honour of the French commander, into whose hands these unfortunate men had fallen, that, in consequence of a representation in their favour by Lord Wellington, he treated them with the utmost humanity, and afforded them every accommodation which the nature of their situation admitted.

Since the battle of Talavera, nothing of importance has transpired respecting the state of affairs in Spain. It appears that the patriots still continue to make a stand against their invaders; but it cannot be expected that their opposition shall be ultimately attended with success. The resources of the French are so numerous and extensive, and the force which he is able to draw towards the Spanish peninsula, has been so much increased in consequence of the peace lately concluded between France and Austria, that the liberties of Spain must, we fear, fall a sacrifice, and that kingdom must contribute to swell the already exorbitant power of the house of Bonaparte.

196 Summary view of Spanish history.

We shall conclude the historical part of this article with a summary recapitulation of the principal revolutions which have taken place in Spain.

From the year 240 B. C. to the year 206 B. C. Spain was in some degree under the dominion of the Carthaginians. From the year 206 B. C. to the commencement of the fifth century of the Christian era, it continued almost entirely in possession of the Romans. The Goths reigned in Spain from the year 411 to 711; the Moors from the year 711 till 716, in part of the Asturias; till 820 in Catalonia; till 750 in Sobrarba; till 923 in Leon; till 1073 in different parts of the two Castiles; till 1118 in Aragon; till 1236 in Cordova and Jaen; till 1248 in Seville; till 1264 in the kingdom of Valencia; till 1265 in that of Murcia; and even so late as 1492 in Granada. During the wars against the Moors, the Goths reigned in the Asturias, Gallicia, and, finally, in the kingdom of Leon till 1038.

The house of Navarre, descended from the French house of Bigorre, which had previously reigned in Castile for 10 years, united with it the crown of Leon till the year 1126. This was succeeded by the family of Bourbon, descended from the royal family of France, which reigned over these countries till 1555. The house of Charlemagne, a French family descended from that prince, ruled over Catalonia from the year 802 till 1132. The French family of Bigorre first reigned in Sobrarba, and afterwards in Aragon, from the year 750 to 1162; at that period the French family of Barcelona succeeded to the government, and united to the crown of Aragon that of Catalonia, and afterwards the kingdom of Valencia, over which it reigned till the year 1430. These parts of Spain then came into the possession of the princes of the French branch of Navarre, which reigned in Castile, and continued in their descendants to 1515; at which time the different states of the Spanish monarchy were united under the government of Joanna the Foolish, who reigned over them till her death, which happened in 1555. The Austrian family then possessed the throne till 1700, since which time it has been occupied by a branch of the house of Bourbon, till the late revolution, by placing the Spanish monarchs in the power of the French, has given rise to a new dynasty of princes in the person of Joseph Bonaparte.

197 Antiquities.

The earliest Spanish antiquities which can be with certainty ascertained, belong to the Roman period; and of these the examples are extremely numerous. They abound in the provinces of Catalonia, Valencia, and those which border on the Pyrenees. We cannot here enumerate, much less describe, all the remains of Roman antiquity mentioned by Swinburne, Townsend, De Laborde, and other travellers in Spain. The most remarkable are, the aqueduct at Segovia, in Old Castille, consisting of 159 arches, extending about 740 yards, and being at least 94 feet high, where it crosses the valley; the amphitheatre of the ancient *Saguntum*, near the

Spain.

the modern Morviedro in Valencia, which was hewn out of the folid rock, and appears to have been capable of containing 10,000 fpectators; a fuperb Roman arch, fupported by Corinthian pillars, and having a very lofty gateway, not far from Tarragona; a monument near the fame place, fuppofed to be the tomb of the father and uncle of Scipio Africanus; and a confiderable amphitheatre on an eminence near Seville. It is fuppofed that the ancient city of Italica, built by Scipio Africanus for the reception of his wounded foldiers, ftood near this fpot; but we are affured by Mr Swinburne, that no traces of it now remain.

Of the Gothic edifices, no certain remains are to be found; but the Moorifh antiquities are numerous and fplendid. Of thefe, the moft remarkable are the palace of the Alhambra in the city of Granada, and the mofque of Cordova. Of the former we have already given an account under ALHAMBRA. The mofque, now the cathedral of Cordova, was begun by Abdoulrahman I. caliph of Cordova, and is computed to contain not fewer than 800 columns. The architecture of its doors, windows, and arches, efpecially thofe of the chapel of the Koran, at leaft equals that of the Alhambra in grandeur of defign, and beauty of execution, and exceeds that palace in variety of decoration. This fuperb edifice has been minutely defcribed by Mr Swinburne, in his travels into Spain, Letter 35. Not far from Cordova ftood the magnificent city of Zehra, built by Abdoulrahman III. and which is faid to have employed 25 years in building, and to have coft more than 2,500,000 l. of our prefent fterling money. In this city was a palace containing 1173 columns, of African, Spanifh, Italian, and Afiatic marbles. This fplendid palace, and the city in which it ftood, were entirely deftroyed during the wars by which Spain was defolated in the middle ages.

198 Population of Spain.

It has been computed, that under the dominion of the Romans, Spain contained a population of nearly 50,000,000 of people; but this calculation is, by De Laborde, diminifhed to 20,000,000.

At the clofe of the 14th century, the population is ftated by moft Spanifh writers as follows.

In the ftates of Caftile	11,000,000
States of Aragon,	7,700,000
Kingdom of Granada,	3,000,000
	21,700,000

On what De Laborde deems better authority, he reduces this number to 16,000,000.

In the reign of Ferdinand and Ifabella, at the end of the 15th century, the total population of Spain has generally been eftimated at 20,000,000, but this too is reduced by Laborde to 14,000,000 or 15,000,000.

The population was reduced

in 1688 to - - -	10,000,000
1700 - - - -	8,000,000
1715 - - - -	6,000,000
In 1768 it had rifen to - -	9,307,800
1788 - - - -	10,143,975

According to the table of the provinces, collected chiefly from De Laborde, it amounted, at the end of the 18th century, to 10,308,505; by the laft cenfus, taken in the years 1797 and 1798, the ftatements of which have not been publifhed, but were lately locked up in the office belonging to the minifter of finance, it appears that the population, at the end of the 18th century, exceeded 12,000,000.

From thefe ftatements we obferve, that the population of Spain had gradually diminifhed from its conqueft by the Romans, to the reign of Philip V. in the beginning of the 18th century; but that during the laft hundred years it has rapidly increafed.

Various caufes have been affigned for the remarkable depopulation that had taken place in the Spanifh dominions. Perhaps the following by Dr Playfair are fufficiently plaufible. "The peftilential fevers and epidemical difeafes, which carried off one-third of the inhabitants in the year 1347, and have produced great mortality during the two laft centuries; almoft inceffant ftruggles for dominion, from 714 till the conqueft of Granada, and union of the two crowns of Caftile and Aragon; the expulfion of about 400,000 Jews by Ferdinand and Ifabella, and of 900,000 Moors, A. D. 1610; the difcovery of South America in 1493, which has gradually drained the country of its inhabitants and its induftry; the calamities of war, during two centuries, from the acceffion of the emperor Charles V.; the form of government, and national prejudices, which difcourage foreigners from fettling in the kingdom, and are inimical to manufactures, commerce, and agriculture; the debauchery that prevails among all ranks; the great number of convents; the celibacy of the clergy; religious oppreffion, and numerous feftivals, which leffen the number of working days, and fo abridge the labour of the people."

Of the number above ftated, the clergy are reckoned at leaft 147,722: viz. of fecular clergy, 60,240; of monks 49,270; of nuns and friars, 22,337, and of fubaltern minifters of the church 15,875. The numbers of the clergy have indeed diminifhed by more than 27,000, during the laft 30 years of the 18th century, as in the year 1768 they amounted to 176,057.

199 Number of towns, villages, &c.

According to a calculation in the year 1776, the cities, towns, villages, and hamlets, amounted to 84459 (D); and public edifices and temples to 30,496.

It appears that there exift in Spain 2,628,557 individuals of both fexes, who do not contribute, or at leaft are not fuppofed to contribute, to the population. From this view, and the progrefs we have already ftated, it will be eafy to difcover, by comparative calculations with the detailed ftatements of population in other countries, the proportionate number of births, deaths, marriages, &c. which annually take place in Spain.

200 Government.

The Spanifh government, which was of a limited nature, during the dynafties of the kings of Caftile and Aragon, afterwards became an abfolute monarchy. At that

(D) In the year 1788, the number of villages was eftimated at 19,219; and that of parifhes at 20,080.

that period the royal prerogative was confined both by the expreſs tenor of the laws and the forms of their adminiſtration. The peculiar privileges of the two ſtates of Caſtile and Aragon continued to exiſt long after their reunion; but the royal authority was conſtantly taking umbrage at their exerciſe. The princes of the Auſtrian family did not openly attack them, but had recourſe to the more effectual method of ſecretly undermining them; and thus they were ſo far diminiſhed, that at the cloſe of the 17th century they amounted to little more than mere forms. The attachment of Aragon to the cauſe of the archduke Charles, induced the firſt ſovereign of the royal family of France to aboliſh them entirely. Philip V. having ſubdued Aragon, ſuppreſſed the ſtates-general, the laſt meeting having been held at Zaragoza in the year 1720, on which occaſion Queen Iſabella of Savoy preſided in the abſence of her huſband, who was at that time in Italy. Since that period no further power is left the *Cortez* of Caſtile and Aragon, but the privilege of nominating deputies to the ſtates-general of the kingdom, whenever they are ſummoned by the monarch.

The whole authority, previous to the late revolution, centred in the king and his miniſters; the national affairs were conducted by the different councils, appointed by the crown, which deliberated and formed their plans in the capital. Some of theſe poſſeſſed both legiſlative and executive power, and exerciſed the double function of adviſing the king and adminiſtering juſtice. The council of Caſtile, in this diſtribution of power, was paramount; its decrees being deciſive in the courts, but its judgements were under the controul of the king. The reſolutions were tranſmitted to the monarch by a certain number of members, under the title of the *Chamber of Caſtile*, whoſe influence was prodigiouſly great. This council was ſo denominated, becauſe the members choſen by the king formerly co-operated with miniſters in expediting the affairs of ſtate in the royal chamber, and for this purpoſe they attended the court wherever it was held.

Beſides the council of Caſtile, there was the royal and ſupreme council of the Indies, inveſted with the ſame powers, and exerciſing ſimilar functions with reſpect to the American colonies, as the council of Caſtile with reſpect to the European territory.

201
Revenues.

It is not eaſy to aſcertain the amount of the revenues under the late government. They aroſe from a tax on imports and exports; from the chief objects of internal conſumption; from the monopolies of the crown; from landed eſtates; from tythes of church and abbey lands; from the ſale of indulgences; and from the trade with the American colonies. Their total amount has been variouſly ſtated. M. Jordan has computed it to exceed 7,000,000l. ſterling; by M. De Laborde, the revenues for the European continent alone, are calculated to exceed 8,000,000l. ſterling.

202
Military ſtrength.

It would be abſurd to attempt any eſtimate of the military ſtrength of Spain in its preſent ſtate of diſorganization and confuſion. During the latter part of the 18th century, the land forces in time of peace ſeldom exceeded 50,000 ill-diſciplined troops; but in time of war, the army was capable of being augmented to a formidable force. In the year 1798 the ſtanding forces of the Spaniſh monarchy amounted to 100,000 effective men.

Till of late the Spaniſh navy was highly reſpectable, both as to ſtrength and diſcipline. In the year 1778 the Spaniſh fleet conſiſted of 148 veſſels of all deſcriptions; and of theſe more than 60 were ſhips of the line. In 1788, the number of ſhips of the line amounted to 68, and that of large frigates to 47. In the preſent long conteſt among the powers of Europe, the navy of Spain has been greatly diminiſhed; and the only fleet of any importance now exiſting is that in the harbour of Cadiz.

203
Orders of knighthood.

There are in Spain ſeveral orders of knighthood, or as they are called, military orders. The principal is that of the *Golden Fleece*, inſtituted in the year 1430, by Duke Philip the Good. The order of St Jago di Compoſtella was inſtituted by Ferdinand II. in the year 1175, and its badge is a red uniform croſs in twelve departments. The order of Calatrava, inſtituted by Sancho III. of Caſtile, has for its badge a red croſs in five departments. The order of Alcantara was inſtituted by Ferdinand II.; and its badge is a lily placed croſsways. The order of Monteſa, inſtituted in the year 1317, by James III. king of Aragon, is compoſed of 19 commanderies.

204
Coins.

The money of Spain is either real or imaginary, the former ſerving for the purpoſe of exchange, the latter for keeping accounts and tranſacting buſineſs. Both theſe are common through the whole kingdom; but ſeveral kinds of both are to be found in the different provinces.

Two kinds of real money, both in gold and ſilver, are diſtinguiſhed in Spain; the old, that is, ſuch as were coined before the year 1772, and thoſe coined ſubſequent to that period. None of the former are uniform, but conſiſt of ſmall pieces of different ſizes unequally cut, and their currency is only by weight. The latter uniformly bear the head of the ſovereign on the obverſe, and on the reverſe ſide the arms of Spain; the ancient gold coins are more intrinſically valuable than the modern. The laſt only will be here deſcribed.

Modern Gold Coins.

Coins.	Value in Sterling money.
Durito Eſcudo chico de oro Veniento de oro	- 4s. 2d. (E)
Eſcudo de oro Doblon ſenzillo	- - 8s. 4d.
Doblon de oro	- - 16s. 8d.
Doblon de quatre Medio doblon de a ocho Media onza de oro	1l. 13s. 4d.
Doblon de ocho Onza de oro	- 3l. 6s. 8d.

Modern

(E) In computing the value of the Spaniſh coins in ſterling money, we have employed M. De Laborde's tables; in which their value is eſtimated in money tournois, computing the livre tournois at 10d. ſterling, and the ſol at ½d. ſterling.

Spain.

Modern Silver Coins.

Coins.	Value in sterling money.
Real Real de vellon Medio real de plata	$2\frac{1}{2}$d.
Real de plata Media pecata	5d.
Pecata Real de a dos	10d.
Escudo Medio duro	2s. 1d.
Duro Pezoduro Real de à ocho	4s. 2d.

205 Weights and measures.

The Spanish weights and measures vary considerably in different parts of the kingdom, as almost every province has both peculiar to itself. The pound generally consists of 16 ounces in that part of the kingdom formerly belonging to the crown of Castile, and of 12 ounces in those annexed to the crown of Aragon; viz. in Aragon, in the kingdom of Valencia, and in Catalonia; but the ounce is not the same. We shall here only particularize the weights of Castile.

In the Castiles they reckon by charges, quintals, arobas, arreldes, pounds, ounces, and drams. The following table gives the proportional value of the Castilian weights.

		lb.	*oz.*
The charge contains	3 quintals	300	0
—— quintal	4 arobas	100	0
—— aroba	25 pounds	25	0
—— arrelde	4 pounds	4	0
—— pound	16 ounces	1	0
—— ounce	16 drams		1
—— dram	30 grains		$\frac{1}{16}$
—— grain			$\frac{1}{480}$

The measures are still more complicated than the weights; and especially the measures of capacity, will require to be considered rather more in detail. We shall, as usual, distinguish them into long measure, superficial or land measure, and measures of capacity.

Long measure.—The standard lineal measure in Spain is the royal foot, consisting of $153\frac{41}{100}$ lines; and bearing to the English foot the proportion of about 153 to 144, or of 17 to 16. This foot, however, is not in general use, almost every province having its own foot, which is generally rather less than the royal foot. Thus, the foot in Castile is 8 lines less, and that of Valencia about $9\frac{1}{2}$ lines less than the standard.

Of royal feet 100 are equivalent to 102 feet 7 inches of Catalonia, to 107 feet of Valencia, to 115 feet 10 inches and 4 lines of Castile.

One hundred feet of Catalonia are equal to 92 feet 2 inches 3 lines of the royal foot, to 97 feet $5\frac{1}{2}$ lines of Valencia, and 104 feet 11 inches 11 lines of Castile.

In Valencia 100 feet are equivalent to 93 feet 4 inches 10 lines of the royal foot, to 98 feet 9 inches of Catalonia; and 107 feet 2 inches 6 lines of Castile.

In Castile, 100 feet are equal to 86 feet 1 inch 5 lines of the royal foot; to 93 feet 4 inches $9\frac{1}{2}$ lines of Valencia; and 92 feet 2 inches 3 lines of Catalonia.

Cloths and stuffs in Catalonia are measured by *canas*, in other parts of the kingdom by *varas*; the cana is divided into 8 *pams*, the vara into four. The proportions which these bear to the royal foot will be seen from the following table:

	Feet.	Inches	Lines.
Pam of Catalonia, - -	0	7	4
Cana of Catalonia, - -	4	10	8
Six pams make the Paris ell.			
Pam of Castile, -	0	7	8
Vara of Castile, - -	2	6	8
Pam of the kingdom of Valencia,	2	9	4
Five pams and a little more than $\frac{1}{5}$th, or one vara one pam and a little more than $\frac{1}{5}$th, make a Paris ell.			
Pam of Aragon, - - -	0	6	$7\frac{3}{8}$
Vara of the Asturias, - -	2	5	9
Vara of Aragon, - - -	2	2	$5\frac{1}{2}$
A little less than 6 pams, or one vara two pams, make a Paris ell.			
Pam of Galicia for linen drapery,	0	9	2
Vara of Galicia for ditto, -	2	6	8

Land Measure.—Land in the provinces belonging to the crown of Castile is measured by *ungadas*, *fanegas*, *estadales*, *brasses*, *varas*, *pas*, and *aranzadas*. Of these the ungada contains 50 fanegas, about $204\frac{5}{10}$ feet; the fanega 400 estadales = about $4\frac{8}{100}$ feet; the estadale two brasses = about ten feet; the brass two varas, or about 5 feet 1 inch 4 lines; the pas about $1\frac{2}{3}$d of a vara, and the aranzada about 73 varas. This last is only used for measuring vineyards.

In Biscay land is measured by *carros*, *plazas*, and *celemines*; and in Valencia by *yugadas*, *cahizadas*, *fanegas*, *brasses*, and *pams*.

Measures of Capacity.—Corn is measured in the provinces belonging to the crown of Castile by *cahizas*, *fanegas*, *celemines*, and *quartillos*; and in Biscay the same measures are used, with the exception of the cahiza. The cahiza contains 12 fanegas, and is = about $1\frac{1}{2}$ lb. French; the fanega contains 12 celemines = 124 lb.; the celemine 4 quartillos = 10lb. $5\frac{1}{3}$ ounces, and the quartillo = 2 lb. $7\frac{1}{4}$ ounces.

In Catalonia grain is measured by *salmas*, *charges*, *quarteras*, *cortons*, and *picotis*. The salma contains 2 charges or 6 quintals = 546lb.; the charge contains 2 quarteras or 3 quintals = 273lb.; and the quartero 12 cortans or $\frac{1}{2}$ quintal = 136lb. 8 oz.: the cortan contains 4 picotis or 13 lb. of 12 oz. = 11 lb. 6 oz.; and the picoti $3\frac{1}{4}$lb. of 12 oz. = 2lb. $13\frac{1}{2}$ oz.

The measures for liquids vary exceedingly, according to the liquid they are intended to contain. Thus, at Madrid, honey is measured by *arobas* and *quartillos*, the quartillo being about $1\frac{1}{2}$lbs. and the aroba containing 32 *quartillos*. Oil is measured in New Castile also by arobas and quartillos, but the quartillo is $=6\frac{1}{4}$ lbs; and the aroba contains 4 quartillos, or 25 lbs. In Seville, oil is measured by the pipe and aroba, the pipe containing 34 arobas; while in Valencia it is measured by charges, arobas, and cantaros, the charge containing 12 arobas, and the cantaro equal 28 lbs. 1 oz.

Wine in New Castile is measured by moyos, an imaginary measure, cantaras, azumbres, quartillos, and sextarios.

Spain.

tarios. The moyo contains 16 cantaras, the cantara 12 azumbres, the azumbre 4 quartillos, each equal to 1 lb. At Cadiz wine is meafured by tonneaux, arobas, azumbres, and quartillos. The tonneau contains 30 arobas, the aroba 8 azumbres, the azumbre 4 quartillos, each of which is equal to 1 lb. 1 oz. At Sevilie the meafures for wine are cantaras, azumbres, and quartillos. The cantara contains 8 azumbres, the aroba the fame, the azumbre 4 quartillos, each of which is equal to 17 ounces. In Valencia thefe meafures are, botas or tonneaux, charges, arobas, or cantaras, and azumbres or cuentas; and in Catalonia, pipes, charges, quintals, arobas, quarteros, and quartos, of which the pipe contains 4 charges, the charge 3 quintals, the quintal 4 arobas, the aroba 22 quarteros, the quartero 4 quartos, and the quarto is equal to nearly 3 ounces of Catalonian meafure.

206 Laws.

The laws of Spain, which for a long time varied greatly in the different ftates of the monarchy, are at prefent reduced to a confiderable degree of uniformity. Navarre and Bifcay have retained their ancient laws and conftitution; but the revolution which took place in Spain at the beginning of the 18th century, enabled Philip V. to introduce into Catalonia and the kingdoms of Aragon and Valencia the laws of Caftile; which, excepting a few alterations, rendered neceffary by local peculiarities, ftill continue in full effect.

The laws of Caftile, which are thus become thofe of almoft all Spain, are contained in the codes known by the titles of the *Fuero juzgo*, *Ley de las fiete partidas*, *Ordenamiento real*, *Fuero real*, and *Recepilacion;* of thefe the laft is a collection of occafional edicts of the kings of Spain, and enjoys the higheft authority.

The Roman law has no validity in Spain, and though it may be ftudied by a few lawyers, as containing firft principles univerfally applicable; yet it is never quoted in the courts, and is exprefsly excepted againft by fome of the old laws of Caftile.

207 Adminiftration of juftice.

The conducting of a law fuit in Spain is fubject to very complicated forms; whence neceffarily refults a flownefs of progrefs. The whole bufinefs is carried on by writers, a peculiar branch of the legal profeffion. In the fuperior tribunals, the management of caufes is in like manner committed to a kind of fubaltern magiftrates, called reporters (*relatores*), who contrive to render their own department a fituation of much greater emolument than that of the judge.

In all the branches of civil, military, ecclefiaftical, and judicial adminiftration, in Spain, is evident a fpirit of mildnefs and paternal indulgence, which often degenerates into great abufe. By multiplying courts for the adminiftration of juftice, and by eftablifhing the long feries of appeals from jurifdiction to jurifdiction, in order that each cafe may be heard and re-heard, and receive an equitable fentence, the ftill more important advantages of prompt decifion are facrificed, and a door is opened for chicane.

It is univerfally acknowledged that the courts of exception are far too numerous; they enfeeble the authority of the eftablifhed judges, and withdraw a number of individuals from the fuperintendance of magiftrates who refide among them, and are readily acceffible, to confign them to the care of diftant and dilatory tribunals.

A confiderable degree of jealoufy and oppofition alfo fubfifts among many of the tribunals; hence they mutually weaken each other's authority, and the clients are configned over from court to court; fo that lawfuits become intolerably protracted, and a family is held in fufpenfe for two or three generations. The confequence of this is, that the rich wear out thofe of inferior fortune.

Even the ordinary and regular forms of civil procefs are flow and complicated. The hufbandman is called from his labour, the merchant from his commercial concerns, the artift from his work, and all from their domeftic affairs. Nearly an equal tardinefs takes place in criminal proceffes, fo that witneffes die, and means of proof are loft, while the guilty often efcape unpunifhed; and thofe who have been formally acquitted, are ftill fubject to a long detention in prifon, whence they are at length difmiffed without indemnity, and irretrievably ruined.

In confequence of the great number of courts, the facility of appeal from one to the other, and the tedioufnefs of law fuits; the multitude of judges, advocates, writers, and other fubordinate officers employed in the adminiftration of juftice is prodigious. The number of perfons employed in the different law eftablifhments has been eftimated at 100,000, which is nearly an hundredth part of the population of the country; and the very laft general enumeration of the inhabitants of Spain makes the number of advocates amount to 5675, and of writers to 9351; befides the judges and their fecretaries, the attorneys and their clerks, and the innumerable hoft of alguazils and inferior officers.

Another ferious inconvenience in the adminiftration of Spanifh law, is the neceffity of repofing entire and blind confidence in a clafs of fubaltern officers of the courts, called writers. This appears to be a branch of the profeffion wholly peculiar to Spain; the writer exercifing at the fame time the functions of fecretary, folicitor, notifier, regiftrar, and being the fole medium of communication between the client and the judge.

It is not cuftomary in Spain to allow either of the parties concerned any copy of the documents requifite for carrying on a fuit, except by the exprefs order of the judge. All the writings on both fides are collected together and bound up into a volume, which remains ftatedly in the poffeffion of the writer, who entrufts it for a certain time to the attorneys of the parties for the inftruction of advocates. The writer, to whofe care the documents of any fuit are committed, alfo regifters the decrees and fentences of the judges on the cafe, and notifies to the parties concerned, each ftep of the procefs, by reading to them the proper inftrument; without, however, allowing them to have a copy of it.

The union of fo many important functions in the fame perfon, neceffarily affords various opportunities for difhonefty; and the chance of being impofed upon is ftill further increafed by an unwife regulation which obliges the defendant, in any action, to choofe the fame writer as is employed by the plaintiff.

It may be remarked that fcarcely any other perfons are under equal temptations to difhonefty on account of the almoft total impunity that they enjoy in confequence of the following regulation. In all thofe diftricts where there are either a corregidor and fuperior alcade, or two fuperior alcades; each of thefe officers has an independent tribunal for the decifion of law fuits; and the right of pronouncing fentence in any particular cafe belongs to him of the two at whofe tribunal the firft application

Spain.

tion was made. Now the eftablifhed falaries of thefe officers are fo fmall, that the largeft part of their emoluments arifes from their fees: this portion of their income depends wholly on the writers, who have the power of inftituting fuits in which of the two courts they pleafe. The natural confequence is, that the judges are induced to overlook and pafs by in filence thofe malpractices of the writers which they cannot prevent without incurring a ferious perfonal lofs. Finally, the authority of the writers is irrefragably eftablifhed by the entire controul that they execute over all caufes. They alone receive the declarations and perfonal anfwers of the parties concerned; they alone receive the depofitions of the witneffes on each fide; put what queftions to them they pleafe; and record the anfwers without the interpofition, and even in the abfence, of the judges.

Another ferious defect in the adminiftration of juftice in Spain, is, that the party condemned, however clearly unjuft may have been his demand, or however weak may have been his defence, is fcarcely ever obliged to pay his adverfary's cofts of fuit; whence it perpetually happens, that the expences of gaining a juft caufe are much greater than the lofs of fubmitting to an unjuft demand; hence alfo it is in the power of a rich villain to oppres and ruin all thofe who are unable to fupport the expences of a law fuit; which in Spain are enormous, and perhaps the more fo, becaufe the eftablifhed charges are very light.

208 Religion.

The religion of Spain is the Roman Catholic; which, in this country and Portugal, has been carried to a pitch of fanaticifm unknown to the Italian ftates, or even in the papal territory. The inquifition, has in thefe unhappy kingdoms, been invefted with exorbitant power, and has produced the moft ruinous effects; having been formerly conducted with a fpirit totally the reverfe of the mildnefs and charity of Chriftianity. This evil has been recently fubdued in a confiderable degree; but one fanatic reign would fuffice to revive it. A yet greater evil, which has fprung from fanaticifm, is the deftruction of morals; for the monks being extremely numerous, and human paffions ever the fame, thofe afcetics atone for the want of marriage by the practice of adultery; and the hufbands, from dread of the inquifition, are conftrained to connive at this enormous abufe. The confcience is feared by the practice of abfolution, and the mind becomes reconciled to the ftrangeft of all phenomena, theoretic piety and practical vice united in bonds almoft indiffoluble.

According to the returns made to the government, the Spanifh clergy then ftood as follows.

Parochial clergy, called curas	16,689
Affiftants, called tenientes curas	5,771
Sacriftans or fextons	10,873
Acolitos to affift at the altar	5,503
Ordinados de patrimonio, having a patrimony of three rials per day	13,244
Ordinados de menores, with inferior ecclefiaftical orders	10,774
Beneficiados, or canons of cathedrals, and other beneficiaries	23,692
Monks	61,617
Carry forward	148,163
Brought over	148,163
Nuns	32,500
Beatas	1,130
Syndics to collect for the mendicants	4,127
Inquifitors	2,705
	188,625

The archbifhoprics were eight in number; and the bifhoprics 46. The moft opulent fee was that of Toledo, fuppofed to yield annually about 90,000l. The Mozarabic Miffal, compofed by St Ifidora for the Gothic church, after the converfion from Arianifm to the Catholic faith, continued to be ufed in Spain till the Moors were fubdued, when the Roman form was introduced.

209 Prefent ftate of the Spanifh clergy.

The Spanifh clergy, in proportion to the population of the country, is lefs numerous than was the clergy of France prior to the revolution; even their wealth is lefs confiderable, but better adminiftered; and their contribution to the public revenue is much greater. As to the general conduct of the Spanifh church, and its influence on the ftate, we may remark that after all the perverted and malicious induftry that has been exerted in the examination of this queftion, the refult has turned out highly favourable to the fuperior orders of the Spanifh clergy, who are, for the moft part, free from thofe irregularities which are charged on the clergy of other countries. The confpicuous fituations in the Spanifh church are by no means confidered as the patrimony of the rich and noble, but as the well-merited reward of irreproachable conduct. Whatever may be the rank of an ecclefiaftic in the facerdotal hierarchy, he never habitually abfents himfelf from his proper place of refidence, where he expends the revenue of his benefice in alms or public works. From the period of the reconqueft of Spain from the Moors, moft of the public eftablifhments owe their foundation to the clergy, by whom alfo whole towns have been rebuilt and raifed from their ruins. The moft beautiful aqueducts, fountains, and public walks in the cities, have been conftructed at the expence of their bifhops; from them alfo the poor have received the moft effectual relief in times of fcarcity, epidemic difeafe, and war. The bifhop of Orenfe converted his epifcopal palace into an almshoufe, where were lodged and fupported 300 French ecclefiaftics, condemned to tranfportation during the furies of the revolution; the prelate himfelf took his place at their table, and refufed to partake of any indulgence that he could not alfo procure for his guefts. Cardinal Orenzana, archbifhop of Toledo, converted the alcazar of that city into an eftablifhment wherein are received 200 children, and 700 poor perfons of all ages. The bifhop of Cordova, during the fcarcity of 1804, and for a long time afterwards, made a daily diftribution of 1200 rations of bread to the poor inhabitants of his diocefe. The aqueduct which conveys water to the city of Tarragona is the work of their archbifhop, who has thus conferred upon the place the inappreciable benefits of cleanlinefs and health; to both of which it was long a ftranger. Similar inftances of public merit may be found in almoft every diocefe.

With regard to the religious orders, their conduct is certainly lefs exemplary, though by no means meriting the reproaches that have been fo liberally caft upon them.

them. The reforms that have taken place at various periods have stopped the progress of the abuses introduced by length of time; and as the numbers of the monks have diminished, their pernicious influence on public opinion has proportionably declined. Some progress has been made in the desirable policy of uniting the different orders of the same rule into a single order; and from the present prohibition to receive novices, it is probable that several orders are about to be totally suppressed.

210 Language and literature.

The Spanish language is one of the great southern dialects which spring from the Roman; but many of the words become difficult to the French or Italian student, beause they are derived from the Arabic used by the Moors. The speech is grave, sonorous, and of exquisite melody, containing much of the flow and formal manner of the orientals.

The Spanish language is, in some respects, very rich; it abounds in compound words, in superlatives, derivatives, augmentatives, diminutives, and frequentative verbs; it has many quite synonymous words, and others which well express the different shades of meaning. In the technical terms of arts and sciences it is, however, extremely poor; a few of these it has borrowed from the Latin, and almost all the rest from the French.

On the whole, the Spanish is one of the finest of the European languages. It is dignified, harmonious, energetic, and expressive; and abounds in grand and sonorous expressions, which unite into measured periods, whose cadence is very agreeable to the ear. It is a language well adapted to poetry; but it also inclines to exaggeration, and its vehemence easily degenerates into bombast. Though naturally grave, it easily admits of pleasantry. In the mouth of well educated men it is noble and expressive; lively and pointed in that of the common people; sweet, seductive, and persuasive, when uttered by a female. Amongst the orators it is touching and imposing, though rather diffuse; at the bar and in the schools it is barbarous, and is spoken about the court in a concise and agreeable manner.

The literature of Spain is highly reputable, though little known to the other countries of Europe since the decline of Spanish power. The Bibliotheca Hispanica of Antonio will completely satisfy the curious reader on this subject. Among the fathers of literature in this country must be named Isidore of Seville, many of whose works are extant, and inferior in merit to few of that epoch. Lives of saints, and chronicles, are also found among the earliest productions; and successive writers may be traced to the 11th century, when they become numerous; but before mentioning some Spanish authorities posterior to that period, it will be proper to recollect that Arabian learning flourished under the caliphs of Cordova, and produced many illustrious names well known to the oriental scholar, as Aben Roe, or Averroes, Aben Zoar, Rhazes, &c. nor must it be forgotten that Aben Nazan wrote a book on the learning and authors of Spain. On this subject the inquisitive are referred to the work of Casiri.

In the 11th century, the Spanish authors began to increase in number, aud the native language begins to appear. This was the epoch of the famous *Cid*, Roderic Didac de Bivar, whose actions against the Moors were celebrated in contemporary songs, and by a long poem written in the following century. After the 13th century, it would be idle to attempt enumerating all the Spanish authors, among whom are Alphonso the Wise, who wrote the Libro del Teroso, a treatise on the Three Parts of Philosophy; and at whose command were compiled the famous Alphonsine Tables of Astronomy. Raymond Lully is said to have written not fewer than 319 books, full of metaphysical froth. In the 15th century appeared Juan de Mena, a poet of surprising powers, since which time a department of literature can scarcely be mentioned in which the Spaniards have not excelled. It would be unnecessary to repeat the well-known names of Cervantes, Quevedo, Lopez de Vega, and others, whose works are known to all Europe. The history of Mexico has been celebrated as a composition; but in fact it is defective and erroneous. The name of Bayer in learning, and of Feyjos in general knowledge, have recently attracted deserved respect; nor has the line of royal authors failed, an elegant translation of Sallust having been published by the heir apparent to the monarchy, the present Ferdinand VII *.

* Pinkerton's Geog. vol. i.

211 Education.

As the rudiments of education are in Spain generally imparted by the monks, it can scarcely be expected that useful knowledge should be common in that country. The accounts given on this subject by travellers, have thrown so little light on the state of education in Spain, that it can be generally understood only by comparison with other Catholic countries. In this comparison Spain will be found inferior to France and Italy, but in many respects superior to Austria and the German states.

212 Universities.

The number of universities in Spain was formerly 24, but only the following 17 now remain, viz. that of Pampeluna, in Navarre; of Oviedo, in the Asturias; of San Jago, in Galicia; of Seville, and of Granada, in the provinces of the same name; of Huesca and Zaragoza, in Aragon; of Avila, Osma, and Valladolid, in Old Castile; of Toledo, Siguenza, and Alcala de Hamarez, in New Castile; of Cervera, in Catalonia; of Orihuela and Valencia, in Valencia; and of Salamanca, in the province of Leon. Of these the most celebrated, are the universities of Zaragoza, Toledo, Alcala, Cervera, and Salamanca.

The university of Zaragoza has 22 professors, and that of Toledo has 24; about 900 students attend the classes of the former, and nearly 3000 those of the latter; yet neither of these establishments is known in Europe, or regarded as of high reputation even in Spain.

The university of Alcala, established at a prodigious expence by Cardinal Ximenes, answered for nearly a century the views of its illustrious founder. This splendid institution consists of 31 general professors, and 13 colleges, each of which has its particular establishment of masters and professors, and of students, who receive gratuitous support and instruction. At present, however, this university is gone so entirely to decay, that scarcely a vestige of its ancient splendour remains, and the whole number of students scarcely amounts to 500.

The university of Cervera, founded at the commencement of the 18th century, with a magnificence truly royal, possesses 43 professors, five colleges, about 900 students; but it partakes of the radical fault of all the Spanish universities; the course of study is incomplete and antiquated, and the very name of the institution is scarcely known beyond the boundaries of Catalonia.

Spain.

The univerfity of Salamanca, the moft ancient of any in Spain, has enjoyed a degree of celebrity which entitles it to a particular defcription.

It was founded by Alphonfo IX. between the years 1230 and 1244, and was confiderably enlarged by Ferdinand III. his grandfon. But its moft magnificent patron was Alphonfo X. furnamed the Wife, fon and fucceffor of the laft mentioned fovereign. This prince richly endowed it, and drew up a fet of ftatutes for its government. He eftablifhed a profefforfhip of civil law, with a falary of 500 maravedies; a profefforfhip of canon law, with a falary of 300 maravedies; two profefforfhips of decretals with falaries of 500 maravedies; two profeffors of natural philofophy, and as many of logic, with falaries of 200 maravedies each; and two mafters of grammar, with falaries of 300 maravedies. It experienced alfo the liberality of many fucceeding fovereigns, and received from the popes a vaft extent of privileges.

For many years this univerfity enjoyed a high reputation; its fame extended over all Europe; it was confulted by kings and by popes, and its deputies were received into the general councils, where they well fuftained the character of the body which they reprefented. Students flocked to it not only from all the provinces of Spain and Portugal, and from the iflands of Majorca and the Canaries, but alfo from the Weft Indies and New Spain, and even from France, Flanders, and England. The number of ftudents who attended the claffes amounted nearly to 15,000. The whole of this vaft eftablifhment confifted of 25 colleges, a library, and an hofpital, called *Del Eftudio*, intended for the amelioration of poor fcholars.

The celebrity of Salamanca continued in full vigour during many ages; but, at length, as rival inftitutions fprang up, declined by flow degrees, fo that by the year 1595, the number of ftudents did not exceed 7000*.

* Dr ... 213

State of the Spanish stage.

After the evacuation of Spain by the Romans, theatrical reprefentations were difcontinued till they were reftored by the Moors, and from them adopted by the Gothic Spaniards, who foon became paffionately fond of the ftage, a tafte which they have ever fince preferved.

They had at firft neither theatres nor a ftage, their dramas were acted in a court, a garden, or the open fields; the actors and fpectators were mingled, and were equally expofed to the injuries of the weather.

At a fubfequent period the ftage was marked out by a kind of boarded platform, and was furrounded by old clothes, drawn back, on occafion, by means of cords, which formed the only decorations, and behind which the actors dreffed. Their properties confifted only of crooks, fome wigs and falfe beards, and a few white fkins, trimmed with gold fringe.

Theatrical exhibitions became more regular and decent towards the end of the 16th century, when a new form was given to them by the exertions of Bartholemew Naharro, a middling dramatic poet. Theatres were then erected, but the greateft part were upon treffels, and two parallel pieces of canvas formed their fcenes, which were fometimes checquered with various colours, fometimes covered with miferable paintings, or adorned with foliage, trees or flowers.

During all thefe periods, the prompter, with a candle in his hand, ftationed himfelf on the ftage by the fide of the performers who were fpeaking, and jumped from fide to fide whenever the actors changed their places. This cuftom prevailed at the end of the 17th century, and even ftill prevails among the ftrolling companies of fmall towns.

Theatres have at length, however, affumed a handfomer appearance in this country, and cuftoms more conformable to the reft of Europe. Handfome theatres have been multiplied, and their ftages are now well arranged and decorated; all the great cities are well provided with them, and many of the fmaller towns may boaft of elegant and not ill furnifhed playhoufes.

The prompter no longer runs from one fide of the ftage to the other; he is placed in the middle before the fcenes, in a kind of well, where he no longer offends the fight and tafte of the fpectator: but an old cuftom which is ftill obferved, greatly injures the intereft and effect of the reprefentation. The prompter, who has the piece before him, does not wait till the actor is at a lofs to prompt him, but recites the whole drama aloud, fo that the actor appears to follow him in his declamation. By this means two voices are heard in the theatre pronouncing the fame words, which are confounded, and often produce a difcord, and the fpectator who has firft heard the piece recited, no longer takes an equal intereft in the fame verfes, phrafes, and words, which the actor afterwards declaims.

The Spanifh theatres are divided into a *patio*, or area, and boxes called *balco* and *apofentos*. The orcheftra, where the muficians are ftationed, adjoins the ftage; an inclofure between it and the pit is fet round with arm chairs, and deftined for the reception of the higher clafs: the *patio*, or pit, is placed behind, and filled with benches, and the *gradas* confift of two rows of benches difpofed amphitheatrically on each fide below the boxes, and fometimes alfo acrofs the lower end of the theatre. This laft divifion is found only in a few theatres; in the others, the fpace beneath the boxes is empty, and perfons ftand in it. The *patio* and the *gradas* contain the common people, the moft numerous, moft noify, and moft imperious part of the public.

There are commonly only two tiers of boxes, fometimes three; they extend on each fide from the ftage to the end of the theatre. The form is the ufual one, but they are divided from each other by partitions, which completely fhut them up on each fide, a circumftance which greatly injures the beauty of the general effect.

There is commonly at the end of the theatre fronting the ftage, a large box with feats placed femicircularly behind one another, which is called the *cazuela*. No man is allowed to enter it, and only women muffled up in their *mantelas* are admitted.

There are feveral things very fingular and amufing in this cazuela. Women of every age and condition are there united; the married are confounded with the fingle; the wives of the common people with thofe of tradefmen and the ladies of the court; the poor woman with the rich one who would not be at the trouble of dreffing to appear in her box. Their appearance is moft curious; they are all covered with their *mantelas*, a kind of white or black veil, and give the idea of a choir of nuns. It is the place for chattering, and between the acts there proceeds from the cazuela a confufed noife like the hum of bees, which aftonifhes and diverts all who hear it for the firft time. Scarcely is the performance ended, when the door of this box, its galleries, paffages, and the ftaircafe leading to it, are

Spain. all besieged by a great crowd of men of every condition; some attracted by curiosity; others coming to wait upon the women who are in it.

Notwithstanding all that has been done for its improvement, the Spanish stage is still far from the celebrity which it once possessed; and the people do not second the efforts of their best writers. The acting is in a still lower state. The performers possess neither that dignity which characterizes great personages, and ennobles a subject without injuring its interest; nor that sweet expression of voice and gesture which goes to the heart, and awakens the sentiments it expresses. In their acting every thing is violent or inanimate; every thing departs from nature. Their recitation is a feat of strength, and is performed at the sole expence of the lungs. Cries and shrieks are its most impressive part, and the most applauded by the majority of the audience. They put nothing in its proper place: all their action is exaggerated; when they threaten they roar; when they command they thunder; when they sigh, it is with an effort which completely exhausts the breath. They substitute anger for dignity, violence for spirit, insipidity for gallantry. Their gestures rarely correspond with the sentiments they ought to express; but resemble their recitation; and are usually monotonous, capricious, ignoble, and almost always violent. The women, in their bursts of passion, become furies; warriors become villains; generals robbers; and heroes bravos. Nothing, as they manage it, is pathetic; nothing makes any impression on the audience. The spectators, equally unmoved at the end of the piece, as at the beginning, see it, without having experienced a single moment of interest or emotion *.

* De Laborde.

214 Produce and agriculture.

As labour and culture are reckoned derogatory to the Spanish character, a sufficient quantity of grain for the support of the inhabitants is not raised, though societies for the encouragement of agriculture have been established in different parts of the kingdom. The principal products are wine, delicious fruits, oil, silk, honey, and wax. A considerable proportion of the mountains and valleys is pastured by immense flocks of sheep, whose wool is extremely fine and valuable. Estremadura is noted for its excellent pastures; and the wool in Old Castile is reputed the finest in the kingdom. In Catalonia the hills are covered with forest and fruit trees. Valencia is celebrated for its silk, and for the exquisite flavour of its melons. Murcia abounds in mulberry trees; and the southern provinces yield the most delicious wines and fruits. Upon the whole, it has been observed of Spain, that few countries owe more to nature, and less to industry.

The soil in general reposes on beds of gypsum, which is an excellent manure. The common course of husbandry about Barcelona begins with wheat; which being ripe in June, is immediately succeeded by Indian corn, hemp, millet, cabbage, kidney beans, or lettuce. The second year these same crops succeed each other as before. The next year they take barley, beans, or vetches; which coming off the ground before midsummer, are followed, as in the former years, by other crops, only changing them according to the season, so as to have on the same spot the greatest possible variety. Near Carthagena the course is wheat, barley, and fallow. For wheat they plough thrice, and sow from the middle of November to the beginning of December; in July they reap from 10 to 100 for one, as the season happens to be humid. The rich vale of Alicant yields a perpetual succession of crops. Barley is sown in September, reaped in April; succeeded by maize, reaped in September; and by a mixed crop of esculents which follow. Wheat is sown in November, and reaped in June; flax in September, pulled in May. In the vale of Valencia wheat yields from 20 to 40; barley from 18 to 24; oats from 20 to 30; maize 100; rice 40. The Spanish plough is generally light; and is drawn by oxen with the yoke over the horns; the most proper and natural mode, as the chief strength of the animal centres in the head. For a very minute account of agriculture in Spain, see De Laborde's View, vol iv. chap. 2.

215 State of the arts.

That prejudice which regards the mechanic arts as base, is not yet extinguished in Spain; hence it happens that these arts are either neglected, or abandoned to such unskilful hands as in general to render the Spaniards much behind their neighbours, in the useful arts of life. The influence of this prejudice is least in the province of Catalonia, where the laws, customs, and opinions are favourable to artizans; and it is accordingly in this province that the mechanic arts have made the greatest progress. Foreign artists experience great difficulties in this country. They are not allowed to practice without gaining admission into some incorporation or company, and this has almost always been refused them.

Some arts have, however, made considerable progress in Spain, especially those of gilding leather, and printing, which has lately acquired a great degree of perfection.

The fabrication of articles of gold and silver might become an important object in a country where these metals abound; but it is neglected, and the demand is almost entirely supplied from foreign markets. What little they perform in this way at home is usually very ill executed, and exorbitantly dear. Madrid, however, begins to possess some good workmen in this way; encouragement would increase their number, and facilitate the means of improvement; but manual labour is there excessively dear. Hence the Spaniards prefer foreign articles of this kind, which, notwithstanding the expence of carriage, the enormous duties which are paid on these articles, and the profits of the merchants, are still cheaper than those made at home.

216 Architecture.

The liberal arts are cultivated in this country with more assiduity and success. The 16th century was the most brilliant period of the arts in Spain, as well as of the sciences, of literature, and of the power and grandeur of the monarchy. A crowd of able architects appeared at once under Charles V. and Philip II. They erected numerous edifices, which will immortalize the reigns of these princes and the names of the artists. John de Herrera and Cepedes displayed the highest talents; Pedro de Uria constructed the magnificent bridge of Almaraz, in Estremadura; John-Baptist-Monegro of Toledo, assisted in the building of the Escurial, and of the church of St Peter at Rome.

The structures of that age are the finest in Spain, and perhaps the only ones in the country which deserve to fix the attention of the skilful spectator. There are some among them which, in regularity, solidity, and magnificence, deserve to be compared with the fine buildings of the Romans. The bridges of Badajoz over the Guadiana, and of Toledo, over the Manzanares, are of this period; as are also the grand house or palace, now the council-

Spain. council-houſe at Madrid, and the beautiful edifices which adorn Toledo; the palace of Los Vargas; the hoſpital of St John the Baptiſt, and that of the Holy Croſs. During the ſame time, the *alcazar* of this city, built under Alphonſo X. was reſtored with the grandeur and magnificence which it ſtill diſplays; and the noble palace was erected, known under the name of the Houſe of Pilate, at Madrid.

That magnificent building the Eſcurial, which the Spaniards called the eighth wonder of the world, which uſed to lodge at once the king and his court, and 200 monks; this famous palace, which aſtoniſhes us by its maſs and extent, by the ſtrength of its ſtructure, the regularity of its proportions, and the ſplendour of its decorations, as much as by the repulſive appearance of its ſite and neighbourhood, alſo belongs to the ſame period, having been erected in the reign of Philip II.

The decline of architecture became as complete in the 17th century as its ſtate had been flouriſhing in the preceding age. From this period no architect occurs worthy of remembrance; and the buildings are monſtrous maſſes, deſtitute of order, taſte, and regularity. One only deſerves notice, the priſon of Madrid, called Carcel de Conte, the work of a happy genius, who knew how to profit by the bright examples of the preceding period.

About the middle of the 18th century, however, architecture began again to be cultivated with ſucceſs. The academy of San-Fernando, at Madrid, has already produced ſeveral able men in this branch, who purſue their art with credit. The handſome bridge built over the Xarama, between Aranjuez and Madrid, in the reign of Charles III. diſplays the talents of Mark de Vierna, his architect; the cuſtom-houſe of Valencia, and the temple-church of the ſame city, conſtructed on the plan of Michael Fernandez; the exchange of Barcelona; the triumphal arch which forms the gate of Alcala, at Madrid, and the ſnuff manufactory at Seville, do honour to the Spaniſh architecture of the preſent day.

217 Painting. Spain juſtly boaſts of many eminent ſculptors; but of all the liberal arts, painting is that which has been moſt cultivated in Spain, and in which its natives have beſt ſucceeded. The Spaniſh ſchool is much leſs known than it deſerves: it holds a middle place between the Italian and Flemiſh ſchools; it is more natural than the former, more noble than the latter, and partakes of the beauties of both. It has particularly excelled in ſacred ſubjects; and we recogniſe in the Spaniſh pictures the feelings uſually experienced by the people of the myſteries of religion. By none have devout ecſtaſy, fervour, and genuine piety, been ſo well expreſſed, or the myſtic paſſion given with ſo much truth. It is not in correctneſs of deſign, or nobleneſs of form, that the Spaniſh artiſts uſually excel, but in the pure imitation of nature, in grace, truth, effect, and the expreſſion of feelings.

The Spaniards have at length opened their eyes to the utility of the arts; they acknowledge them to be advantageous and deſerving of reſpect, and have begun to give them ſuch encouragement as is likely to promote a taſte for them, and to inſure their advancement. Government has done ſomething by affording protection and countenance to the new eſtabliſhments; but the ſtrongeſt impulſe has been given by individuals, or private aſſociations.

Spain now poſſeſſes an academy of painting, at Seville, and two academies of the fine arts, one at Madrid, and the other at Valencia. The firſt owes its origin to an aſſociation of the painters of Seville formed by themſelves, about the year 1660; Charles III. revived it, and eſtabliſhed there a ſchool of the fine arts. That of Madrid was founded by Philip V. The laſt was eſtabliſhed by the exertions of ſome private perſons, aſſiſted by the benefaction of Andrew Majoral, archbiſhop of Valencia, and the protection of the municipal body. Charles III. came to its aſſiſtance 26 years after its eſtabliſhment, with an annual gift of nearly 700l. Theſe academies have for their object the ſtudy and improvement of painting, ſculpture, and architecture; they give public leſſons on theſe three arts, and diſtribute annual prizes among their pupils. That of Madrid, or San-Fernando, ſends its pupils to Rome at the expence of government, to complete their ſtudies.

Public and gratuitous ſchools for drawing have been eſtabliſhed within the laſt 20 years in different places; at Madrid, Cordova, Valencia, Seville, Zaragoza, Barcelona, &c. The laſt of theſe is ſupported by the merchants; that of Vergara was founded by the patriotic ſociety of Biſcay; and thoſe of Zaragoza and Cordova owe their birth to the zeal and generoſity of two individuals; the firſt to Don Martin Noy Cochear, the laſt to Don Antonio Cavallero, the preſent biſhop of Cordova. Thoſe of Madrid, Seville, and Valencia, depend on the academies of theſe cities.

218 Manufactures. The manufactures of Spain were more flouriſhing during the government of the Moors in that country, than they have been at any ſubſequent period. So completely had the kingdom declined in this reſpect at the end of the 16th century, when Philip V. aſcended the throne, that it is ſaid by De Laborde to have been abſolutely deſtitute of trade. The inteſtine wars which ravaged the kingdom during the firſt 14 years of that reign, and the low ſtate to which the national finances were reduced, prevented the government from paying attention to manufactures; and it was not till after tranquillity had been reſtored, and regulations adopted with reſpect to the public revenue, that the natives were induced to wear articles of their own manufacture. Since the reigns of Ferdinand VI. and Charles III. this part of the internal trade of the kingdom has greatly improved, and the manufactures of Spain are now once more on a reſpectable footing.

The Spaniſh manufactures enumerated by De Laborde, in his View of Spain, are thoſe of cloth and other woollen goods; ſilks; brocaded ſtuffs in gold and ſilver; linens and other articles formed from flax or hemp; cottons; leather, and other articles manufactured from ſkins and hides; paper; china and delft ware; brandies; beer; aquafortis; ſalt of lead; ſhears for the woollen trade; copper, iron, and braſs goods; glaſs and mirrors; ſoap; hats; articles for the marine; military implements; arms and ammunition; tobacco and ſnuff. Of theſe, the moſt important are, the woollen and ſilk manufactures; leather; brandy; military weapons; ſoap and tobacco.

The principal places for the woollen manufactures are, Aulot, Arens, Vich, and the convent of Gironne in Catalonia; Jaca, and the diſtrict of Cincavilla in Aragon, and Burgos in Old Caſtile, for woollen ſtockings; Barcelona, Zaragoza, and Burgos, for blankets; Junquera, Segovia, Burgos, and many others for baizes and

Spain

and flannels; Estella in Navarre, Escoray in Biscay, Grazolerna in Seville, Toledo, &c. for coarse cloths, which last article is manufactured in large quantities throughout the kingdom. The woollen stuffs fabricated in Spain are in general of a very inferior quality, the wool being imperfectly scoured, and the dyeing so ill executed that the colours are never permanent.

The chief manufactures for silken articles are those for blonde lace throughout Catalonia, and at Almagro in La Mancha; for silk stockings, at Malaga, Zaragoza, Valencia, Talavera, and Barcelona; and for silk taffeties, serges, damasks, and velvets, at Jaen, Granada, Murcia, Valencia, Malaga, Zaragoza, Toledo, Talavera, and Barcelona. The articles of this manufacture are in general stout and excellent; but they do not possess that brilliancy of appearance so remarkable in the French silks.

Tanning, currying, and dressing hides, skins, and all kinds of leather, are very general throughout Spain; but the skins and hides prepared at Arevaca and Pozuelo, are in greatest repute. The greatest quantity of sole leather is manufactured in the provinces of Aragon and Catalonia; and in the latter province are made and exported a prodigious number of shoes.

The making of brandy is confined chiefly to the states belonging to the crown of Aragon, especially at Torres in Aragon; at Selva, Mataro, &c. in Catalonia; and in Valencia.

Spain.

Spain has long been famous for its manufacture of military weapons; and it is well known that the swords, sabres, hangers, and bayonets, made at Toledo and Barcelona, are of a very superior temper. Large manufactories for fire-arms occur in the district of Guipuscoa, and two royal founderies for brass cannon, are established at Barcelona and Seville.

There is only one manufactory for tobacco and snuff in Spain, viz. at Seville; but this is on a most extensive scale, and is supposed to yield of annual profits about 800,000l. sterling. Here are employed 202 mills, turned by 300 horses or mules; and the various operations call for the daily labour of above 1400 persons. 219

Commerce.

Considering the extent of sea coast belonging to the kingdom of Spain, its commerce is but inconsiderable, and principally takes place between the mother-country and the American colonies. Spain, indeed, carries on a foreign trade with every country in Europe; but its principal transactions are, with England, Holland, Italy, and France. Its exports to these countries consist almost entirely of raw produce, as, if we except oil, wine, brandy, shoes, salt, and a few coarse cloths and silken articles, the trade in manufactured goods is almost wholly confined to the interior of the country. Its chief exports, and the amount yielded by each for the several provinces, as well as the whole amount of the export trade of Spain, to the rest of Europe, will be seen in the following table.

Value of Exports from each Province in pounds sterling.

Goods exported.	*Catalonia.*	*Valencia.*	*Andalusia.*	*Murcia.*	*Aragon.*	*Other Provinces.*	*Total.*

The

Spain. The above table is confined almoft entirely to the European exports. To thefe muft be added the amount of Spanifh exports to the American colonies in order to acquire a juft view of the total amount of the export commerce. The following table will fhow the amount of the exports, both of home and foreign produce, from Spain to America in 1784, as eftimated by Mr Townfend in pounds fterling.

Ports.	Home produce.	Foreign produce.	Total.
Cadiz	1,438,9 2	2,182,531	3.621,443
Malaga	196,379	14,301	210,680
Seville	62,713	30,543	93,256
Barcelona	122,631	21,240	143,871
Corunna	64,575	39 962	104,537
Santander	36,715	90,173	126,888
Canaries	24,974		24,974
Tortofa	7,669	289	7,958
Gijon	4,281	10,190	14471
Total	L.1,958,849	L.2,3[illegible]9 229	L.4.384,878

Of thefe exports we are to regard chiefly thofe of Spanifh produce, and thefe Mr Townfend has probably eftimated too high. M. de Laborde, on whofe authority we are more difpofed to rely, ftates the value of Spanifh domeftic merchandife exported to America in the year 1788, as amounting to 1,635,658l. fterling, while in 1792, it amounted to 2,812,500l; fterling, and on an average of five years, from 1788 to 1792, it amounted to 1,833,333l. fterling. The amount of foreign merchandife exported in 1788, was 1,484,315l. fterling. Adding the average to this laft fum, we have 3,317,648l. fterling for the whole export trade to America. This added to 4,908,304l. fterling, makes a grand total of 8,225,952l. fterling for the whole export trade of Spain.

The Spanifh imports are much more confiderable than the exports. Before the prefent troubles, Spain imported from Holland, tapes, linen drapery, common lace, cutlery goods and paper; from Silefia linen drapery; from Germany, more particularly from Hamburgh, quantities of haberdafhery; from England, calicoes, iron and fteel goods, fine cloth, quantities of cod fifh and ling; the value of the laft articles is eftimated at three millions of duros, five millions livres tournois, (208,333l. 13s. 4d.); from France, calicoes, linen drapery, filk ftockings, filks, camlets, and other kinds of worfted ftuffs, fine cloths, gilded articles, jewellery, iron goods, haberdafhery, fteel goods, and perfumery.

We have not fatisfactory documents fufficient to afcertain the amount of thefe imports, but it was certainly much lefs than that of the imports from the American colonies. Thefe latter, according to Mr Townfend's ftatement, amounted in 1784 to 12,635,173l. fterling; to which, if we add nearly half a million for duty, we fhall have a total of above thirteen millions fterling for American imports alone. De Laborde eftimates the total amount of American imports for the year 1788 at 8,382,330l. fterling, of which Cadiz alone imported 6,6[illegible]7,873l. fterling. If to the above amount we add 577,679l. for the duty at the fame period, we fhall have a total of 8,960,009l. fterling againft the mother country, deducting from this 3,317,648l. for the average exports, we have 5,642,361l. as the balance of trade in favour of the Spanifh colonies. Spain.

220 Inland navigation. Though there are in Spain many navigable rivers, few canals of communication have been conftructed to improve the internal navigation of the country. The canal of Aragon, completed during the reign of Charles IV. muft be highly beneficial to that province. Two canals, viz. that of Tueuftre and the imperial canal, both of which begin at Navarre, run in various windings through Aragon, by turns receding from or approaching the river Ebro, where at length they terminate. Befides the dykes, banks, fluices, and bridges neceffary in the courfe of thefe canals, an aqueduct has been conftructed in the valley of Riozalen, 710 fathoms in length, and 17 feet thick at the bafe, in which the canal runs.

The canal of Caftile, projected and begun in the laft reign, has been almoft abandoned. It was to commence at Segovia, fixteen leagues north of Madrid, to follow the courfe of the Erefma, that falls into the Douro, and to be continued as far north as Reynofa; which is twenty leagues from St Ander, a fea port. At Reynofa is the communication with the canal of Aragon, that unites the Mediterranean to the bay of Bifcay. Above Palencia, a branch goes weftward through Rio-Seco and Benevento to Zamora; making the canal of Caftile, in its whole extent 140 leagues; where it is completed, viz. between Reynofa and Rio-Seco, its width at top is 56 feet, at bottom 20, and nine in depth.

In 1784, a canal was planned, which, from the foot of the mountains of Guadarama near the Efcurial, fhould proceed fouthward to the Tagus; afterwards to the Guadiana, and terminate at the Guadalquivir above Andaxar. Some other attempts to improve the inland navigation of the country have been unfuccefsful.

221 General character of the Spaniards. There is no nation in Europe which difplays fuch a variety of national character as Spain. In no two provinces are the manners and character exactly alike. It is therefore difficult to collect traits on which to found the national character of the Spaniards; and this character has been varioufly reprefented by different writers. From the tranfactions which have lately taken place between that people and the Britifh nation, we confefs ourfelves prejudiced againft them; and we fhall therefore, inftead of fketching their character according to our own preconceived notions, endeavour to delineate it as concifely as poffible from De Laborde, who is probably a fufficiently competent judge.

The national pride, fays this author, is every where the fame. The Spaniard has the higheft opinion of his nation and himfelf, and this he expreffes with energy, in his geftures, words, and actions. This opinion is difcovered among all ranks in life, and all claffes of fociety. Its refult is a kind of haughtinefs, fometimes repulfive to him who is its object, but ufeful in giving to the mind a fentiment of noblenefs and felf-efteem which fortifies it againft all meannefs.

In later times the Spaniards have not degenerated from the valour of their anceftors. The Spanifh foldier is ftill one of the beft in Europe, when placed under an experienced general, and brave and intelligent officers. He poffeffes a cool and fteady valour; he long endures fatigue and hunger, and eafily inures himfelf to labour.

The Spaniards are very referved, and rather wait for, than

than court the advances of a ſtranger. Yet in ſpite of their apparent gravity, they poſſeſs an inward gaiety, which frequently ſhines out when proper occaſions call it forth.

The Spaniard is very ſlow in all his operations; he often deliberates when he ought to act, and ſpoils affairs as much by temporiſing as the natives of other countries do by precipitation. This tardineſs would be but a ſlight defect, did it not proceed from a ſerious radical want, from the invincible indolence and hatred of labour which prevails among all ranks of ſociety.

That jealouſy which was formerly proverbial among the Spaniards, is now greatly diminiſhed; huſbands are much leſs ſuſpicious, and women much more acceſſible. Lattices have diſappeared; duennas exiſt only in romances; veils are exchanged for mantelas; houſes are thrown open, and the women have recovered a liberty by which they are leſs tempted to go aſtray than when their virtue was entruſted to locks and grates, and to the ſuperintendance of guards often faithleſs and eaſily corrupted.

In fine, the Spaniards are ſober, diſcreet, adroit, frank, patient in adverſity, ſlow in deciſion, but wiſe in deliberation; ardent in enterpriſe, and conſtant in purſuit. They are attached to their religion, faithful to their king, hoſpitable, charitable, noble in their dealings, generous, liberal, magnificent; good friends, and full of honour. They are grave in carriage, ſerious in diſcourſe, gentle and agreeable in converſation, and enemies to falſehood and evil ſpeaking.

222 Diverſities of character in the ſeveral provinces.

Such is the Spaniſh character as drawn by De Laborde. Its varieties in the ſeveral provinces are thus ſtated by the ſame author. The Old Caſtilians are ſilent, gloomy, and indolent, and are the moſt ſeverely grave of all the Spaniards; but they poſſeſs a ſteady prudence, an admirable conſtancy under adverſity, an elevation of ſoul, and an unalterable probity and uprightneſs. The character of the natives of New Caſtile is nearly the ſame, but more open, and leſs grave and taciturn. Indocility and conceit make part of the character of the people of Navarre: they are diſtinguiſhed by lightneſs and adroitneſs. The Biſcayans are proud, impetuous, and irritable; abrupt in diſcourſe and in action; haughty and independent, but induſtrious, diligent, faithful, hoſpitable, and ſociable. The Gallicians are gloomy, and live very little in ſociety; but they are bold, courageous, laborious, very ſober, and diſtinguiſhed for their fidelity. The Aſturians partake of the character of the Gallicians and Biſcayans; but they are leſs induſtrious than the former, leſs civilized, leſs ſociable, leſs amiable, and more haughty than the latter. The people of Eſtremadura are proud, haughty, vain, ſerious, indolent; but remarkably ſober, honourable, and much attached to their own province, which they ſeldom quit. The Murcians are lazy, liſtleſs, plotting, and ſuſpicious; attached neither to ſciences, arts, commerce, navigation, nor a military life. The Valencians are light, inconſtant, and indeciſive; gay, fond of pleaſure, little attached to each other, and ſtill leſs to ſtrangers, but affable, agreeable, and diligent. The Catalans are proud, haughty, violent in their paſſions, rude in diſcourſe and in action, turbulent, untractable, and paſſionately fond of independence; they are not particularly liberal, but active, induſtrious, and indefatigable; they are ſailors, huſbandmen, and builders, and reſort to all corners of the world to ſeek their fortunes. They are brave, intrepid, ſometimes raſh, obſtinate in adhering to their ſchemes, and often ſucceſsful in vanquiſhing, by their ſteady perſeverance, obſtacles which would appear inſurmountable to others.

223 Manners and cuſtoms.

The natives of almoſt every province have ſome diſtinguiſhing peculiarity in their dreſs, manners, and purſuits. Before the acceſſion of the houſe of Bourbon to the throne, the uſual dreſs of a Spaniſh nobleman conſiſted of a ſlouched hat, a long black or brown cloak, ſhort jerkin, and ſtrait breeches, with a long Toledo ſword; but French dreſſes are now introduced at court. The higher claſſes wear their hats under their arm. The common people wrap themſelves up to the eyes in a brown cloak, called *aleopo*, that reaches to the ground; and conceal their hair beneath a cotton cap, and a broad hat called a *ſombrero*. When a lady walks abroad, her head and upper part of her body are covered with a mantela; that is, a white or black veil, ſo that it is impoſſible ſhe ſhould be known. At home, the dreſs is a jacket and a petticoat of ſilk or cotton. The hair is generally a fine black; and powder is rare.

In romance, the ladies are celebrated for beauty, and ſome of them deſerve that character; yet beauty is not their general character. They are of a ſlender make, but with great art they ſupply the defects of nature. By an indiſcriminate uſe of paint, they diſfigure their complexion and ſhrivel their ſkin.

Several of the Spaniſh cuſtoms and habits, which ſeem ridiculous to foreigners, are gradually wearing out, and in proceſs of time will no doubt be corrected. The higher claſſes at breakfaſt uſe chocolate, and ſeldom tea. Dinner generally conſiſts of beef, veal, pork, mutton, and beans, boiled together. They are fond of garlic; and it is proverbial that olives, ſalad, and radiſhes, are food for gentlemen. The men drink little wine, and the women uſe water or chocolate. Both ſexes ſleep after dinner, and air themſelves in the cool of the evening. Their repaſts are compoſed of ſweatmeats, biſcuit, coffee and fruit, which ſervants diſtribute to the company; who keep their ſeats, and have little converſation.

Dancing and cards are favourite amuſements. Theatrical exhibitions are generally inſipid or ridiculous bombaſt, low wit, abſurdity, and buffoonery. The combats of the cavalleros and bull fights, are almoſt peculiar to this country. On theſe occaſions young gentlemen were uſed to ſhow their courage to their miſtreſſes; and were honoured and rewarded according to their ſucceſs. But theſe exhibitions were lately conducted with greater economy and parſimony; and mercenary champions ſtudied in the moſt ſecure and graceful manner to deſtroy the devoted animal. See *BULL-Fighting*.

The chief defect in all ranks is an averſion to labour and induſtry. The higher orders beſtow no attention on agriculture and commerce; they reſide for the moſt part at court and in the metropolis, reckoning it beneath their dignity to live in villas on their eſtates among their tenants. In their eſtimation, a labouring man quits the dignity of the Spaniſh character, and renders himſelf an object of contempt. Hence a liſtleſs indolence prevails. Thouſands waſte their time in total want of every incitement to action. Their intellectual powers lie dormant, and their views and exertions are confined within the narrow ſphere of mere exiſtence. The common people have no encouragement to induſtry; and muſt feel little

Spain.

concern for the welfare of a country where a few overgrown families engrofs every thing valuable, and never think of the condition of their vaffals. The indigent Spaniard does not beftir himfelf unlefs impelled by want, becaufe he perceives no advantage to be derived from induftry. A ftranger to intemperance and excefs, his fcanty fare is eafily procured; and under a climate fo propitious, few clothes are required. The hovel which he occupies, together with all its contents, has a mean, filthy, defpicable appearance; and all that relates to him bears the impreffion of wretchednefs and mifery *.

* Playfair's Geography, vol. i. p. 68.

There are certain cuftoms which may be regarded as peculiar to the Spaniards, or which at leaft are fcarcely found in any other European country. The number of fervants retained in the families of the higher ranks is prodigious; and even a tradefman's wife, in narrow circumftances, will frequently have four maid fervants, though fhe cannot, with propriety, employ more than two. The houfes of gentlemen, and efpecially of grandees, fwarm with them; and, not unfrequently, all the principal fervants will have their wives and children lodged with them, and fupported by their mafter. We have heard of one nobleman who was at the daily expence of 120l. merely for the maintenance of his numerous retainers.

The Spaniards are fond of meeting in the evening in parties, which are often very numerous. On thefe occafions, the ladies as they arrive place themfelves in one room, and the gentlemen in another; or elfe the ladies range themfelves in a line along the fide of the room, the lady of the houfe always taking the loweft place next to the door, whilft the men remain ftanding, or feat themfelves on the oppofite fide. They remain feparated in this manner till the card parties are introduced. They play at loo, loto, and other games of a fimilar kind. Thofe who do not play, either look on, or embrace the opportunity of chatting with the perfon moft interefting to them. Others form little circles, where the converfation is ufually very animated. Thefe parties very much refemble the French evening, and the Englifh rout.

A *refrefco* fometimes makes part of thefe entertainments, but only on particular occafions, when the company is more than ufually numerous. But orgeat, lemonade, orangeade, ices of different kinds, fweetmeats, and bifcuits, are diftributed with uncommon profufion; and chocolate ends the *funcion*, as all thefe entertainments are called.

Many precautions are taken in Spain againft the heat. The rooms are watered feveral times a-day, and the windows are fhaded on the outfide with awnings of cloth or ticking, or on the infide by large and full curtains. In fome places, as at Valencia, the glafs is taken out of the windows at the approach of fummer, and the doors of the apartments are all fet open.

The beds in Spain are hard, being made of mattreffes, laid on paillaffes, refting on a wooden bottom. The furniture of the houfes is ufually very fimple, and the floors are covered with matting or printed cloth. The chairs have rufh bottoms, and are ufually of different heights, thofe for the ladies being one-third lower than thofe for the gentlemen.

224 Amufements.

Among the principal amufements of the Spaniards muft be reckoned mufic and dancing. Though the Spaniards have a tafte for mufic, they are by no means proficients in that accomplifhment. Their principal inftrument is the guitar, which is in the hands of every body. Different provinces have alfo their peculiar inftruments. Thus the Gallicians ufe a dull and heavy bagpipe; the Catalonians a large flageolet, and a little drum or tabor; and the Bifcayans a fhort flute, with four holes. Caftanettes are alfo extremely common, and are employed with great dexterity and addrefs in the national dances.

The Spaniards are paffionately fond of dancing, and they have certain dances which are peculiar to Spain. Of thefe the fandango is the moft celebrated, and appears to be the moft ancient. It is a very extraordinary dance, in which the whole body is thrown into a regular and harmonious convulfion, expreffive of the moft lafcivious ideas.

The paffion of the Spaniards for thefe dances is carried to a height which can fcarcely be imagined. No fooner are the guitar and the finging to which they are danced heard in a ball room or theatre, than a murmur of delight arifes on all fides; all faces become animated; the feet, hands, and eyes of all prefent are put in motion: it is impoffible to defcribe the effect produced. Mr Townfend, an Englifh traveller, affirms, that if a perfon were to come fuddenly into a church or a court of juftice playing the *fandango*, or the *colero*, priefts, judges, lawyers, criminals, audience, one and all, grave and gay, young or old, would quit their functions, forget all diftinctions, and all fet themfelves a dancing.

The Spanifh balls are directed by two perfons chofen among the vifitors, who are called *baftoneras*, and with the hat under the arm, and the cane in the hand, perform the office of mafters of the ceremonies. One is for the gentlemen, the other for the ladies. It is their bufinefs to appoint who is to dance, whether minuets or country dances: they are in general very attentive to the obfervance of precedence and etiquette, and have ufually the complaifance to contrive that thofe fhall dance together to whom it is peculiarly agreeable to meet.

A fingular cuftom is obferved at thefe balls, which appears new and ftrange to a foreigner. The lady chofen to dance rifes, croffes the room alone, and places herfelf where fhe is to begin dancing, without waiting for her partner to lead her out; and after the dance is over, her partner makes his bow to her again in the middle of the room without taking any further concern about her, or handing her back to her place. But this cuftom prevails only in the provinces.

The bull-fights noticed above were once not only a favourite but a fafhionable fpectacle in Spain. Every city, and almoft every fmall town, had a place fet apart for thefe darling combats; and hither all ranks and ages reforted with the greateft avidity, and witneffed the prowefs of the combatants, and the torture of the wretched animals, whom they were hired to butcher, with the moft favage expreffions of delight. Thefe fights made a part of every feftival, and, as foon as they were announced, the houfewife left her family, the tradefman forfook his fhop, the artift his work-room, the labourer his field, and joy and expectation were painted on every countenance. To the honour of the nation, thefe cruel fports are at length abolifhed, and Spain has thus fet an example of humanity, which Britain, with all her civilization and refinement, need not blufh to copy.

New-SPAIN.

Spalatro ‖ Spallanzani.

New-SPAIN. See MEXICO.

SPALATRO, or SPALATTO, a rich, populous, and ftrong town of the republic of Venice, capital of Venetian Dalmatia, with a good harbour and an archbifhop's fee. Here are the ruins of the palace of Dioclefian, of which the late Mr Robert Adam publifhed in 1764 a fplendid account, enriched with 71 folio plates. In 1784, Spalatro was nearly depopulated by the plague. It is ftrong by fituation, being built on a peninfula, which is joined to terra firma by a neck of land half a mile over. It is feated on the gulf of Venice, 35 miles fouth-eaft of Sebenico, and 102 north-weft of Ragufa. E. Long. 17. 31. N. Lat. 44. 4.

SPALLANZANI, LAZARUS, a celebrated naturalift, was born at Scandiano, in the duchy of Modena, in January 1729. He began his ftudies in his native country, and went to Reggio de Modena at 15 years of age, to profecute them further. He was inftructed in the *belles lettres* by the Jefuits, who contended with the Dominicans in order to fecure his attachment; but his thirft for knowledge determined him to go to Bologna, where his relative Laura Baffi, a woman highly celebrated for her genius, eloquence, and fkill in natural philofophy and mathematics, was one of the moft diftinguifhed profeffors of the Inftitute and of Italy. Under this enlightened guide, he was taught to prefer the ftudy of nature to that of her commentators, judging of the real value of the commentary by its refemblance to the original. He availed himfelf of the wifdom of that lady's counfels, the happy effects of which he very foon experienced. Spallanzani's tafte for philofophy was not exclufive, for he carefully ftudied his own language, became a proficient in the Latin tongue, and attached himfelf above every other to the Greek and French. By the advice of a father whom he ardently loved, he applied himfelf to jurifprudence; but being urged by Anthony Vallifnieri to renounce his vocation, by procuring the confent of his father, he gave himfelf up to the ftudy of mathematics with more zeal than ever, at the fame time devoting himfelf to the ftudy of languages, both living and dead.

It was not long before he was known all over Italy, and what is feldom the cafe, his own country firft put that value on his talents which they juftly merited. He was chofen profeffor of logic, metaphyfics and Greek, in the univerfity of Reggio, in the year 1745, where he taught during ten years, devoting every moment of his leifure time to the ftudy and contemplation of the works of nature. The attention of Haller and Bonnet was fixed by his obfervations on the animalculæ of infufions, the latter affifting him in his laudable career, and ever after diftinguifhed him as one of the learned interpreters of nature.

Spallanzani was invited to the univerfity of Modena in the year 1760, and fome years after he declined to accept of the offers made to him by the academy of Peterfburg, as well as fimilar ones from Coimbra, Parma, and Cefena, though extremely advantageous. He preferred his native fpot, and therefore continued at Modena till the year 1768, and faw raifed up by his care a generation of men conftituting at that time the glory of Italy, among whom we find Venturi, Belloni, Lucchefini, and Angelo Mazzo.

While Spallanzani remained at Modena, he publifhed his *Saggio di Offervazioni Microfcopiche concernente il Syftema di Needham e Buffon*, in 1765, in which he eftablifhes, by a number of the moft ingenious and folid experiments, the *animality of microfcopic animalculæ*. This work was fent by the author to Bonnet, who drew from it a prediction refpecting the future celebrity of Spallanzani, which he lived to fee accomplifhed. This circumftance gave birth to the moft intimate friendfhip, which lafted to the clofe of life, and conftituted their chief happinefs. During the fame year he publifhed a truly original work, entitled *De Lapidibus ab aqua refilientibus*, in which he proves, in oppofition to the commonly received opinion, by the moft fatisfactory experiments, that what are called *ducks* and *drakes*, are not produced by the elafticity of the water, but by the effect naturally refulting from the change of direction experienced by the ftone in its movement, after it has ftruck the water, and that it has been carried over the hollow of the cup formed by the concuffion.

When the univerfity of Padua was re-eftablifhed upon a larger fcale, the Count de Firmian was directed by the emprefs Maria Therefa, to invite Spallanzani to be profeffor of natural hiftory, to which his great reputation made him competent, although it was folicited by many celebrated characters; and he merited it by his fuccefs, as immenfe crowds of ftudents thronged to his lectures. He had a fine genius, and his knowledge was of vaft extent; his method was fimple, but rigorous in its nature, and what he knew he connected with principles firmly eftablifhed. He acquired the valuable art of interpreting nature by herfelf, which diffufed fuch a light over his lectures, that every thing became perfpicuous, which could be faid to afford any inftruction. His difcourfes were plain and animated, and the elegance and purity of his ftyle charmed every hearer. He prepared his lectures a year before hand, and it was his chief aim to render them ufeful in an eminent degree. His new obfervations made them always new and engaging. Many learned perfons who attended his lectures were not above becoming his fcholars, in order to acquire a more extenfive knowledge of what they knew before, and to learn that which otherwife they might probably never have known. The *Contemplation de la Nature* of Bonnet was his text book, the vacancies of which he ably filled up, fully explained the ideas, and eftablifhed the theories by his own experiments. This work was tranflated by him into the Italian language, and he added much to its value by notes of his own, the firft volume of which he publifhed in 1769, and the fecond the following year.

His connection with Bonnet tended, in a great meafure, to influence his genius, which yielded to the fevere method of inveftigation adopted by the philofopher of Geneva. He was proud of being the pupil of fuch an illuftrious character, upon whofe writings he inceffantly beftowed every leifure moment, and thus became anxious to learn from Nature herfelf the proofs of Bonnet's fentiments refpecting the generation of organized bodies, the pleafing nature of which refearch captivated his attention for a confiderable time.

The firft two volumes of this work entitled *Opufculi di Fifica Animale e Vegetabile*, were publifhed in the year 1776, containing the explanation of part of the microfcopic obfervations which were previoufly given to the world.

If it muft be admitted that the art of accurate obfer-

Spallanzani.

tion is by far the most difficult, it cannot be denied that it is at the same time the most necessary, and requires the most brilliant talents and abilities, which were possessed by Spallanzani in a remarkable degree, as is fully evinced by all his researches and all his admirable writings.

The polite manner in which he conducted his dispute with Needham respecting the phenomena of generation, secured for him a high degree of applause. On this occasion he treated of the influence of cold upon animals, and proved that the torpidity of some during winter, does not depend on the impression the blood may receive from it, since a frog deprived of blood, becomes torpid when reduced to the same cold state by being immersed in ice, and swims as formerly when restored to a proper degree of warmth.

Spallanzani travelled through Switzerland and the Grisons in the year 1779, after which he went to Geneva, spending a month with his friends, by whom his conversation was as much admired as his masterly writings. From this place he returned to Pavia, and in 1780 published two more volumes of his *Dissertazione di Fisica Animale e Vegetabile*, wherein he unfolded the secrets of the interpretation of two very intricate phenomena, concerning the economy of animals and vegetables. He was led to this study from some experiments made by him upon *digestion*, for his lectures; and he repeated the experiments of Reaumur on gallinaceous birds, remarking that the trituration which in this case is favourable to digestion, could not be a very powerful means. He perceived that the gizzard of those birds, by which the stones of fruit are pulverized, did not digest the powder thus formed, it being necessary that it should undergo a new operation in the stomach, previous to its becoming chyle for the production of the blood and other humours.

This subject may be regarded as one of the most difficult in physiology, because the observer is always under the necessity of acting and looking in the midst of darkness; the animal must be managed with care, that the derangement of the operations may be avoided; and when the experiments are completed with great labour, it is requisite that the consequences be well distinguished. Spallanzani in this work is truly enchanting, analysing facts with scrupulosity, in order to ascertain their causes with certainty; comparing Nature with his experiments, in order to form a correct judgement respecting them; laying hold of every thing essential to them in his observations, and measuring their solidity by the increase or diminution of supposed causes.

Mr John Hunter appears to have been greatly hurt by this work, which led him to publish, in the year 1785, *Some Observations upon Digestion*, in which he threw out some bitter sarcasms against the Italian naturalist, who took ample revenge by publishing this work in the Italian language, and addressing to Caldani in 1788, *Una Lettera Apologetica in Risposta alle Osservazione del Signor Giovanni Hunter*. In this he exposed with great moderation, but at the same time with logic which nothing could resist, the mistakes and errors of the British physiologist, leaving the power of a reply altogether hopeless.

The generation of animals and plants is treated of in the second volume of this last-mentioned work, in which he proves the pre-existence of germs to fecundation, by experiments as satisfactory as surprising; shewing also the existence of tadpoles in the females of five different species of frogs, in salamanders, and toads, before their fecundation. He likewise recounts the success of some artificial fecundations upon the tadpoles of those five species, and even upon a quadruped.

In the year 1781, he took the advantage of the academical vacation, for the purpose of making a journey, in order to add to the cabinet of Pavia. He set out for Marseilles in the month of July that year, where he began a new history of the sea, which presented him with many new and curious facts on numerous genera of the natives of the ocean. He went also to Finale, Genoa, Massa, and Carrara, to make observations on the quarries of marble, held by statuaries in such estimation. He then returned to Spezzia, and brought from thence to Pavia a vast number of fishes, which he deposited in the cabinet of that city, wholly collected by himself. With the same view and success he visited the coasts of Istria in 1782, and the Apennine mountains the subsequent year, taking notice of the dreadful hurricanes, and the astonishing vapours by which that year became so noted in meteorology. The emperor Joseph, on examining this cabinet presented Spallanzani with a gold medal. In 1785, he was offered the chair of natural history by the university of Padua, vacant by the death of Anthony Vallisnieri; but in order to prevent his acceptance of it, his salary was doubled by the archduke, and he went to Constantinople with Chevalier Zuliani, who had been appointed ambassador from the Venetian republic. He set out on the 21st of August, and reached the Turkish metropolis on the 11th of October, where he remained during eleven months. His attention was fixed by the physical and moral phenomena of this country, which were new even to Spallanzani. He strayed along the borders of the two seas, and ascended the mountains in the vicinity; he paid a visit to the island of Chalki, discovering to the Turks a copper mine, the existence of which they had never once conjectured. He discovered an iron mine not far from Constantinople, in the island of Principi, of which the Turks were equally ignorant, and prepared to return for Italy on the 16th of August 1786.

A voyage by sea was undoubtedly the safest, but the dangers to which he would be exposed by land were regarded as nothing when contrasted with the idea of being beneficial to science and to man. Having reached Bucharest, Mauroceni the friend of science, received Spallanzani with marks of distinction, presented him with many rarities which the country produced, and gave him horses for travelling, with an escort of 30 troopers, to the utmost confines of his own dominions. Our philosopher passed by Hermanstadt in Transylvania, and reached Vienna on the 7th of December, where he remained during five days, and had two long conferences with the emperor Joseph II. was much esteemed by the nobility of that city, and respectfully visited by many literary characters. When he arrived at Pavia, the students went out of the city gates to meet him, and testified their joy at his return by repeated acclamations. He was almost instantly drawn to the auditory, and compelled to ascend the chair from which he had been accustomed to deliver his fascinating lectures; but their demonstrations of joy and shouts of applause made him request of them to give over, and indulge him with

that

that repose in his own house which was now so absolutely necessary. His students this year exceeded 500.

So extensive was the fame of Spallanzani become by this time, that envy was determined, if possible, to wound his reputation. If his discoveries were too new, solid, and original, to be successfully disputed, that vile passion, or rather *fiend*, began to question his integrity and uprightness respecting the administration of the cabinet of Pavia; but this iniquitous attempt to tarnish his honour, only made it shine forth with redoubled splendour. The juridical examination of the tribunals made his integrity appear even purer than before; and it must be mentioned to his honour, that he had the fortitude to forget this event; his enemies in general confessed their mistake, renounced their unprovoked animosity, and still hoped to regain a friendship of which they had proved themselves so unworthy.

In the voyage of Spallanzani we meet with what may be denominated a new volcanology. We are there instructed how to measure the intensity of volcanic fires, and in his analysis of the lava, almost to touch the particular gas which tears those torrents of stone in fusion from the bowels of the earth, and raises them to the top of Mount Etna. This delightful work is closed by some important enquiries into the nature of Swallows, the mildness of their dispositions, the rapidity of their flight, discussing the celebrated problem respecting their remaining torpid during the winter season, proving that artificial cold, much more intense than what is ever naturally experienced in our climates, does not reduce these birds to the torpid state.

Things apparently impossible were often discovered by Spallanzani. In the year 1795 he made one of this description, which he gave to the world in his *Lettere sopra il sospetto d'un nuovo senso nei Pipistrelli*. In that work we are informed that bats, if deprived of sight, act with the same precision in every instance as those which have their eyes; that they shun in the same manner the most trivial obstacles, and also know where to fix themselves when their flight is terminated. Several philosophers confirmed these astonishing experiments, from which a suspicion arose, that these animals must have a new sense, as it appeared to Spallanzani that the other known senses could not compensate for the want of sight; but he was afterwards inclined to think, in consequence of Professor Jurine's experiments on the organ of hearing in bats, that in this particular instance the sense of hearing might possibly supply the want of sight.

The literary career of this celebrated naturalist was terminated by a letter to Giobert, entitled *Sopra la piante chiuse ne vasi dentro l'aqua e l'aria, esposte a l'immediata lume solare e a l'ombra*. These numerous works, which met with the highest approbation, do not comprehend the whole of his multifarious labours; for the phenomena of respiration had occupied his attention a considerable time; their points of resemblance and dissimilitude in many species of animals; and he had nearly finished his voyage to Constantinople, as well as collected many valuable materials for a history of the sea, when his life and labours were unfortunately terminated.

He was seized with a retention of urine on the 4th of February 1799, and next morning was deprived of the regular use of his faculties, only enjoying a sound mind during very short intervals. Tourdes and Professor Scarpa did every thing to save him, which could be produced by the joint exertions of genius, experience, and friendship, but in vain. He died on the 17th; but we know not what credit is due to the assertion, that he edified those around him during his last moments by his *piety*. Be that as it may, while his works exist to speak for themselves, impartial posterity will regard him as a very extraordinary man. These works have been translated into almost every European language, and he was admitted a member of the academies and learned societies of London, Stockholm, Gottingen, Holland, Lyons, Bologna, Turin, Padua, Mantua, and Geneva, and he received from Frederick the Great the diploma of member of the academy of Berlin.

SPAN, a measure taken from the space between the thumb and the tip of the little finger when both are stretched out. The span is estimated at three hand's-breadths or nine inches.

SPANDRELL, the solid work on each haunch of an arch, to keep it from spreading.

SPANHEIM, EZEKIEL, a learned writer in the 17th century, was born at Geneva in 1629; and in 1642 went to Leyden to study. Here he distinguished himself to great advantage; and his reputation spreading, Charles Louis elector palatine sent for him to be tutor to his only son. This task our author discharged to the entire satisfaction of the elector; by whom he was also employed in divers negotiations at foreign courts. He afterwards entered into the service of the elector of Brandenburg, who in 1680 sent him envoy extraordinary to the court of France, and soon after made him a minister of state. After the peace of Ryswic, he was again sent on an embassy to France where he continued from the year 1697 to 1702. The elector of Brandenburg having during that interval assumed the title of *King of Prussia*, conferred on him the title and dignity of a baron. In 1702 he left France; and went ambassador to England, where he had been several times. Here he died in 1710, aged 81 years. It is surprising, that in discharging the duties of a public minister with so much exactness, and amidst so many different journeys, he could find time enough to write the several books published by him. It may be said of him, that he acquitted himself in his negotiations like a person who had nothing else in his thoughts; and that he wrote like a man who had spent his whole time in his study. The principal of his works are, 1. *De præstantia et usu numismatum antiquorum;* the best edition of which is in two volumes folio. 2. Several letters or dissertations on scarce and curious medals. 3. A preface and notes to the edition of the emperor Julian's works, printed at Leipsic in 1696, folio.

SPANIEL, in *Zoology*. See CANIS, MAMMALIA, *Index*.

SPAR, in *Mineralogy*, a name given chiefly to some of the crystallized combinations of lime, as the carbonate and the fluate; the former being called simply *lime spar*, the latter fluor spar, or Derbyshire spar, from the name of the place where it is found in greatest abundance. See MINERALOGY.

SPARGANIUM, BUR-REED, a genus of plants belonging to the class of monœcia, and to the order of triandria; and in the natural system ranged under the 3d order, *Calamariæ*. See BOTANY *Index*.

SPARLING, or SPIRLING, a ſmall fiſh belonging to the genus *Salmo*. See ICHTHYOLOGY, p. 99.

SPARMANNIA, a genus of plants belonging to the claſs of polyandria, and to the order of monogynia. See BOTANY *Index*.

SPARTA, or LACEDÆMON, the capital of the country of Laconia in Greece, an ancient and moſt renowned ſtate, the inhabitants of which have been in all ages celebrated for the ſingularity of their laws and character.—The hiſtory of Sparta for many ages is entirely fabulous; and the authentic accounts commence only with the celebrated lawgiver Lycurgus, who flouriſhed about 870 B. C. See the article LYCURGUS.

1 The hiſtory of Sparta moſtly fabulous till the time of Lycurgus.

After his death, the firſt important tranſaction which we find mentioned in the Spartan hiſtory is the Meſſenian war, which commenced in the year 752 B. C. and ended in the total reduction of the Meſſenian territory, as related under the article MESSENIA. During this period, according to ſome authors, a great change took place in the government of Sparta. This was the creation of the ephori, which is aſcribed to one of the kings named *Theopompus*. This man perceiving that there was a neceſſity for leaving magiſtrates to execute the laws, when the kings were obliged to be in the field, appointed the magiſtrates above mentioned, who afterwards made ſo great a figure in the ſtate (ſee EPHORI). One great privilege of the ephori was, that they did not riſe up at the preſence of the kings, as all other magiſtrates did: another was, that if the kings offended againſt the laws, the ephori took cognizance of the offence, and inflicted a ſuitable puniſhment. From the firſt election of the ephori, the year was denominated, as at Athens, from the firſt election of the archons.

The conqueſt of Meſſenia gave Sparta the ſuperiority over the reſt of the ſtates, excepting only that of Athens, which for a long time continued to be a very troubleſome rival: but the conteſts between theſe two rival ſtates have been ſo fully related under the article ATTICA, that nothing more is requiſite to be added in this place.—In the time of the Perſian war, Leonidas the Spartan king, diſtinguiſhed himſelf in ſuch a manner, as to become the admiration not only of that but of every ſucceding age. It being reſolved in a general council to defend the ſtraits of Thermopylæ againſt the Perſians, 7000 * foot were put under the command of Leonidas; of whom, however, only 300 were Spartans. Leonidas did not think it practicable to defend the paſs againſt ſuch multitudes as the Perſian king commanded; and therefore privately told his friends, that his deſign was to devote himſelf to death for his country.

2 Leonidas undertakes to defend the ſtraits of Thermopylæ againſt the Perſians.

* See *Anacharſis's Travels*, vol. [illegible] p. 463.

Xerxes advancing near the ſtraits, was ſtrangely ſurpriſed to find that the Greeks were reſolved to diſpute his paſſage; for he had always flattered himſelf, that on his approach they would betake themſelves to flight, and not attempt to oppoſe his innumerable forces. However, Xerxes ſtill entertaining ſome hopes of their flight, waited four days without undertaking any thing, on purpoſe to give them time to retreat. During this time, he uſed his utmoſt endeavours to gain and corrupt Leonidas, promiſing to make him maſter of all Greece if he would come over to his intereſt. His offers being rejected with contempt and indignation, the king ordered him by a herald to deliver up his arms. Leonidas, in a ſtyle and with a ſpirit truly laconical, anſwered, "Come thyſelf, and take them." Xerxes, at this reply, tranſported with rage, commanded the Medes and Ciſſians to march againſt them, take them all alive, and bring them to him in fetters. The Medes, not able to ſtand the ſhock of the Greeks, ſoon betook themſelves to flight: and in their room Hydarnes was ordered to advance with that body which was called *Immortal*, and conſiſted of 10,000 choſen men; but when theſe came to cloſe with the Greeks, they ſucceeded no better than the Medes and Ciſſians, being obliged to retire with great ſlaughter. The next day the Perſians, reflecting on the ſmall number of their enemies, and ſuppoſing ſo many of them to be wounded that they could not poſſibly maintain a ſecond fight, reſolved to make another attempt; but could not by any efforts make the Greeks give way: on the contrary, they were themſelves put to a ſhameful flight. The valour of the Greeks exerted itſelf on this occaſion in a manner ſo extraordinary, that Xerxes is ſaid to have three times leaped from his throne, apprehending the entire deſtruction of his army.

3 The Perſians repulſed with great ſlaughter.

Xerxes having loſt all hopes of forcing his way through troops that were determined to conquer or die, was extremely perplexed and doubtful what meaſures he ſhould take in this poſture of affairs; when one Epialtes, in expectation of a great reward, came to him, and diſcovered a ſecret paſſage to the top of the hill which overlooked and commanded the Spartan forces. The king immediately ordered Hydarnes thither with his ſelect body of 10,000 Perſians; who marching all night, arrived at break of day, and poſſeſſed themſelves of that advantageous poſt. The Phocæans, who defended this paſs, being overpowered by the enemy's numbers, retired with precipitation to the very top of the mountain, prepared to die gallantly. But Hydarnes neglecting to purſue them, marched down the mountain with all poſſible expedition, in order to attack thoſe who defended the ſtraits in the rear. Leonidas being now appriſed that it was impoſſible to bear up againſt the enemy, obliged the reſt of his allies to retire: but he ſtaid himſelf, with the Theſpians, Thebans, and 300 Lacedemonians, all reſolved to die with their leader; who being told by the oracle, that either Sparta ſhould be deſtroyed or the king loſe his life, determined without the leaſt heſitation to ſacrifice himſelf for his country. The Thebans indeed remained againſt their inclination, being detained by Leonidas as hoſtages; for they were ſuſpected to favour the Perſians. The Theſpians, with their leader Demophilus, could not by any means be prevailed upon to abandon Leonidas and the Spartans. The augur Megiſtias, who had foretold the event of this enterpriſe, being preſſed by Leonidas to retire, ſent home his only ſon; but remained himſelf, and died by Leonidas. Thoſe who ſtaid did not feed themſelves with any hopes of conquering or eſcaping, but looked upon Thermopylæ as their graves; and when Leonidas, exhorting them to take ſome nouriſhment, ſaid, that they ſhould

4 They are ſhown a way over the hill to ſurround the Greeks.

Sparta.

ſhould all ſup together with Pluto, with one accord they ſet up a ſhout of joy, as if they had been invited to a banquet.

5 Leonidas killed with all his men.

Xerxes, after pouring out a libation at the riſing of the ſun, began to move with the whole body of his army, as he had been adviſed by Epialtes. Upon their approach, Leonidas advanced to the broadeſt part of the paſſage, and fell upon the enemy with ſuch undaunted courage and reſolution, that the Perſian officers were obliged to ſtand behind the diviſions they commanded, in order to prevent the flight of their men. Great numbers of the enemy falling into the ſea, were drowned; others were trampled under foot by their own men, and a great many killed by the Greeks; who knowing they could not avoid death upon the arrival of thoſe who were advancing to fall upon their rear, exerted their utmoſt efforts. In this action fell the brave Leonidas; which Abrocomes and Hyperanthes, two of the brothers of Xerxes, obſerving, advanced with great reſolution to ſeize his body, and carry it in triumph to Xerxes. But the Lacedemonians, more eager to defend it than their own lives, repulſed the enemy four times, killed both the brothers of Xerxes, with many other commanders of diſtinction, and reſcued the body of their beloved general out of the enemy's hands. But in the mean time, the army that was led by the treacherous Epialtes, advancing to attack their rear, they retired to the narroweſt place of the paſſage, and drawing all together except the Thebans, poſted themſelves on a riſing ground. In this place they made head againſt the Perſians, who poured in upon them on all ſides, till at length, not vanquiſhed, but oppreſſed and overwhelmed by numbers, they all fell, except one who eſcaped to Sparta, where he was treated as a coward and traitor to his country; but afterwards made a glorious reparation in the battle of Platæa, where he diſtinguiſhed himſelf in an extraordinary manner. Some time after, a magnificent monument was erected at Thermopylæ, in honour of thoſe brave defenders of Greece, with two inſcriptions; the one general, and relating to all thoſe who died on this occaſion, importing, that the Greeks of Peloponneſus, to the number only of 4000, made head againſt the Perſian army, conſiſting of 3,000,000. The other related to the Spartans in particular, and was compoſed by the poet Simonides, to this purport: "Go, paſſenger, and acquaint the Spartans that we died here in obedience to their juſt commands." At thoſe tombs a funeral oration was yearly pronounced in honour of the dead heroes, and public games performed with great ſolemnity, wherein none but the Lacedemonians and Theſpians had any ſhare, to ſhow that they alone were concerned in the glorious defence of Thermopylæ.

6 A dreadful earthquake at Sparta.

At the end of the 77th Olympiad, a moſt dreadful earthquake happened at Sparta, in which, according to Diodorus, 20,000 perſons loſt their lives; and Plutarch tells us, that only five houſes were left ſtanding in the whole city. On this occaſion the Helotes or ſlaves, whom the Spartans had all along treated with the utmoſt cruelty, attempted to revenge themſelves, by taking up arms, and marching directly to the ruins of the city, in hopes of cutting off at once thoſe who had eſcaped from the earthquake. But in this they were prevented by the prudence of the Spartan king Archidamus; for he, obſerving that the citizens were more deſirous of preſerving their effects than taking care of their own lives, cauſed an alarm to be ſounded, as if he had known that an enemy was at hand. On this the citizens armed themſelves in haſte with ſuch weapons as they could come at; and having marched a little way from the city, met the Helotes, whom they ſoon compelled to retire. The latter, however, knowing that they had now no mercy to expect from thoſe who had alreaty treated them with ſuch cruelty, reſolved to defend themſelves to the laſt. Having therefore ſeized a ſea-port town in Meſſenia, they from thence made ſuch incurſions into the Spartan territories, that they compelled thoſe imperious maſters to aſk aſſiſtance from the Athenians. This was immediately granted; but when the Spartans ſaw that the ſkill of the Athenians in beſieging towns was much greater than their own, they became jealous, and diſmiſſed their allies, telling them, that they had now no farther occaſion for their ſervices. On this the Athenians left them in diſguſt; and as the Helotes and Meſſenians did not chooſe to come to an engagement with a Spartan army in the field, but took ſhelter in their fortified places, the war was protracted for ten years and upwards. At laſt the Helotes were reduced to their former miſery; and the Meſſenians were obliged to leave Peloponneſus, on pain of being made ſlaves alſo. Theſe poor people were then received by the Athenians, who granted them Naupactus for their reſidence, and afterwards brought them back to a part of their own country, from whence in the courſe of the Peloponneſian war they had driven the Spartans.

7 War with the Helotes.

8 With the Athenians and Perſians.

In the year 431 B. C. the Peloponneſian war commenced; of which a full account has been given under the article ATTICA, N° 116—165. It ended moſt unfortunately for the Athenians; their city being taken and diſmantled, as related in the article above mentioned. Thus were the Spartans raiſed to the higheſt pitch of glory; and, in the reign of Ageſilaus, they ſeemed to be on the point of ſubverting the Perſian empire, as related under the article PERSIA, N° 34. But here their good fortune and their views of empire were ſuddenly checked. Ageſilaus had carried on the war in Aſia with the greateſt ſucceſs; and as he would hearken to no terms of accommodation, a Perſian governor named *Tithrauſtes*, having firſt attempted in vain to bribe the king, diſpatched Timocrates the Rhodian with 50 talents into Greece, in order to try whether he could there meet with any perſons leſs incorruptible than the Spartan monarch. This agent found many who inclined to accept his offers; particularly in Thebes, Corinth, and Argos. By diſtributing the money in a proper manner, he inflamed the inhabitants of theſe three cities againſt the Spartans; and of all others the Thebans came into his terms with the greateſt readineſs. They ſaw that their antagoniſts would not of their own accord break with any of the ſtates of Greece, and did not chooſe to begin the war themſelves, becauſe the chiefs of the Perſian faction were unwilling to be accountable for the event. For this reaſon they perſuaded the Locrians to invade a ſmall diſtrict which lay in diſpute betwixt the Phocians and themſelves. On this the Phocians invaded Locris; the Locrians applied to the Thebans, and the Phocians to the Spartans. The latter were glad of an opportunity of breaking with the Thebans; but met with a much warmer reception than they expected. Their old general Lyſander, who had reduced

9 A general combination againſt Sparta.

Sparta.

reduced Athens, was defeated and killed, with the loss of 1000 men: on which disaster Agesilaus was recalled, and obliged to relinquish all hopes of conquering the Persians. His return changed the fortune of the war so much, that all the states began to grow weary of a contest from which nobody derived any advantage except the king of Persia. In a short time a treaty was concluded, known in history by the name of the *peace of Antalcidas*. The terms of this treaty were highly disadvantageous and dishonourable to the Greeks *; for even the Spartans, though successful in Greece, had lost a great battle at sea with the Persian fleet under Conon the Athenian, which entirely broke their power in Asia.

10 Peace of Antalcidas.

* See *Persia*, n° 37.

By the peace of Antalcidas, the government of Bœotia was taken from the Thebans, which they had for a long time enjoyed; and by this they were so much provoked, that at first they absolutely refused to accede to the treaty; but as Agesilaus made great preparations to invade them, they thought proper at last to comply. However, it was not long before a new war commenced, which threatened the total subversion of the Spartan state. As, by the peace of Antalcidas, the king of Persia had in a manner guaranteed the sovereignty of Greece to Sparta, this republic very soon began to exercise its power to the utmost extent. The Mantineans were the first who felt the weight of their resentment, although they had been their allies and confederates. In order to have a pretence for making war against them, they commanded them to quit their city, and to retire into five old villages which, they said, had served their forefathers, and where they would live in peace themselves, and give no umbrage to their neighbours. This being refused, an army was sent against them to besiege their city. The siege was continued through the summer with very little success on the part of the Spartans; but having during the winter season dammed up the river on which the city stood, the water rose to such a height, as either to overflow or throw down the houses; which compelled the Mantineans to submit to the terms prescribed to them, and to retire into the old villages. The Spartan vengeance fell next on the Phliasians and Olynthians, whom they forced to come into such measures as they thought proper. After this they fell on the Thebans, and, by attempting to seize on the Piræum, drew the Athenians also into the quarrel. But here their career was stopped: the Thebans had been taught the art of war by Chabrias the Athenian; so that even Agesilaus himself took the command of the Spartan army in vain. At sea they were defeated by Timotheus the son of Conon; and by land the battle of Leuctra put an end to the superiority which Sparta had held over Greece for near 500 years. See Leuctra.

11 Hostilities r commenced.

12 The power of Sparta entirely broken.

After this dreadful defeat, the Spartans had occasion to exert all their courage and resolution. The women and nearest relations of those who were killed in battle, instead of spending their time in lamentations, shook each other by the hand, while the relations of those who had escaped from the battle hid themselves among the women; or if they were obliged to go abroad, they appeared in tattered clothes, with their arms folded, and their eyes fixed on the ground. It was a law among the Spartans, that such as fled from battle should be degraded from their honours, should be constrained to appear in garments patched with divers colours, to wear their beards half-shaved, and to suffer any to beat them who pleased, without resistance. At present, however, this law was dispensed with; and Agesilaus by his prudent conduct kept up the spirits of the people, at the same time that by his skill in military affairs he checked the progress of the enemy. Yet, during the lifetime of Epaminondas the Theban general, the war went on greatly to the disadvantage of the Spartans; but he being killed at the battle of Mantinea, all parties became quickly desirous of peace. Agesilaus did not long survive; and with him, we may say, perished the glory of Sparta. Soon after this all the states of Greece fell under the power of Alexander the Great; and the Spartans, as well as the rest, having become corrupt, and lost their martial spirit, became a prey to domestic tyrants, and to foreign invaders. They maintained their ground, however, with great resolution against the celebrated Pyrrhus king of Epirus; whom they repulsed for three days successively, though not without assistance from one of the captains of Antigonus. Soon after this, one of the kings of Sparta named *Agis*, perceiving the universal degeneracy that had taken place, made an attempt to restore the laws and discipline of Lycurgus, by which he supposed the state would be restored to its former glory. But though at first he met with some appearance of success, he was in a short time tried and condemned by the ephori as a traitor to his country. Cleomenes, however, who ascended the throne in 216 B. C. accomplished the reformation which Agis had attempted in vain. He suppressed the ephori; cancelled all debts; divided the lands equally, as they had been in the time of Lycurgus; and put an end to the luxury which prevailed among the citizens. But at last he was overborne by the number of enemies which surrounded him; and being defeated in battle by Antigonus, he fled to Egypt, where he put an end to his own life. With him perished every hope of retrieving the affairs of Sparta: the city for the present fell into the hands of Antigonus; after which a succession of tyrants took place; till at last all disturbances were ended by the Romans, who reduced Macedon and Greece to provinces of their empire, as has been related under these articles.

13 Agis and Cleomenes attempt in vain to restore it.

It remains now only to say something concerning the character, manners, and customs of the Spartans, which, as they were founded on the laws of Lycurgus, may best be learned from a view of these laws.

14 Institution of Lycurgus.

The institutions of Lycurgus were divided into 12 tables. The first comprehended such of the Spartan laws as regarded religion. The statues of all the gods and goddesses were represented in armour, even to Venus herself; the reason of which was, that the people might conceive a military life the most noble and honourable, and not attribute, as other nations did, sloth and luxury to the gods. As to sacrifices, they consisted of things of very small value; for which Lycurgus himself gave this reason, That want might never hinder them from worshipping the gods. They were forbidden to make long or rash prayers to the heavenly powers, and were injoined to ask no more than that they might live honestly and discharge their duty. Graves were permitted to be made within the bounds of the city, contrary to the custom of most of the Greek nations; nay, they buried close by their temples, that all degrees of

15 His laws concerning religion.

of people might be made familiar with death, and not conceive it ſuch a dreadful thing as it was generally eſteemed elſewhere: on the ſame account, the touching dead bodies, or aſſiſting at funerals, made none unclean, but were held to be as innocent and honourable duties as any other. There was nothing thrown into the grave with the dead body; magnificent ſepulchres were forbidden; neither was there ſo much as an inſcription, however plain or modeſt, permitted. Tears, ſighs, outcries, were not allowed in public, becauſe they were thought diſhonourable in Spartans, whom their lawgiver would have to bear all things with equanimity. Mourning was limited to 11 days; on the 12th the mourner ſacrificed to Ceres, and threw aſide his weeds. In favour of ſuch as were ſlain in the wars, however, and of women who devoted themſelves to a religious life, there was an exception allowed as to the rules before mentioned; for ſuch had a ſhort and decent inſcription on their tombs. When a number of Spartans fell in battle, at a diſtance from their country, many of them were buried together under one common tomb; but if they fell on the frontiers of their own ſtate, then their bodies were carefully carried back to Sparta, and interred in their family ſepulchres.

16 Concerning the diviſion of land.

II. Lycurgus divided all the country of Laconia into 30,000 equal ſhares: the city of Sparta he divided into 9000, as ſome ſay; into 6000, as others ſay; and as a third party will have it, into 4500. The intent of the legiſlator was, that property ſhould be equally divided among his citizens, ſo that none might be powerful enough to oppreſs his fellows, or any be in ſuch neceſſity, as to be therefrom in danger of corruption. With the ſame view he forbade the buying or ſelling theſe poſſeſſions. If a ſtranger acquired a right to any of theſe ſhares, he might quietly enjoy it, provided he ſubmitted to the laws of the republic. The city of Sparta was unwalled; Lycurgus truſting it rather to the virtue of its citizens than to the art of maſons. As to the houſes, they were very plain; for their ceilings could only be wrought by the axe, and their gates and doors only by the ſaw; and their utenſils were to be of a like ſtamp, that luxury might have no inſtruments among them.

17 Of the citizens, children, &c.

III. The citizens were to be neither more nor leſs than the number of city lots; and if at any time there happened to be more, they were to be led out in colonies. As to children, their laws were equally harſh and unreaſonable; for a father was directed to carry his new-born infant to a certain place, where the graveſt men of his tribe looked upon the infant; and if they perceived its limbs ſtraight, and thought it had a wholeſome look, they then returned it to its parents to be educated; otherwiſe it was thrown into a deep cavern at the foot of the mountain Taygetus. This law ſeems to have had one very good effect, viz. making women very careful, when they were with child, of either eating, drinking, or exerciſing, to exceſs: it made them alſo excellent nurſes; for which they were in mighty requeſt throughout Greece. Strangers were not allowed to reſide long in the city, that they might not corrupt the Spartans by teaching them new cuſtoms. Citizens were alſo forbidden to travel, for the ſame reaſon, unleſs the good of the ſtate required it. Such as were not bred up in their youth according to the law, were not allowed the liberty of the city, becauſe they held it unreaſonable, that one who had not ſubmitted to the laws in his youth ſhould receive the benefit of them when a man. They never preferred any ſtranger to a public office; but if at any time they had occaſion for a perſon not born a Spartan, they firſt made him a citizen, and then preferred him.

18 Of celibacy and marriage.

IV. Celibacy in men was infamous, and puniſhed in a moſt extraordinary manner; for the old bachelor was conſtrained to walk naked, in the depth of winter, through the market-place: while he did this, he was obliged to ſing a ſong in diſparagement of himſelf; and he had none of the honours paid him which otherwiſe belonged to old age, it being held unreaſonable, that the youth ſhould venerate him who was reſolved to leave none of his progeny behind him, to revere them when they grew old in their turn. The time of marriage was alſo fixed; and if a man did not marry when he was of full age, he was liable to an action; as were ſuch alſo as married above or below themſelves. Such as had three children had great immunities; ſuch as had four were free from all taxes whatſoever. Virgins were married without portions; becauſe neither want ſhould hinder a man, nor riches induce him, to marry contrary to his inclinations. When a marriage was agreed on, the huſband committed a kind of rape upon his bride. Huſbands went for a long time, ſecretly and by ſtealth, to the beds of their wives, that their love might not be quickly and eaſily extinguiſhed. Huſbands were allowed to lend their wives; but the kings were forbidden to take this liberty. Some other laws of the like nature there were, which as they were evidently againſt modeſty, ſo they were far from producing the end for which Lycurgus deſigned them; ſince, though the men of Sparta were generally remarkable for their virtue, the Spartan women were as generally decried for their boldneſs and contempt of decency.

19 Education of their children.

V. It was the care of Lycurgus, that, from their very birth, the Lacedemonians ſhould be inured to conquer their appetites: for this reaſon he directed, that nurſes ſhould accuſtom their children to ſpare meals, and now and then to faſting; that they ſhould carry them, when 12 or 13 years old, to thoſe who ſhould examine their education, and who ſhould carefully obſerve whether they were able to be in the dark alone, and whether they had got over all other follies and weakneſſes incident to children. He directed, that children of all ranks ſhould be brought up in the ſame way; and that none ſhould be more favoured in food than another, that they might not, even in their infancy, perceive any difference between poverty and riches, but conſider each other as equals, and even as brethren, to whom the ſame portions were aſſigned, and who, through the courſe of their lives, were to fare alike: the youths alone were allowed to eat fleſh: older men ate their black broth and pulſe; the lads ſlept together in chambers, and after a manner ſomewhat reſembling that ſtill in uſe in Turkey for the Janizaries: their beds, in the ſummer, were very hard, being compoſed of the reeds plucked by the hand from the banks of the Eurotas: in winter their beds were ſofter, but by no means downy, or fit to indulge immoderate ſleep. They ate altogether in public; and in caſe any abſtained from coming to the tables, they were fined. It was likewiſe ſtrictly forbidden for any to eat or drink at home before they came to the common meal; even then

each

Sparta.

each had his proper portion, that every thing might be done there with gravity and decency. The black broth was the great rarity of the Spartans, which was compofed of falt, vinegar, blood, &c. fo that, in our times, it would be efteemed a very unfavoury foup. If they were moderate in their eating, they were fo in their drinking alfo; thirft was the fole meafure thereof; and never any Lacedemonian thought of drinking for pleafure: as for drunkennefs, it was both infamous and feverely punifhed; and, that young men might perceive the reafon, flaves were compelled to drink to excefs, that the beaftlinefs of the vice might appear. When they retired from the public meal, they were not allowed any torches or lights, becaufe it was expected, that men who were perfectly fober fhould be able to find their way in the dark: and, befides, it gave them a facility of marching without light; a thing wonderfully ufeful to them in time of war.

20 Of their diet, clothing, &c.

VI. As the poor ate as well as the rich, fo the rich could wear nothing better than the poor: they neither changed their fafhion nor the materials of their garments; they were made for warmth and ftrength, not for gallantry and fhow: and to this cuftom even their kings conformed, who wore nothing gaudy in right of their dignity, but were contented that their virtue fhould diftinguifh them rather than their clothes. The youths wore a tunic till they were twelve years old; afterwards they had a cloak given them, which was to ferve them a year: and their clothing was, in general, fo thin, that a Lacedemonian veft became proverbial. Boys were always ufed to go without fhoes; but when they grew up, they were indulged with them, if the manner of life they led required it; but they were always inured to run without them, as alfo to climb up and flip down fteep places with bare feet: nay, the very fhoe they ufed was of a particular form, plain and ftrong. Boys were not permitted to wear their hair; but when they arrived at the age of twenty, they fuffered their hair and beard to grow. Baths and anointing were not much in ufe among the Lacedemonians; the river Eurotas fupplied the former, and exercife the latter. In the field, however, their fumptuary laws did not take place fo ftrictly as in the city; for when they went to war, they wore purple habits; they put on crowns when they were about to engage the enemy; they had alfo rings, but they were of iron; which metal was moft efteemed by this nation. Young women wore their vefts or jerkins only to their knees, or, as fome think, not quite fo low; a cuftom which both Greek and Roman authors cenfure as indecent. Gold, precious ftones, and other coftly ornaments, were permitted only to common women; which permiffion was the ftrongeft prohibition to women of virtue, or who affected to be thought virtuous. Virgins went abroad without veils, with which married women, on the contrary were always covered. In certain public exercifes, in which girls were admitted as well as boys, they were both obliged to perform naked. Plutarch apologifes for this cuftom, urging, that there could be no danger from nakednefs to the morals of youth whofe minds were fortified and habituated to virtue. One of Lycurgus's principal views in his inftitutions, was to eradicate the very feeds of civil diffenfion in his republic. Hence proceeded the equal divifion of eftates injoined by him; hence the contempt of wealth, and the neglect of other diftinctions, as particularly birth, he confidering the people of his whole ftate as one great family; diftinctions which, in other commonwealths, frequently produce tumults and confufions that fhake their very foundation.

21 Obedience to their fuperiors.

VII. Though the Spartans were always free, yet it was with this reftriction, that they were fubfervient to their own laws, which bound them as ftrictly in the city as foldiers, in other ftates, were bound by the rules of war in the camp. In the firft place, ftrict obedience to their fuperiors was the great thing required in Sparta. This they looked upon as the very bafis of government; without which neither laws nor magiftrates availed much. Old age was an indubitable title to honour in Sparta: to the old men the youth rofe up whenever they came into any public place; they gave way to them when they met them in the ftreets, and were filent whenever their elders fpoke. As all children were looked upon as the children of the ftate, fo all the old men had the authority of parents: they reprehended whatever they faw amifs, not only in their own, but in other people's children: and by this method Lycurgus provided, that as youth are everywhere apt to offend, they might be nowhere without a monitor. The laws went ftill further: if an old man was prefent where a young one committed a fault, and did not reprove him, he was punifhed equally with the delinquent. Amongft the youths there was one of their own body, or at moft two years older than the reft, who was ftyled *iren:* he had authority to queftion all their actions, to look ftrictly to their behaviour, and to punifh them if they did amifs; neither were their punifhments light, but, on the contrary, very fevere; whereby the youth were made hardy, and accuftomed to bear ftripes and rough ufage. Silence was a thing highly commended at Sparta, where modefty was held to be a moft becoming virtue in young people; nor was it reftrained only to their words and actions, but to their very looks and geftures; Lycurgus having particularly directed, that they fhould look forward, or on the ground, and that they fhould always keep their hands within their robes. A ftupid inconfiderate perfon, one who would not liften to inftruction, but was carelefs of whatever the world might fay of him, the Lacedemonians treated as a fcandal to human nature; with fuch a one they would not converfe, but threw him off as a rotten-branch and worthlefs member of fociety.

22 Learning.

VIII. The plainnefs of their manners, and their being fo very much addicted to war, made the Lacedemonians lefs fond of the fciences than the reft of the Greeks. A foldier was the only reputable profeffion in Sparta; a mechanic or hufbandman was thought a low fellow. The reafon of this was, that they imagined profeffions which required much labour, fome conftant pofture, being continually in the houfe, or always about a fire, weakened the body and depreffed the mind: whereas a man brought up hardily, was equally fit to attend the fervice of the republic in time of peace, and to fight its battles when engaged in war. Such occupations as were neceffary to be followed for the benefit of the whole, as hufbandry, agriculture, and the like, were left to their flaves the Helotes; but for curious arts, and fuch as ferved only to luxury, they would not fo much as fuffer them to be introduced in their city; in confequence of which, rhetoricians, augurs, Sparta. gurs, bankers, and dealers in money, were ſhut out. The Spartans admitted not any of the theatrical diverſions among them; they would not bear the repreſentation of evil even to produce good; but other kinds of poetry were admitted, provided the magiſtrates had the peruſal of pieces before they were handed to the public.

Above all things, they affected brevity of ſpeech, and accuſtomed their children, from their very infancy, never to expreſs themſelves in more words than were ſtrictly neceſſary; whence a conciſe and ſententious oratory is to this day ſtyled *Laconic*. In writing they uſed the ſame conciſeneſs; of which we have a ſignal inſtance in a letter of Archidamus to the Eleans, when he underſtood that they had ſome thoughts of aſſiſting the Arcadians. It ran thus: "Archidamus to the Eleans: It is good to be quiet." And therefore Epaminondas thought that he had reaſon to glory in having forced the Spartans to abandon their monoſyllables, and to lengthen their diſcourſes.

The greateſt part of their education conſiſted in giving their youth right ideas of men and things: the iren or maſter propoſed queſtions, and either commended the anſwers that were made him, or reproved ſuch as anſwered weakly. In theſe queſtions, all matters, either of a trivial or abſtruſe nature, were equally avoided; and they were confined to ſuch points as were of the higheſt importance in civil life; ſuch as, Who was the beſt man in the city? wherein lay the merit of ſuch an action? and, Whether this or that hero's fame was well-founded? Harmleſs raillery was greatly encouraged; and this, joined to their ſhort manner of ſpeaking, rendered laconic replies univerſally admired.

Muſic was much encouraged; but in this, as in other things, they adhered to that which had been in favour with their anceſtors; nay, they were ſo ſtrict therein, that they would not permit their ſlaves to learn either the tune or the words of their moſt admired odes; or, which is all one, they would not permit them to ſing them if they had learned them. Though the youth of the male ſex were much cheriſhed and beloved, as thoſe that were to build up and continue the future glory of the ſtate, yet in Sparta it was a virtuous and modeſt affection, untinged with that ſenſuality which was ſo ſcandalous at Athens. The good effects of this part of Lycurgus's inſtitutions were ſeen in the union that reigned among his citizens; and which was ſo extraordinary, that even in caſes of competition, it was hardly known that rivals bore ill-will to each other; but, on the contrary, their love to the ſame perſon begat a ſecondary friendſhip among themſelves, and united them in all things which might be for the benefit of the perſon beloved.

Some authors have accuſed this great lawgiver of encouraging theft in his inſtitutions; which, they ſay, was not held ſcandalous among the Spartans, if it were ſo dexterouſly managed as that the perſon was not detected in it. But this is certain, and ſeems to be a ſtrong contradiction of the heinous charge, that when a theft was diſcovered, it was puniſhed with the utmoſt ſeverity: a perſon even ſuſpected of it would endure the heavieſt puniſhments rather than acknowledge it, and be branded with ſo baſe a crime.

23 Exerciſes.

IX. The exerciſes inſtituted by law fall under the ninth table. In theſe all the Greeks were extremely careful, but the Lacedemonians in a degree beyond the reſt; for if a youth, by his corpulence, or any other means, became unfit for theſe exerciſes, he underwent public contempt at leaſt, if not baniſhment.—Hunting was the uſual diverſion of their children; nay, it was made a part of their education, becauſe it had a tendency to ſtrengthen their limbs, and to render thoſe who practiſed it ſupple and fleet: they likewiſe bred up dogs for hunting with great care. They had a kind of public dances, in which they exceedingly delighted, and which were common alike to virgins and young men: indeed, in all their ſports, girls were allowed to divert themſelves with the youths: inſomuch, that, at darting, throwing the quoit, pitching the bar, and ſuch like robuſt diverſions, the women were as dexterous as the men. For the manifeſt oddity of this proceeding, Lycurgus aſſigned no other reaſon, than that he ſought to render women, as well as men, ſtrong and healthy, that the children they brought forth might be ſo too. Violent exerciſes, and a laborious kind of life, were only enjoined the youth; for when they were grown up to men's eſtate, that is, were upwards of 30 years old, they were exempted from all kinds of labour, and employed themſelves wholly either in affairs of ſtate or in war. They had a method of whipping, at a certain time, young men in the temple of Diana, and about her altar; which, however palliated, was certainly unnatural and cruel. It was eſteemed a great honour to ſuſtain theſe flagellations without weeping, groaning, or ſhowing any ſenſe of pain; and the thirſt of glory was ſo ſtrong in theſe young minds, that they very frequently ſuffered death without ſhedding a tear or breathing a ſigh. A deſire of overcoming all the weakneſſes of human nature, and thereby rendering his Spartans not only ſuperior to their neighbours, but to their ſpecies, runs through many of the inſtitutions of Lycurgus; which principle, if well attended to, thoroughly explains them, and without attending to which it is impoſſible to give any account of them at all.

24 Money, &c.

X. Gold and ſilver were, by the conſtitutions of Lycurgus, made of no value in Sparta. He was ſo well apprized of the danger of riches, that he made the very poſſeſſion of them venal; but as there was no living without ſome ſort of money, that is, ſome common meaſure or ſtandard of the worth of things, he directed an iron coinage, whereby the Spartans were ſupplied with the uſeful money, and at the ſame time had no temptation to covetouſneſs afforded them; for a very ſmall ſum was ſufficient to load a couple of horſes, and a great one muſt have been kept in a barn or warehouſe. The introduction of all foreign money was alſo prohibited, that corruption might not enter under the name of commerce. The moſt ancient method of dealing, viz. by barter, or exchange of one commodity for another, was preſerved by law in Sparta long after it had gone into diſuſe everywhere elſe. Intereſt was a thing forbidden in the Spartan commonwealth; where they had alſo a law againſt alienation of lands, accepting preſents from foreigners, even without the limits of their own country, and when their authority and character might well ſeem to excuſe them.

25 Courts of juſtice.

XI. Such of the laws of Sparta as related to courts of juſtice may be brought under the 11th table. Thirty years muſt have paſſed over the head of him who had a right to concern himſelf in juridical proceedings. Young

Young men were thought unfit for them; and it was even held indecent, and of ill report, for a man to have any fondnefs for law-fuits, or to be bufying himfelf at the tribunals, when he had no affairs there of his own. By thefe rules Lycurgus thought to fhut out litigioufnefs, and to prevent that multiplicity of fuits which is always fcandalous in a ftate. As young people were not permitted to inquire about the laws of other countries, and as they were hindered from hearing judicial proceedings in their courts, fo they were likewife forbidden to afk any queftions about, or to endeavour to difcover, the reafons of the laws by which themfelves were governed. Obedience was their duty; and to that alone they would have them kept. Men of abandoned characters, or who were notorioufly of ill fame, loft all right of giving their votes in refpect of public affairs, or of fpeaking in public affemblies; for they would not believe that an ill man in private life could mean his country better than he did his neighbour.

26 Military fervice.

XII. Till a man was 30 years old, he was not capable of ferving in the army, as the beft authors agree; though fome think that the military age is not well afcertained by ancient writers. They were forbidden to march at any time before the full-moon; the reafon of which law is very hard to be difcovered, if indeed it had any reafon at all, or was not rather founded on fome fuperftitious opinion, that this was a more lucky conjuncture than any other. They were likewife forbidden to fight often againft the fame enemy; which was one of the wifeft maxims in the political fyftem of Lycurgus: and Agefilaus, by offending againft it, deftroyed the power of his country, and loft her that authority which for many ages fhe maintained over the reft of Greece; for, by continually warring againft the Thebans, to whom he had an inveterate hatred, he at laft beat them into the knowledge of the art of war, and enabled them, under the command of Epaminondas, to maintain for a time the principality of Greece. Maritime affairs they were forbidden to meddle with, though the neceffity of things compelled them, in procefs of time, to tranfgrefs this inftitution, and by degrees to transfer to themfelves the dominion of the fea as well as of the land: but, after the Peloponnefian war, they again neglected naval affairs from a perfuafion that failors and ftrangers corrupted thofe with whom they converfed. As they never fortified Sparta, they were not ready to undertake fieges: fighting in the field was their proper province, and, while they could overcome their enemies there, they rightly conceived that nothing could hurt them at home. In time of war they relaxed fomewhat of their ftrict manner of living, in which they were fingular. The true reafon for this was, in all probability, that war might be lefs burdenfome to them; for, as we have more than once obferved, a ftrong defire to render them bold and warlike was the reigning paffion of their legiflator. They were forbidden to remain long encamped in the fame place, as well to hinder their being furprifed, as that they might be more troublefome to their enemies, by wafting every corner of their country. They flept all night in their armour; but their outguards were not allowed their fhields, that, being unprovided of defence, they might not dare to fleep. In all expeditions they were careful in the performance of religious rites; and, after their evening meal was over, the foldiers fung together hymns to their gods. When they were about to engage, the king facrificed to the mufes, that, by their affiftance, they might be enabled to perform deeds worthy of being recorded to lateft times. Then the army advanced in order to the found of flutes, which played the hymn of Caftor. The king himfelf fung the pæan, which was the fignal to charge. This was done with all the folemnity imaginable; and the foldiers were fure either to conquer or die: indeed they had no other choice; for if they fled they were infamous, and in danger of being flain, even by their own mothers, for difgracing their families. In this confifted all the excellency of the Spartan women, who, if poffible, exceeded in bravery the men, never lamenting over hufbands or fons, if they died honourably in the field; but deploring the fhame brought on their houfe, if either the one or the other efcaped by flight. The throwing away a fhield alfo induced infamy; and, with refpect to this, mothers, when they embraced their departing fons, were wont to caution them, that they fhould either return armed as they were, or be brought back fo when they were dead; for, as we have obferved, fuch as were flain in battle were neverthelefs buried in their own country. When they made their enemies fly, they purfued no longer than till victory was certain; becaufe they would feem to fight rather for the honour of conquering, than of putting their enemies to death. According to their excellent rules of war, they were bound not to fpoil the dead bodies of their enemies; but in procefs of time, this, and indeed many other of their moft excellent regulations, fell into defuetude. He who overcame by ftratagem, offered up an ox to Mars; whereas he who conquered by force, offered up only a cock; the former being efteemed more manly than the latter. After 40 years fervice, a man was, by law, no longer required to go into the field; and confequently, if the military age was 30, the Spartans were not held invalids till they were 70.

SPARTIANUS, Ælius, a Latin hiftorian, who wrote the lives of Adrian, Caracalla, and four other Roman emperors. He lived under the reign of Dioclefian, about the year 290.

SPARTIUM, Broom, a genus of plants belonging to the clafs of diadelphia, and order of decandria; and in the natural fyftem arranged under the 32d order, *Papilionaceæ*. See Botany *Index*.

The flower buds are in fome countries pickled, and eaten as capers; and the feeds have been ufed as a bad fubftitute for coffee. The branches are ufed for making befoms, and tanning leather. They are alfo ufed inftead of thatch to cover houfes. The old wood furnifhes the cabinet-maker with beautiful materials for vaneering. The tender branches are in fome places mixed with hops for brewing, and the macerated bark may be manufactured into cloth.

The *junceum*, or Spanifh broom, grows naturally in the fouthern provinces of France, as well as in other parts of the fouth of Europe. It grows in the pooreft foils, on the fteepeft declivities of the hills, in a ftony foil, where hardly any other plant could vegetate. In a few years it makes a vigorous fhrub; infinuating its roots between the interftices of the ftones, it binds the foil, and retains the fmall portion of vegetable earth fcattered over thefe hills, which the autumnal rains would other- *Journal de Phyfique.*

wife

wife wash away. It is most easily raised from seed, which is usually sown in January, after the ground has received a slight dressing.

The shrub serves two useful purposes. Its branches yield a thread of which linen is made, and in winter support sheep and goats.

In manufacturing thread from broom, the youngest plants are cut in the month of August, or after harvest, and gathered together in bundles, which at first are laid in the sun to dry: they are then beaten with a piece of wood, washed in a river or pond, and left to steep in the water for about four hours. The bundles thus prepared are taken to a little distance from the water, and laid in a hollow place made for them, where they are covered with fern or straw, and remain thus to steep for eight or nine days; during which time, all that is necessary, is to throw a little water once a-day on the heap, without uncovering the broom. After this, the bundles are well washed, the green rind of the plant or epidermis comes off, and the fibrous part remains; each bundle is then beaten with a wooden hammer upon a stone, to detach all the threads, which are at the same time carefully drawn to the extremity of the branches. After this operation, the faggots are untied, and spread upon stones or rocks till they are dry. The twigs must not be peeled till they are perfectly dry; they are then dressed with the comb, and the threads are separated according to the fineness, and spun upon a wheel.

The linen made of this thread serves various purposes in rural economy. The coarsest is employed in making sacks and other strong cloths for carrying grain or seeds. Of the finest is made bed, table, and body linen. The peasants in several places use no other, for they are unacquainted with the culture of hemp or flax, their soil being too dry and too barren for raising them. The cloth made with the thread of the broom is very useful; it is as soft as that made of hemp; and it would perhaps look as well as that made of flax if it was more carefully spun. It becomes white in proportion as it is steeped. The price of the finest thread, when it is sold, which seldom happens, is generally about a shilling a pound.

The other use to which this broom is applied, is to maintain sheep and goats during winter. In the mountains of Lower Languedoc these animals have no other food from November to April, except the leaves of trees preserved. The branches of this broom therefore are a resource the more precious, that it is the only fresh nourishment which at that season the flocks can procure, and they prefer it at all times to every other plant. In fine weather the sheep are led out to feed on the broom where it grows; but in bad weather the shepherds cut the branches, and bring them to the sheep folds. There is, however, an inconvenience attending the continued use of this food. It generally produces inflammation in the urinary passages. But this inconvenience is easily removed by cooling drink, or a change of food, or by mixing the broom with something else.

It is perhaps needless to add, that it differs much from the broom that is common everywhere in the north of Europe, though this too, in many places, is used for food to cattle. Both of them produce flowers that are very much resorted to by bees, as they contain a great quantity of honey juice. And this should be another inducement to the cultivation of the Spanish broom.

SPARUS, Gilthead, a genus of fishes belonging to the order of *thoracici*. See Ichthyology *Index*. The sparus auratus, or gilthead, was well known to the Romans, who did not esteem them unless they were fed with Lucrine oysters, as Martial informs us,

Non omnis laudem pretiumque AURATA meretur,
Sed qui solus erit concha Lucrina cibus.
Lib. xiii. Ep. 90.

SPASM, a convulsion. See Medicine, n° 278.

SPATHA, in *Botany*, a sheath; a species of calyx which bursts lengthwise, and protrudes a stalk supporting one or more flowers, which commonly have no perianthium or flower-cup.

SPATHACEÆ (from *spatha*, "a sheath"), the name of the ninth order in Linnæus's Fragments of a Natural Method, consisting of plants whose flowers are protruded from a spatha or sheath. See Botany *Index*.

SPATHELIA, a genus of plants belonging to the class of pentandria, and to the order of trigynia. See Botany *Index*.

SPAW. See Spa.

SPAWN, in *Natural History*, the eggs of fishes or frogs.

SPAVENTO. See Scanto.

SPAVIN, in the manege, a disease in horses, being a swelling or stiffness, usually in the ham, occasioning a lameness. See Farriery *Index*.

SPAYING, or Spading, the operation of castrating the females of several kinds of animals, as sows, bitches, &c. to prevent any further conception, and promote their fattening. It is performed by cutting them in the mid flank, on the left side, with a sharp knife or lancet, taking out the uterus, and cutting it off, and so stitching up the wound, anointing the part with tar, and keeping the animal warm for two or three days. The usual way is to make the incision aslope, two inches and a half long; that the fore-finger may be put in towards the back, to feel for the ovaries, which are two kernels as big as acorns on both sides of the uterus, one of which is drawn to the wound, and thus both taken out.

SPEAKER *of the House of Commons*, a member of the house elected by a majority of notes thereof to act as chairman or president in putting questions, reading briefs, or bills, keeping order, reprimanding the refractory, adjourning the house, &c. See Parliament.

SPEAKING, the art or act of expressing one's thoughts in articulate sounds or words. See Grammar, Language, Reading, and Oratory, Part iv.

Speaking-Trumpet. See Trumpet.

SPEAR-Mint. See Mentha, Botany *Index*.

Spear-Wort. See Ranunculus, Botany *Index*.

SPECIAL, something that is particular, or has a particular designation; from the Latin *species*, in opposition to the *general*, from *genus*.

SPECIES, in *Logic*, a relative term, expressing an idea which is comprised under some general one called a *genus*. See Logic, N° 68.

Species, in *Commerce*, the several pieces of gold, silver, copper, &c. which having passed their full preparation

preparation and coinage, are current in public. See MONEY.

SPECIES, in *Algebra*, are the letters, fymbols, marks, or characters, which reprefent the quantities in any operation or equation. This fhort and advantageous way of notation was chiefly introduced by Vieta, about the year 1590; and by means of it he made many difcoveries in algebra, not before taken notice of.

SPECIES, in *Optics*, the image painted on the retina by the rays of light reflected from the feveral points of the furface of an object, received by the pupil, and collected in their paffage through the cryftalline, &c.

It has been a matter of difpute among philofophers, whether the fpecies of objects which give the foul an occafion of feeing, be an effufion of the fubftance of the body; a mere impreffion which they make on all bodies under certain circumftances; or whether they are not fome more fubtile body, fuch as light. The moderns have decided this point by the invention of artificial eyes, in which the fpecies of objects are received on paper, in the fame manner as in the natural eye.

SPECIFIC, in *Philofophy*, that which is peculiar to any thing, and diftinguifhes it from all others.

SPECIFICS, in *Medicine*. By fpecifics is not meant fuch as infallibly and in all patients produce falutary effects. Such medicines are not to be expected, becaufe the operations and effects of remedies are not formally inherent in them, but depend upon the mutual action and reaction of the body and medicine upon each other; hence the various effects of the fame medicine in the fame kind of diforders in different patients, and in the fame patient at different times. By fpecific medicines we underftand fuch medicines as are found to be more uniform in their effects than others in any particular diforder.

SPECIFIC Gravity, is a term much employed in the difcuffions of modern phyfics. It expreffes the weight of any particular kind of matter, as compared with the weight of the fame bulk of fome other body of which the weight is fuppofed to be familiarly known, and is therefore taken for the ftandard of comparifon. The body generally made ufe of for this purpofe is pure water.

The fpecific gravity of bodies is a very interefting queftion both to the philofopher and to the man of bufinefs. The philofopher confiders the weights of bodies as meafures of the number of material atoms, or the quantity of matter which they contain. This he does on the fuppofition that every atom of matter is of the fame weight, whatever may be its fenfible form. This fuppofition, however, is made by him with caution, and he has recourfe to fpecific gravity for afcertaining its truth in various ways. This fhall be confidered by and by. The man of bufinefs entertains no doubt of the matter, and proceeds on it as a fure guide in his moft interefting tranfactions. We meafure commodities of various kinds by tons, pounds, and ounces, in the fame manner as we meafure them by yards, feet, and inches, or by bufhels, gallons, and pints; nay, we do this with much greater confidence, and prefer this meafurement to all others, whenever we are much interefted to know the exact proportions of matter that bodies contain. The weight of a quantity of grain is allowed to inform us much more exactly of its real quantity of ufeful matter than the moft accurate meafure of its bulk. We fee many circumftances which can vary the bulk of a quantity of matter, and thefe are frequently fuch as we cannot regulate or prevent; but we know very few indeed that can make any fenfible change in this weight without the addition or abftraction of other matter. Even taking it to the fummit of a high mountain, or from the equator to the polar region, will make no change in its weight as it is afcertained by the balance, becaufe there is the fame real diminution of weight in the pounds and ounces ufed in the examination.

Notwithftanding the unavoidable change which heat and cold make in the bulk of bodies, and the permanent varieties of the fame kind of matter which are caufed by different circumftances of growth, texture, &c. moft kinds of matter have a certain conftancy in the denfity of their particles, and therefore in the weight of a given bulk. Thus the purity of gold, and its degree of adulteration, may be inferred from its weight, it being purer in proportion as it is more denfe. The denfity, therefore, of different kinds of tangible matter becomes characteriftic of the kind, and a teft of its purity; it marks a particular appearance in which matter exifts, and may therefore be called, with propriety, SPECIFIC.

But this denfity cannot be directly obferved. It is not by comparing the diftances between the atoms of matter in gold and in water that we fay the firft is 19 times denfer than the laft, and that an inch of gold contains 19 times as many material atoms as an inch of water; we reckon on the equal gravitation of every atom of matter whether of gold or of water; therefore the weight of any body becomes the indication of its material denfity, and the weight of a given bulk becomes fpecific of that kind of matter, marking its kind, and even afcertaining its purity in this form.

It is evident that, in order to make this comparifon of general ufe, the ftandard muft be familiarly known, and muft be very uniform in its denfity, and the comparifon of bulk and denfity muft be eafy and accurate. The moft obvious method would be to form, with all nicety, a piece of the ftandard matter of fome convenient bulk, and to weigh it very exactly, and keep a note of its weight: then, to make the comparifon of any other fubftance, it muft be made into a mafs of the fame precife bulk, and weighed with equal care; and the moft convenient way of expreffing the fpecific gravity would be to confider the weight of the ftandard as unity, and then the number expreffing the fpecific gravity is the number of times that the weight of the ftandard is contained in that of the other fubftance. This comparifon is moft eafily and accurately made in fluids. We have only to make a veffel of known dimenfions equal to that of the ftandard which we employ, and to weigh it when empty, and then when filled with the fluid. Nay, the moft difficult part of the procefs, the making a veffel of the precife dimenfions of the ftandard, may be avoided, by ufing fome fluid fubftance for a ftandard. Any veffel will then do; and we may enfure very great accuracy by ufing a veffel with a flender neck, fuch as a phial or matrafs; for when this is filled to a certain mark in the neck, any error in the eftimation by the eye will bear a very fmall proportion to the whole. The weight of the ftandard fluid which fills it to this mark being carefully afcertained, is kept in remembrance. The fpecific gravity of any other fluid is had by weighing the contents of this veffel when filled with it, and dividing

dividing the weight by the weight of the ſtandard. The quotient is the ſpecific gravity of the fluid. But in all other caſes this is a very difficult problem : it requires very nice hands, and an accurate eye, to make two bodies of the ſame bulk. An error of one hundredth part in the linear dimenſions of a ſolid body makes an error of a 30th part in its bulk; and bodies of irregular ſhapes and friable ſubſtance, ſuch as the ores of metals, cannot be brought into convenient and exact dimenſions for meaſurement.

From all theſe inconveniences and difficulties we are freed by the celebrated Archimedes, who, from the principles of hydroſtatics diſcovered or eſtabliſhed by him, deduced the accurate and eaſy method which is now univerſally practiſed for diſcovering the ſpecific gravity and denſity of bodies. (See ARCHIMEDES and HYDRODYNAMICS). Inſtead of meaſuring the bulk of the body by that of the diſplaced fluid (which would have been impoſſible for Archimedes to do with any thing like the neceſſary preciſion), we have only to obſerve the loſs of weight ſuſtained by the ſolid. This can be done with great eaſe and exactneſs. Whatever may be the bulk of the body, this loſs of weight is the weight of an equal bulk of the fluid ; and we obtain the ſpecific gravity of the body by ſimply dividing its whole weight by the weight loſt : the quotient is the ſpecific gravity when this fluid is taken for the ſtandard, even though we ſhould not know the abſolute weight of any given bulk of this ſtandard. It alſo gives us an eaſy and accurate method of aſcertaining even this fundamental point. We have only to form any ſolid body into an exact cube, ſphere, or priſm, of known dimenſions, and obſerve what weight it loſes when immerſed in this ſtandard fluid. This is the weight of the ſame bulk of the ſtandard to be kept in remembrance ; and thus we obtain, by the bye, a moſt eaſy and accurate method for meaſuring the bulk or ſolid contents of any body, however irregular its ſhape may be. We have only to ſee how much weight it loſes in the ſtandard fluid ; we can compute what quantity of the ſtandard fluid will have this weight. Thus ſhould we find that a quantity of ſand, or a furze buſh, loſes 250 ounces when immerſed in pure water, we learn by this that the ſolid meaſure of every grain of the ſand, or of every twig and prickle of the furze, when added into one ſum, amounts to the fourth part of a cubic foot, or to 432 cubic inches.

To all theſe advantages of the Archimedean method of aſcertaining the ſpecific gravity of bodies, derived from his hydroſtatical doctrines and diſcoveries, we may add, that the immediate ſtandard of compariſon, namely, water, is, of all the ſubſtances that we know, the fitteſt for the purpoſe of an univerſal ſtandard of reference. In its ordinary natural ſtate it is ſufficiently conſtant and uniform in its weight for every examination where the utmoſt mathematical accuracy is not wanted ; all its variations ariſe from impurities, from which it may at all times be ſeparated by the ſimple proceſs of diſtillation : and we have every reaſon to think that when pure, its denſity, when of the ſame temperature, is invariable.

Water is therefore univerſally taken for the unit of that ſcale on which we meaſure the ſpecific gravity of bodies, and its weight is called 1. The ſpecific gravity of any other body is the real weight in pounds and ounces, when of the bulk of one pound or one ounce of water. It is therefore of the firſt importance, in all diſcuſſions reſpecting the ſpecific gravity of bodies, to have the preciſe weight of ſome known bulk of pure water. We have taken ſome pains to examine and compare the experiments on this ſubject, and ſhall endeavour to aſcertain this point with the preciſion which it deſerves. We ſhall reduce all to the Engliſh cubic foot and avoirdupois ounce of the Exchequer ſtandard, on account of a very convenient circumſtance peculiar to this unit, viz. that a cubic foot contains almoſt preciſely a thouſand ounces of pure water, ſo that the ſpecific gravity of bodies expreſſes the number of ſuch ounces contained in a cubic foot.

We begin with a trial made before the houſe of commons in 1696 by Mr Everard. He weighed 2145.6 cubic inches of water by a balance, which turned ſenſibly with 6 grains, when there were 30 pounds in each ſcale. The weights employed were the troy weights, in the depoſit of the Court of Exchequer, which are ſtill preſerved, and have been moſt ſcrupulouſly examined and compared with each other. The weight was 1131 ounces 14 pennyweights. This wants juſt 11 grains of a thouſand avoirdupois ounces for 1728 cubic inches, or a cubic foot ; and it would have amounted to that weight had it been a degree or two colder. The temperature indeed is not mentioned ; but as the trial was made in a comfortable room, we may preſume the temperature to have been about 55° of Fahrenheit's thermometer. The dimenſions of the veſſel were as accurate as the nice hand of Mr Abraham Sharp, Mr Flamſtead's aſſiſtant at Greenwich, could execute, and it was made by the Exchequer ſtandard of length.

This is confided in by the naturaliſts of Europe as a very accurate ſtandard experiment, and it is confirmed by many others both private and public. The ſtandards of weight and capacity employed in the experiment are ſtill in exiſtence, and publicly known, by the report of the Royal Society to parliament in 1742, and by the report of a committee of the houſe of commons in 1758. This gives it a ſuperiority over all the meaſures which have come to our knowledge.

The firſt experiment, made with proper attention, that we meet with, is by the celebrated Snellius, about the year 1615, and related in his *Eratoſthenes Batavus*. He weighed a Rhinland cubic foot of diſtilled water, and found it 62.79 Amſterdam pounds. If this was the ordinary weight of the ſhops, containing 7626 Engliſh troy grains, the Engliſh cubic foot muſt be 62 pounds 9 ounces, only one ounce more than by Everard's experiment. If it was the Mint pound, the weight was 62 pounds 6 ounces. The only other trials which can come into competition with Mr Everard's are ſome made by the Academy of Sciences at Paris. Picart, in 1691, found the Paris cubic foot of the water of the fountain d'Arcueil to weigh 69.588 pounds, *poids de Paris*. Du Hamel obtained the very ſame reſult ; but Mr Monge, in 1783, ſays that filtered rain-water of the temperature 12° (Reaumur) weighs 69.3792. Both theſe meaſures are conſiderably below Mr Everard's, which is 62.5, the former giving 62.053, and the latter 61.868. M. Lavoiſier ſtates the Paris cubic foot at 70 pounds, which makes the Engliſh foot 62.47. But there is an inconſiſtency

Specific Gravity.

fiftency among them which makes the comparifon impoffible. Some changes were made in 1688, by royal authority, in the national ftandards, both of weight and length; and the academicians are exceedingly puzzled to this day in reconciling the differences, and cannot even afcertain with perfect affurance the lineal meafures which were employed in their moft boafted geodetical operations.

Such variations in the meafurements made by perfons of reputation for judgement and accuracy engaged the writer of this article fome years ago to attempt another. A veffel was made of a cylindrical form, as being more eafily executed with accuracy, whofe height and diameter were 6 inches, taken from a moft accurate copy of the Exchequer ftandard. It was weighed in diftilled water of the temperature 55° feveral times without varying 2 grains, and it loft 42895 grains. This gives for the cubic foot 998.74 ounces, deficient from Mr Everard's an ounce and a quarter; a difference which may be expected, fince Mr Everard ufed the New River water without diftillation.

We hope that thefe obfervations will not be thought fuperfluous in a matter of fuch continual reference, in the moft interefting queftions both to the philofopher and the man of bufinefs; and that the determination which we have given will be confidered as fufficiently authenticated.

Let us, therefore, for the future take water for the ftandard, and fuppofe that, when of the ordinary temperature of fummer, and in its ftate of greateft natural purity, viz. in clean rain or fnow, an Englifh cubic foot of it weighs a thoufand avoirdupois ounces of 437.5 troy grains each. Divide the weight of any body by the weight of an equal bulk of water, the quotient is the fpecific gravity of that body; and if the three firft figures of the decimal be accounted integers, the quotient is the number of avoirdupois ounces in a cubic foot of the body. Thus the fpecific gravity of the very fineft gold which the refiner can produce is 19.365, and a cubic foot of it weighs 19365 ounces.

But an important remark muft be made here. All bodies of homogeneous or unorganifed texture expand by heat, and contract by cooling. The expanfion and contraction by the fame change of temperature is very different in different bodies. Thus water, when heated from 60° to 100°, increafes its volume nearly $\frac{1}{167}$ of its bulk, and mercury only $\frac{1}{241}$, and many fubftances much lefs. Hence it follows, that an experiment determines the fpecific gravity only in that very temperature in which the bodies are examined. It will therefore be proper always to note this temperature; and it will be convenient to adopt fome very ufeful temperature for fuch trials in general: perhaps about 60° of Fahrenheit's thermometer is as convenient as any. It may always be procured in thefe climates without inconvenience. A temperature near to freezing would have fome advantages, becaufe water changes its bulk very little between the temperature 32° and 45°. But this temperature cannot always be obtained. It will much conduce to the facility of the comparifon to know the variation which heat produces on pure water. The following table, taken from the obfervations of Dr Blagden and Mr Gilpin (Phil. Tranf. 1792) will anfwer this purpofe.

Temperature of Water.	Bulk of Water.	Specific Gravity.
30		
35	99910	1.00090
40	99070	1.00094
45	99914	1.00086
50	99932	1.00068
55	99962	1.00038
60	100000	1.00000
65	100050	0.99950
70	100106	0.99894
75	100171	0.99830
80	100242	0.99759
85	100320	0.99681
90	100404	0.99598
95	100501	0.99502
100	100602	0.99402

Thofe gentlemen obferved the expanfion of water to be very anomalous between 32° and 45°. This is diftinctly feen during the gradual cooling of water to the point of freezing. It contracts for a while, and then fuddenly expands. But we feldom have occafion to meafure fpecific gravities in fuch temperature.

The reader is now fufficiently acquainted with the principles of this hydroftatical method of determining the fpecific gravity of bodies, and can judge of the propriety of the forms which may be propofed for the experiment.

The fpecific gravity of a fluid may be determined either by filling with it a veffel with a narrow neck, or by weighing a folid body that is immerfed in it. It is hard to fay which is the beft way. The laft is not fubject to any error in filling, becaufe we may fufpend the folid by a fine wire, which will not difplace any fenfible quantity of the fluid; and if the folid is but a little heavier than the fluid, the balance being loaded only with the excefs, will be very fenfible to the fmalleft want of equilibrium. But this advantage is perhaps compenfated by an obftruction to the motion of the folid up or down in the fluid, arifing from vifcidity. When the weight in the oppofite fcale is yet too fmall, we flowly add more, and at laft grain by grain, which gradually brings the beam to the level. When it is exactly level, the weight in the fcale is fomewhat too great; for it not only balances the preponderance of the folid, but alfo this vifcidity of the fluid. But we may get rid of this error. Add a fmall quantity more; this will bring the beam over to the other fide. Now put as much into the fcale on the fame fide with the folid; this will not reftore the beam to its level. We muft add more till this be accomplifhed; and this addition is the meafure of the vifcidity of the fluid, and muft be fubtracted from the weight that was in the other fcale when the beam came *firft* to a level. This effect of vifcidity is not infenfible, with nice apparatus, even in the pureft water, and in many fluids it is very confiderable—and, what is worfe, it is very changeable. It is greatly diminifhed by heat; and this is an additional reafon for making

Specific Gravity.

making those trials in pretty warm temperatures. But for fluids of which the viscidity is considerable, this method is by no means proper; and we must take the other, and weigh them in a vessel with a narrow neck. Mercury must also be treated in this way, because we have no solid that will sink in it but gold and platina.

It is not so easy as one would imagine to fill a vessel precisely to the same degree upon every trial. But if we do not operate on too small quantities, the unavoidable error may be made altogether insignificant, by having the neck of the vessel very small. If the vessel hold a pound of water, and the neck do not exceed a quarter of an inch (and it will not greatly retard the operation to have it half this size), the examinator must be very careless indeed to err one part in two thousand; and this is perhaps as near as we can come with a balance. We must always recollect that the capacity of the vessel changes by heat, and we must know this variation, and take it into the account. But it is affectation to regard (as Mr Homberg would make us believe that he did) the distension of the vessel by the pressure of the fluid. His experiments of this kind have by no means the consistency with each other that should convince us that he did not commit much greater errors than what arose from distension.

In examining either solids or fluids, we must be careful to free their surface, or that of the vessel in which the fluid is to be weighed, from air, which frequently adheres to it in a peculiar manner, and, by forming a bubble, increases the apparent bulk of the solid, or diminishes the capacity of the vessel. The greatest part of what appears on those occasions seems to have existed in the fluid in a state of chemical union, and to be set at liberty by the superior attraction of the fluid for the contiguous solid body. These air bubbles must be carefully brushed off by hand. All greasy matters must be cleared off for the same reason: they prevent the fluid from coming into contact.

We must be no less careful that no water is imbibed by the solid, which would increase its weight without increasing its bulk. In some cases, however, a very long maceration and imbibition is necessary. Thus, in examining the specific gravity of the fibrous part of vegetables, we should err exceedingly if we imagined it as small as appears at first. We believe that in most plants it is at least as great as water, for after long maceration they sink in it.

It is almost needless to say that the nicest and most sensible balances are necessary for this examination. Balances are even constructed on purpose, and fitted with several pieces of apparatus, which make the examination easy and neat. We have described (see BALANCE) Mr Gravesande's as one of the most convenient of any. His contrivance for observing the fractions of a grain is extremely ingenious and expeditious, especially for detecting the effect of viscidity.

The hydrometer, or areometer, is another instrument for ascertaining the specific gravity of fluids. This very pretty instrument is the invention of a lady, as eminent for intellectual accomplishments as she was admired for her beauty. Hypatia, the learned daughter of the celebrated mathematician Theon of Alexandria, became so eminent for her mathematical knowledge, that she was made public professor of the science in the first school in the world. She wrote a commentary on the works of Apollonius and of Diophantus, and composed Astronomical Tables; all of which are lost. These rare accomplishments, however, could not save her from the fury of the fanatics of Alexandria, who cut her in pieces for having taken an offensive part in a dispute between the governor and patriarch.—We have described some of the most approved of these instruments in the article HYDROMETER, and shall in this place make a few observations on the principles of their construction, not as they are usually made, accommodated to the examination of particular liquors, but as indicators of pure specific gravity. And we must premise, that this would, for many reasons, be the best way of constructing them. The very ingenious contrivances for accommodating them to particular purposes are unavoidably attended with many sources of error, both in their adjustment by the maker and in their use; and all that is gained by a very expensive instrument is the saving the trouble of inspecting a table. A simple scale of specific gravity would expose to no error in construction, because all the weights but one, or all the points of the scale but one, are to be obtained by calculation, which is incomparably more exact than any manual operation, and the table can always be more exact than any complex observation. But a still greater advantage is, that the instruments would by this means be fitted for examining all liquors whatever, whereas at present they are almost useless for any but the one for which they are constructed.

Hydrometers are of two kinds. The most simple and the most delicate are just a substitute for the hydrostatical balance. They consist of a ball (or rather an egg or pear-shaped vessel, which moves more easily through the fluid) A (fig. 1.) having a foot projecting down from it, terminated by another ball B, and a slender stalk or wire above, carrying a little dish C. The whole is made so light as to float in the lightest fluid we are acquainted with; such as vitriolic or muriatic ether, whose specific gravity is only 0.73. This number should be marked on the dish, indicating that this is the specific gravity of the fluid in which the instrument floats, sinking to the point D of the stem. The ball B is made heavy, and the foot is of some length, that the instrument may have stability, and swim erect, even if considerably loaded above; and, for the same reason, it must be made very round, otherwise it will lean to a side. When put into a heavier liquor, its buoyancy will cause it to float with a part of the ball above the surface. Weights are now put into the scale C, till the instrument sink to D. The weight put into the scale, added to the weight of the instrument, is the weight of the displaced fluid. This, compared with the weight of the whole when the instrument is swimming in pure water, gives the specific gravity of the fluid. All trouble of calculation may be avoided by marking the weights with such numbers as shall indicate the specific gravity at once. Thus having loaded the instrument so as to sink it to D in pure water, call the whole weight 1000; then weigh the instrument itself, and say, "as the weight when swimming in water is to its present weight, so is 1000 to a 4th proportional." This is the specific gravity of the liquor which would float the unloaded instrument. Suppose this to be 730. The hydrometer would just float in muriatic ether, and this should be marked on the side. Now make a set of small weights,

weights, and mark them, not by their weights in grains, but in fuch units that 270 of them fhall be equal to the weight which fits the inftrument for pure water.

Suppofe that, in order to float this inftrument in a certain brandy, there are required 186 in thefe fmall weights. This added to 730 gives 916 for the fpecific gravity, and fhows it to be precifely excife proof fpirit. Nine weights, viz. 256, 128, 64, 32, 16, 8, 4, 2, 1, will fuffice for all liquors from ether to the ftrongeft worts. And that the trouble in changing the weights may be greatly leffened, let a few circles a, b, c, d, e, be marked on the top of the ball. When we fee it float unloaded at the circle C for inftance, we know it will require at leaft 128 to fink it to D on the ftem.

If the weights to be added above are confiderable, it raifes the centre of gravity fo much, that a fmall want of equilibrium, by laying the weights on one fide, will produce a great inclination of the inftrument, which is unfightly. Inftead therefore of making them loofe weights, it is proper to make them round plates, with a fmall hole in the middle, to go on a pin in the middle of the fcale. This will keep the inftrument always upright. But unlefs the hydrometer is of a confiderable fize, it can hardly be made fo as to extend from the lighteft to the heavieft fluid which we may have occafion to examine, even though we except mercury. Some of the mineral acids are confiderably more than twice the weight of ether. When there is fuch a load at top, the hydrometer is very apt to overfet, and inclines with the fmalleft want of equilibrium. Great fize is inconvenient even to the philofopher, becaufe it is not always in his power to operate on a quantity of fluid fufficient to float the inftrument. Therefore two, or perhaps three, are neceffary for general examination. One may reach from ether to water; another may ferve for all liquors of a fpecific gravity between one and one and a half; and the third, for the mineral acids, may reach from this to two. If each of thefe be about two folid inches in capacity, we may eafily and expeditioufly determine the fpecific gravity within one ten thoufandth part of the truth: and this is precifion enough for moft purpofes of fcience or bufinefs.

The chief queftions are, 1. To afcertain the fpecific gravity of an unknown fluid. This needs no farther explanation. 2. To afcertain the proportion of two fluids which are known to be in a mixture. This is done by difcovering the fpecific gravity of the mixture by means of the hydrometer, and then deducing the proportion from a comparifon of this with the fpecific gravities of the ingredients.

In this mode of examination the bulk is always the fame; for the hydrometer is immerged in the different fluids to the fame depth. Now if an inch, for example, of this bulk is made up of the heavieft fluid, there is an inch wanting of the lighteft; and the change made in the weight of the mixture is the difference between the weight of an inch of the heavieft, and of an inch of the lighteft ingredients. The number of inches therefore of the heavieft fluid is proportional to the addition made to the weight of the mixture. Therefore let B and b be the bulks of the heavieft and lighteft fluids in the bulk β of the mixture; and let D, d, and δ be the denfities, or the weights, or the fpecific gravities (for they are in one ratio) of the heavy fluid, the light fluid, and the mixture (their bulk being that of the hydrometer). We have $\beta = B + b$. The addition which would have been made to the bulk β, if the lighteft fluid were changed entirely for the heavieft, would be $D - d$; and the change which is really made is $\delta - d$. Therefore $\beta : b = D - d : \delta - d$. For fimilar reafons we fhould have $\beta : B = D - d : D - \delta$; or, in words, "*the difference between the fpecific gravities of the two fluids, is to the difference between the fpecific gravities of the mixture and of the lighteft fluid, as the bulk of the whole to the bulk of the heavieft contained in the mixture;*" and "*the difference of the fpecific gravities of the two fluids, is to the difference of the fpecific gravities of the mixture and of the heavieft fluids, as the bulk of the whole to that of the lighteft contained in the mixture.*" This is the form in which the ordinary bufinefs of life requires the anfwer to be expreffed, becaufe we generally reckon the quantity of liquors by bulk, in gallons, pints, quarts. But it would have been equally eafy to have obtained the anfwer in pounds and ounces; or it may be had from their bulk, fince we know their fpecific gravities.

The hydrometer more commonly ufed is the ancient one of Hypatia, confifting of a ball A (fig. 2.) made fteady by an addition B, below it like the former, but having a long ftem CF above. It is fo loaded that it finks to the top F of the ftem in the lighteft of all the fluids which we propofe to meafure with it, and to fink only to C in the heavieft. In a fluid of intermediate fpecific gravity it will fink to fome point between C and F.

In this form of the hydrometer the weight is always the fame, and the immediate information given by the inftrument is that of different bulks with equal weight. Becaufe the inftrument finks till the bulk of the difplaced fluid equals it in weight, and the additions to the difplaced fluid are all made by the ftem, it is evident that equal bulks of the ftem indicate equal additions of volume. Thus the ftem becomes a fcale of bulks to the fame weight.

The only form in which the ftem can be made with fufficient accuracy is cylindrical or prifmatical. Such a ftem may be made in the moft accurate manner by wiredrawing, that is, paffing it through a hole made in a hardened fteel plate. If fuch a ftem be divided into equal parts, it becomes a fcale of bulks in arithmetical progreffion. This is the eafieft and moft natural divifion of the fcale; but it will not indicate denfities, fpecific gravities, or weights of the fame bulk in arithmetical progreffion. The fpecific gravity is as the weight divided by the bulk. Now a feries of divifors (the bulks), in arithmetical progreffion, applied to the fame dividend (the bulk and weight of the hydrometer as it floats in water), will not give a feries of quotients (the fpecific gravities) in arithmetical progreffion: they will be in what is called *harmonic progreffion*, their differences continually diminifhing. This will appear even when phyfically confidered. When the hydrometer finks a tenth of an inch near the top of the ftem, it difplaces one tenth of an inch of a light fluid, compared with that difplaced by it when it is floating with all the ftem above the furface. In order therefore that the divifions of the ftem may indicate equal changes of fpecific gravity, they muft be in a feries of harmonic progreffionals increafing. The point at which the inftrument floats in pure water fhould be marked 1000, and thofe above it 999, 998, 997, &c.; and thofe

SPECIFIC Gravity

thoſe below the water mark muſt be numbered 1001, 1002, 1003, &c. Such a ſcale will be a very appoſite picture of the denſities of fluids, for the denſity or vicinity of the diviſions will be preciſely ſimilar to the denſity of the fluids. Each interval is a bulk of fluid of the ſame weight. If the whole inſtrument were drawn out into wire of the ſize of the ſtem, the length from the water mark would be 1000.

Such are the rules by which the ſcale muſt be divided. But there muſt be ſome points of it determined by experiment, and it will be proper to take them as remote from each other as poſſible. For this purpoſe let the inſtrument be accurately marked at the point where it ſtands, in two fluids, differing as much in ſpecific gravity as the inſtrument will admit. Let it alſo be marked where it ſtands in water. Then determine with the utmoſt preciſion the ſpecific gravities of theſe fluids, and put their values at the correſponding points of the ſcale. Then the intermediate points of the ſcale muſt be computed for the different intervening ſpecific gravities, or it muſt be divided from a pattern ſcale of harmonic progreſſionals in a way well known to the mathematical inſtrument-makers. If the ſpecific gravities have been accurately determined, the value 1000 will be found to fall preciſely in the water mark. If we attempt the diviſion entirely by experiment, by making a number of fluids of different ſpecific gravities, and marking the ſtem as it ſtands in them, we ſhall find the diviſions turn out very anomalous. This is however the way uſually practiſed; and there are few hydrometers, even from the beſt maker, that hold true to a ſingle diviſion or two. Yet the method by computation is not more troubleſome; and one ſcale of harmonic progreſſionals will ſerve to divide every ſtem that offers. We may make uſe of a ſcale of equal parts for the ſtem, with the aſſiſtance of two little tables. One of theſe contains the ſpecific gravities in harmonic progreſſion, correſponding to the arithmetical ſcale of bulks on the ſtem of the hydrometer; the other contains the diviſions and fractions of a diviſion of the ſcale of bulks, which correſpond to an arithmetical ſcale of ſpecific gravities. We believe this to be the beſt method of all. The ſcale of equal parts on the ſtem is ſo eaſily made, and the little table is ſo eaſily inſpected, that it has every advantage of accuracy and diſpatch, and it gives, by the way, an amuſing view of the relation of the bulks and denſities.

We have hitherto ſuppoſed a ſcale extending from the lighteſt to the heavieſt fluid. But unleſs it be of a very inconvenient length, the diviſions muſt be very minute. Moreover, when the bulk of the ſtem bears a great proportion to that of the body, the inſtrument does not ſwim ſteady; it is therefore proper to limit the range of the inſtrument in the ſame manner as thoſe of the firſt kind. A range from the denſity of ether to that of water may be very well executed in an inſtrument of very moderate ſize, and two others will do for all the heavier liquors; or an equal range in any other denſities as may ſuit the uſual occupations of the experimenter.

To avoid the inconveniences of a hydrometer with a very long and ſlender ſtem, or the neceſſity of having a ſeries of them, a third ſort has been contrived, in which the principles of both are combined. Suppoſe a hydrometer with a ſtem, whoſe bulk is $\frac{1}{10}$th of that of the ball, and that it ſinks in ether to the top of the ſtem; it is evident that in a fluid which is $\frac{1}{10}$th heavier, the whole ſtem will emerge; for the bulk of the diſplaced fluid is now $\frac{1}{10}$th of the whole leſs, and the weight is the ſame as before, and therefore the ſpecific gravity is $\frac{1}{10}$th greater.

Thus we have obtained a hydrometer which will indicate, by means of diviſions marked on the ſtem, all ſpecific gravities from 0.73 to 0.803; for 0.803 is $\frac{1}{10}$th greater than 0.73. Theſe diviſions muſt be made in harmonic progreſſion, as before directed for an entire ſcale, placing 0.73 at the top of the ſtem and 0.803 at the bottom.

When it floats at the loweſt diviſion, a weight may be put on the top of the ſtem, which will again ſink it to the top. This weight muſt evidently be 0.073, or $\frac{1}{10}$th of the weight of the fluid diſplaced by the unloaded inſtrument. The hydrometer, thus loaded, indicates the ſame ſpecific gravity, by the top of the ſtem, that the unloaded inſtrument indicates by the loweſt diviſion. Therefore, when loaded, it will indicate another ſeries of ſpecific gravities, from 0.803 to 0.8833 (= 0.803 + 0.0803), and will float in a liquor of the ſpecific gravity 0.8833 with the whole ſtem above the ſurface.

In like manner, if we take off this weight, and put on 1 = 0.0803, it will ſink the hydrometer to the top of the ſtem; and with this new weight it will indicate another ſeries of ſpecific gravities from 0.8833 to 0.97163 (= 0.8833 + 0.08833). And, in the ſame manner, a third weight = 08833 will again ſink it to the top of the ſtem, and fit it for another ſeries of ſpecific gravities up to 1.068793. And thus, with three weights, we have procured a hydrometer fitted for all liquors from ether to a wort for a malt liquor of two barrels per quarter. Another weight, in the ſame progreſſion, will extend the inſtrument to the ſtrongeſt wort that is brewed.

This is a very commodious form of the inſtrument, and is now in very general uſe for examining ſpirituous liquors, worts, ales, brines, and many ſuch articles of commerce. But the diviſions of the ſcale are generally adapted to the queſtions which naturally occur in the buſineſs. Thus, in the commerce of ſtrong liquors, it is uſual to eſtimate the article by the quantity of ſpirit of a certain ſtrength which the liquor contains.—This we have been accuſtomed to call proof ſpirit, and it is ſuch that a wine gallon weighs 7 pounds 12 ounces, and it is by this ſtrength that the exciſe duties are levied. Therefore the diviſions on the ſcale, and the weights which connect the ſucceſſive repetitions of the ſcale, are made to expreſs at once the number of gallons or parts of a gallon of proof ſpirits contained in a gallon of the liquor. Such inſtruments ſave all trouble of calculation to the exciſeman or dealer; but they limit the uſe of a very delicate and expenſive inſtrument to a very narrow employment. It would be much better to adhere to the expreſſion either of ſpecific gravity or of bulk; and then a very ſmall table, which could be compriſed in the ſmalleſt caſe for the inſtrument, might render it applicable to every kind of fluid.

The reader cannot but have obſerved that the ſucceſſive weights, by which the ſhort ſcale of the inſtrument is extended to a great range of ſpecific gravities, do not increaſe by equal quantities. Each difference is the weight of the liquor diſplaced by the graduated ſtem of the inſtrument when it is ſunk to the top of the

the ſcale. It is a determined aliquot part of the whole weight of the inſtrument ſo loaded, (in our example it is always $\frac{1}{11}$th of it). It increaſes therefore in the ſame proportion with the preceding weight of the loaded inſtrument. In ſhort, both the ſucceſſive additions, and the whole weights of the loaded inſtrument, are quantities in geometrical progreſſion; and, in like manner, the diviſions on the ſcale, if they correſpond to equal differences of ſpecific gravity, muſt alſo be unequal—This is not ſufficiently attended to by the makers; and they commit an error here, which is very conſiderable when the whole range of the inſtrument is great. For the value of one diviſion of the ſcale, when the largeſt weight is on, is as much greater than its value, when the inſtrument is not loaded at all, as the full loaded inſtrument is heavier than the inſtrument unloaded. No manner whatever of dividing the ſcale will correſpond to equal differences of ſpecific gravity through the whole range with different weights; but if the diviſions are made to indicate equal *proportions* of gravity when the inſtrument is uſed without a weight, they will indicate equal *proportions* throughout. This is evident from what we have been juſt now ſaying; for the proportion of the ſpecific gravities correſponding to any two immediately ſucceeding weights is always the ſame.

The beſt way, therefore, of conſtructing the inſtrument, ſo that the ſame diviſions of the ſcale may be accurate in all its ſucceſſive repetitions with the different weights, is to make theſe diviſions in geometrical progreſſion. The correſponding ſpecific gravities will alſo be in geometric proportion. Theſe being all inſerted in a table, we obtain them with no more trouble than by inſpecting the ſcale which uſually accompanies the hydrometer. This table is of the moſt eaſy conſtruction; for the ratio of the ſucceſſive bulks and ſpecific gravities being all equal, the differences of the logarithms are equal.

This will be illuſtrated by applying it to the example already given of a hydrometer extending from 0.73 to 1.068793 with three weights. This gives four repetitions of the ſcale on the ſtem. Suppoſe this ſcale divided into 10 parts, we have 40 ſpecific gravities.—Let theſe be indicated by the numbers 0, 1, 2, 3, &c. to 40. The mark 0 is affixed to the top of the ſtem, and the diviſions downwards are marked 1, 2, 3, &c. the loweſt being 10. Theſe diviſions are eaſily determined. The ſtem, which we may ſuppoſe 5 inches long, was ſuppoſed to be $\frac{1}{10}$th of the capacity of the ball. It may therefore be conſidered as the extremity of a rod of 11 times its length, or 55 inches; and we muſt find nine mean proportionals between 50 and 55 inches. Subtract each of theſe from 55 inches, and the remainders are the diſtances of the points of diviſion from 0, the top of the ſcale. The ſmalleſt weight is marked 10, the next 20, and the third 30. If the inſtrument loaded with the weight 20 ſinks in ſome liquor to the mark 7, it indicates the ſpecific gravity 27, that is, the 27th of 40 mean proportionals between 0.73 and 1.068793, or 0.944242. To obtain all theſe intermediate ſpecific gravities, we have only to ſubtract 9.8633229, the logarithm of 0.73, from that of 1.068793, viz. 0.0288937, and take 0.0041393, the 40th part of the difference. Multiply this by 1, 2, 3, &c. and add the logarithm of 0.73 to each of the products. The ſums are the logarithms of the ſpecific gravities required. Theſe will be found to proceed ſo equably, that they may be interpolated ten times by a ſimple table of proportional parts without the ſmalleſt ſenſible error. Therefore the ſtem may be divided into a hundred parts very ſenſible to the eye (each being nearly the 20th of an inch), and 406 degrees of ſpecific gravity obtained within the range, which is as near as we can examine this matter by any hydrometer. Thus the ſpecific gravities correſponding to N° 26, 27, 28, 29, are as follow:

		1ſt Diff.	2d Diff.
26	0.93529		
27	0.94424	895	
28	0.95328	904	9
29	0.96241	913	9

Nay, the trouble of inſpecting a table may be avoided, by forming on a ſcale the logarithms of the numbers between 7300 and 1068.793, and placing along ſide of it a ſcale of the ſame length divided into 400 equal parts, numbered from 0 to 400. Then, looking for the mark ſhown by the hydrometer on this ſcale of equal parts, we ſee oppoſite to it the ſpecific gravity.

We have been thus particular in the illuſtration of this mode of conſtruction, becauſe it is really a beautiful and commodious inſtrument, which may be of great uſe both to the naturaliſt and to the man of buſineſs.—A table may be compriſed in 20 octavo pages, which will contain the ſpecific gravities of every fluid which can intereſt either, and anſwer every queſtion relative to their admixture with as much preciſion as the obſervations can be made. We therefore recommend it to our readers, and we recommend the very example which we have given as one of the moſt convenient. The inſtrument need not exceed eight inches in length, and may be contained in a pocket caſe of two inches broad and as many deep, which will alſo contain the ſcale, a thermometer, and even the table for applying it to all fluids which have been examined.

It is unfortunate that no graduated hydrometer can be made ſo eaſily for the examination of the corroſive mineral acids (A). Theſe muſt be made of glaſs, and we cannot depend on the accurate cylindric form of any glaſs ſtem. But if any ſuch can be procured, the conſtruction is the ſame. The divided ſcale may either be on thin paper paſted on the inſide of the ſtem, or it may be printed on the ſtem itſelf from a plate, with ink made of a metallic calx, which will attach itſelf to the glaſs with a very moderate heat. We would recommend common white enamel, or arſenical glaſs, as the fitteſt material for the whole inſtrument; and the ink uſed, in taking the impreſſion of the ſcale, may be the ſame that is uſed for the low-priced printing on Delft ware pottery.—Firſt form the ſcale on the ſtem. Then, having meaſured the ſolid contents of the graduated part as exactly as poſſible, and determined on the general ſhape of

(A) It would be worth while to try copper enamelled.

of the ball and counterpoife below, calculate its fize, fo that it may be a little lefs than ten times that of the ftem. The glafs-blower can copy this very nearly, and join it to the ftem. Then make two brines or other liquors, which fhall have fpecific gravities in the ratio of 10 to 11. Load the inftrument fo that it may fink to 0 in the lighteft. When put into the heavieft, it fhould rife to 10. If it does not rife fo high, the immerfed part is too fmall. Let the glafs-blower enlarge the ball of the counterpoife a little. Repeat this trial till it be exact. Nothing now remains but to form the weights: And here we obferve, that when the inftrument is to have a very great range, as for examining all ftates of the vitriolic acid, it has a chance of being very tottering when loaded with the greateft weight on the top of fo long a fcale. To avoid this, Mr Quin and others have added fome of their weights below.—But this will not fuit the prefent conftruction, becaufe it will alter the proportion between the bulks of the ftem and immerfed part. Therefore let thefe weights confift of cylinders of metal fmall enough to go into the ftem, and let them be foldered to the end of long wires, which will let them go to the bottom, and leave a fmall hook or ring at top. Thefe can lie alongfide of the inftrument in its cafe. This is indeed the beft conftruction for every hydrometer, becaufe it makes it incomparably more fteady. The inftrument is poifed by fmall fhot or mercury. But it will be much better to do it with Newton's fufible metal (three parts of tin, five parts of lead, and eight parts of bifmuth) in coarfe filings. When the exact quantity has been put in, the inftrument may be fet in a veffel of oil, and this kept on the fire till all is completely melted. It foon freezes again, and remains faft. If this metal is not to be had, let a few bits of fealing-wax be added to the mercury or fhot, to make up the counterpoife. When heated, it will float a-top, and when it freezes again it will keep all faft. Thus we fhall make a very complete and cheap inftrument.

There is yet another method of examining the fpecific gravities of fluids, firft propofed by Dr Wilfon, late profeffor of aftronomy in the univerfity of Glafgow. This is by a feries of fmall glafs bubbles, differing equally, or according to fome rule, from each other in fpecific gravity, and each marked with its proper number. When thefe are thrown into a fluid which is to be examined, all thofe which are heavier than the fluid will fall to the bottom. Then holding the veffel in the hand, or near a fire or candle, the fluid expands, and one of the floating bubbles begins to fink. Its fpecific gravity, therefore was either equal to, or a little lefs than, that of the fluid; and the degree of the thermometer, when it began to fink, will inform us how much it was deficient, if we know the law of expanfion of the liquor. Sets of thefe bubbles fitted for the examination of fpirituous liquors, with a little treatife fhowing the manner of ufing them, and calculating by the thermometer, are made by Mr Brown, an ingenious artift of Glafgow, and are often ufed by the dealers in fpirits, being found both accurate and expeditious.

Alfo, though a bubble or two fhould be broken, the ftrength of fpirits may eafily be had by means of the remainder, unlefs two or three in immediate fucceffion be wanting: for a liquor which anfwers to N° 4 will fink N° 2. by heating it a few degrees, and therefore N° 3. may be fpared. This is a great advantage in ordinary bufinefs. A nice hydrometer is not only an expenfive inftrument, but exceedingly delicate, being fo very thin. If broken or even bruifed, it is ufelefs, and can hardly be repaired except by the very maker.

As the only queftion here is, to determine how many gallons of excife proof fpirits is contained in a quantity of liquor, the artift has conftructed this feries of bubbles in the fimpleft manner poffible, by previoufly making 40 or 50 mixtures of fpirits and water, and then adjufting the bubbles to thefe mixtures. In fome fets the number on each bubble is the number of gallons of proof fpirits contained in 100 gallons of the liquor. In other fets the number on each bubble expreffes the gallons of water which will make a liquor of this ftrength, if added to 14 gallons of alcohol. Thus, if a liquor anfwers to N° 4, then 4 gallons of water added to 14 gallons of alcohol will make a liquor of this ftrength. The firft is the beft method; for we fhould be miftaken in fuppofing that 18 gallons, which anfwer to N° 4, contains exactly 14 gallons of alcohol: it contains more than 14, for a reafon to be given by and by.

By examining the fpecific gravity of bodies, the philofopher has made fome very curious difcoveries. The moft remarkable of thefe is the change which the denfity of bodies fuffers by mixture. It is a moft reafonable expectation, that when a cubic foot of one fubftance is mixed *any how* with a cubic foot of another, the bulk of the mixture will be two cubic feet; and that 18 gallons of water joined to 18 gallons of oil will fill a veffel of 36 gallons. Accordingly this was never doubted; and even Archimedes, the moft fcrupulous of mathematicians, proceeded on this fuppofition in the folution of his famous problem, the difcovery of the proportion of filver and gold in a mixture of both. He does not even mention it as a poftulate that *may* be granted him, fo much did he conceive it to be an axiom. Yet a little reflection feems fufficient to make it doubtful and to require examination. A box filled with mufket-balls will receive a confiderable quantity of fmall fhot, and after this a confiderable quantity of fine fand, and after this a confiderable quantity of water. Something like this might happen in the admixture of bodies of porous texture. But fuch fubftances as metals, glafs, and fluids, where no difcontinuity of parts can be perceived, or was fufpected, feem free from every chance of this kind of introfufception. Lord Bacon, however, without being a naturalift or mathematician *ex profeffo*, inferred from the mobility of fluids that they confifted of difcrete particles, which muft have pores interpofed, whatever be their figure. And if we afcribe the different denfities, or other fenfible qualities, to difference in fize or figure of thofe particles, it muft frequently happen that the fmaller particles will be lodged in the interftices between the larger, and thus contribute to the weight of the fenfible mafs without increafing its bulk. He therefore fufpects that mixtures will be in general lefs bulky than the fum of their ingredients.

Accordingly, the examination of this queftion was one of the firft employments of the Royal Society of London, and long before its inftitution had occupied the attention of the gentlemen who afterwards compofed it. The regifter of the Society's early meetings contains many experiments on this fubject, with mixtures of gold and filver, of other metals, and of various fluids,

Specific Gravity.

fluids, examined by the hydroftatical balance of Mr Boyle. Dr Hooke made a prodigious number, chiefly on articles of commerce, which were unfortunately loft in the fire of London.

It was foon found, however, that Lord Bacon's conjecture had been well founded, and that bodies changed their denfity very fenfibly in many cafes. In general, it was found that bodies which had a ftrong chemical affinity increafed in denfity, and that their admixture was accompanied with heat.

By this difcovery it is manifeft that Archimedes had not folved the problem of detecting the quantity of filver mixed with the gold in King Hiero's crown, and that the phyfical folution of it requires experiments made on all the kinds of matter that are mixed together. We do not find that this has been done to this day, although we may affirm that there are few queftions of more importance. It is a very curious fact in chemiftry, and it would be moft defirable to be able to reduce it to fome general laws: For inftance, to afcertain what is the proportion of two ingredients which produces the greateft change of denfity. This is important in the fcience of phyfics, becaufe it give us confiderable information as to the mode of action of thofe natural powers or forces by which the particles of tangible matter are united. If this introfufception, concentration, compenetration, or by whatever name it be called, were a mere reception of the particles of one fubftance into the interftices of thofe of another, it is evident that the greateft concentration would be obferved when a fmall quantity of the recipiend is mixed with, or diffeminated through, a great quantity of the other. It is thus that a fmall quantity of fine fand will be received into the interftices of a quantity of fmall fhot, and will increafe the weight of the bagful without increafing its bulk. The cafe is nowife different when a piece of freeftone has grown heavier by imbibing or abforbing a quantity of water. If more than a certain quantity of fand has been added to the fmall fhot, it is no longer concealed. In like manner, various quantities of water may combine with a mafs of clay, and increafe its fize and weight alike. All this is very conceivable, occafioning no difficulty.

But this is not the cafe in any of the mixtures we are now confidering. In all thefe, the firft additions of either of the two fubftances produce but an inconfiderable change of general denfity; and it is in general moft remarkable, whether it be condenfation or rarefaction, when the two ingredients are nearly of equal bulks. We can illuftrate even this difference, by reflecting on the imbibition of water by vegetable folids, fuch as timber. Some kinds of wood have their weight much more increafed than their bulks; other kinds of wood are more enlarged in bulk than in weight. The like happens in grains. This is curious, and fhows in the moft unqueftionable manner that the particles of bodies are not in contact, but are kept together by forces which act at a diftance. For this diftance between the centres of the particles is moft evidently fufceptible of variation; and this variation is occafioned by the introduction of another fubftance, which, by acting on the particles by attraction or repulfion, diminifhes or increafes their mutual actions, and makes new diftances neceffary for bringing all things again into equilibrium. We refer the curious reader to the ingenious theory of the abbé Bofcovich for an excellent illuftration of this fubject (*Theor. Phil. Nat.* § de Solutione Chemica).

This queftion is no lefs important to the man of bufinefs. Till we know the condenfation of thofe metals by mixture, we cannot tell the quantity of alloy in gold and filver by means of their fpecific gravity; nor can we tell the quantity of pure alcohol in any fpirituous liquor, or that of the valuable falt in any folution of it. For want of this knowledge, the dealers in gold and filver are obliged to have recourfe to the tedious and difficult teft of the affay, which cannot be made in all places or by all men. It is therefore much to be wifhed, that fome perfons would inftitute a feries of experiments in the moft interefting cafes: for it muft be obferved, that this change of denfity is not always a fmall matter; it is fometimes very confiderable and paradoxical. A remarkable inftance may be given of it in the mixture of brafs and tin for bells, great guns, optical fpeculums, &c. The fpecific gravity of caft brafs is nearly 8.006, and that of tin is nearly 7.363. If two parts of brafs be mixed with one of tin, the fpecific gravity is 8.917; whereas, if each had retained its former bulk, the fp. grav. would have been only $7.793\left(=\frac{2\times 8.006+7.363}{3}\right)$. A mixture of equal parts fhould have the fpecific gravity 7.684; but it is 8.441. A mixture of two parts tin with one part brafs, inftead of being 7.577, is 8.027.

In all thefe cafes there is a great increafe of fpecific gravity, and confequently a great condenfation of parts or contraction of bulk. The firft mixture of eight cubic inches of brafs, for inftance, with four cubic inches of tin, does not produce 12 cubic inches of bell-metal, but only $10\frac{1}{2}$ nearly, having fhrunk $\frac{1}{8}$. It would appear that the diftances of the brafs particles are moft affected, or perhaps it is the brafs that receives the tin into its pores; for we find that the condenfations in thefe mixtures are nearly proportional to the quantities of the brafs in the mixtures. It is remarkable that this mixture with the lighteft of all metals has made a compofition more heavy and denfe than brafs can be made by any hammering.

The moft remarkable inftance occurs in mixing iron with platina. If 10 cubic inches of iron are mixed with $1\frac{1}{4}$ of platina, the bulk of the compound is only $9\frac{1}{2}$ inches. The iron therefore has not fimply received the platina into its pores: its own particles are brought nearer together. There are fimilar refults in the folution of turbith mineral, and of fome other falts, in water. The water, inftead of rifing in the neck of the veffel, when a fmall quantity of the falt has been added to it, finks confiderably, and the two ingredients occupy lefs room than the water did alone.

The fame thing happens in the mixture of water with other fluids and different fluids with each other: But we are not able to trace any general rule that is obferved with abfolute precifion. In moft cafes of fluids the greateft condenfation happens when the bulks of the ingredients are nearly equal. Thus, in the mixture of alcohol and water, we have the greateft condenfation when $16\frac{1}{2}$ ounces of alcohol are mixed with 20 ounces of water, and the condenfation is about $\frac{1}{50}$ of the whole bulk of the ingredients. It is extremely various in different fubftances, and no claffification of them can be made in this refpect.

A differtation has been publifhed on this fubject by Dr

Specific Gravity.

Dr Hahn of Vienna, intitled *De Efficacia Mixtionis in mutandis Corporum Voluminibus*, in which all the remarkable inſtances of the variation of denſity have been collected. All that we can do (as we have no directing principle) is to record ſuch inſtances as are of chief importance, being articles of commerce.

The firſt that occurs to us is the mixtures of alcohol and water in the compoſition of ſpirituous liquors. This has been conſidered by many with great care. The moſt ſcrupulous examination of this, or perhaps of any mixture, has been lately made by Dr Blagden (now Sir Charles Blagden) of the Royal Society, on the requiſition of the Board of Exciſe. He has publiſhed an account of the examination in the Philoſophical Tranſactions of London in 1791 and 1792. We ſhall give an account of it under the article *SPIRITUOUS Liquors;* and at preſent only ſelect one column, in order to ſhow the condenſation. The alcohol was almoſt the ſtrongeſt that can be produced, and its ſpecific gravity, when of the temperature 60°, was 0.825. The whole mixtures were of the ſame temperature.

Column 1. contains the pounds, ounces, or other meaſures by weight, of alcohol in the mixture. Column 2. contains the pounds or ounces of water. Column 3. is the ſum of the bulks of the ingredients, the bulk of a pound or ounce of water being accounted 1. Column 4. is the obſerved ſpecific gravity of the mixture, taken from Dr Blagden's diſſertation. Column 5. is the ſpecific gravity which would have been obſerved if the ingredients had each retained its own ſpecific gravity. This we calculated by dividing the ſum of the two numbers of the firſt and ſecond columns by the correſponding number of the third. Column 6. is the difference of column 4. and column 5. and exhibits the condenſation.

0	20	20.0000	1.0000	1.0000	

It is to be remarked, that the condenſation is greateſt when $16\frac{1}{2}$ ounces of alcohol have been added to 20 of water, and the condenſation is $\frac{2631}{92835}$, or nearly $\frac{1}{36}$th of the computed denſity. Since the ſpecific gravity of alcohol is 0.825, it is evident that $16\frac{1}{2}$ ounces of alcohol and 20 ounces of water have equal bulks. So that the condenſation is greateſt when the ſubſtances are mixed in equal volumes; and 18 gallons of alcohol mixed with 18 gallons of water will produce not 36 gallons of ſpirits, but 35 only.

We may alſo obſerve, that this is the mixture to which our revenue laws refer, declaring it to be *one to ſix* or *one in ſeven* under proof, and to weigh 7 pounds 13 ounce per gallon. This proportion was probably ſelected as the moſt eaſily compoſed, viz. by mixing equal meaſures of water and of the ſtrongeſt ſpirit which the known proceſſes of diſtillation could produce. Its ſpecific gravity is 0.939 very nearly.

We muſt conſider this elaborate examination of the mixture of water and alcohol as a ſtandard ſeries of experiments, to which appeal may always be made, whether for the purpoſes of ſcience or of trade. The regularity of the progreſſion is ſo great, that in the column which we have examined, viz. that for temperature 60°, the greateſt anomaly does not amount to one part in ſix thouſand. The form of the ſeries is alſo very judiciouſly choſen for the purpoſes of ſcience. It would perhaps have been more directly ſtereometrical had the proportions of the ingredients been ſtated in bulks, which are more immediately connected with denſity. But the author has aſſigned a very cogent reaſon for his choice, viz. that the proportion of bulks varies by a change of temperature, becauſe the water and ſpirits follow different laws in their expanſion by heat.

This is a proper opportunity for taking notice of a miſtake which is very generally made in the concluſions drawn from experiments of this kind. Equal additions of the ſpirit or water produce a ſeries of ſpecific gravities, which decreaſe or increaſe by differences continually diminiſhing. Hence it is inferred that there is a contraction of bulk. Even Dr Lewis, one of our moſt accompliſhed

complished naturalists, advances this position, in a dissertation on the potash of America; and it considerably affects his method for estimating the strength of the potash leys. But that it is a mistake, appears plainly from this, that although we add for ever equal quantities of the spirits, we shall never produce a *mixture* which has as small a specific gravity as alcohol. Therefore the series of successive gravities must approximate to this without end, like the ordinates of a hyperbolic curve referred to its assymptote.

That this may appear in the most general terms, let w represent the weight of the constant quantity of water in the mixture, and let a be the weight of the small addition of spirits. Also let w represent the bulk of this quantity of water, and b the bulk of the small addition of alcohol. The weight of the mixture is $w+a$, and its bulk is $w+b$, and its specific gravity is $\frac{w+a}{w+b}$. If we now add a second equal quantity of spirits, the weight will be $w+2a$, and if the spirit retains its density unchanged, the bulk will be $w+2b$, and the specific gravity is $\frac{w+2a}{w+2b}$: and after any number m of such equal additions of spirits, the specific gravity will be $\frac{w+ma}{w+mb}$. Divide the numerator of this fraction by its denominator, and the quotient or specific gravity will be $1+\frac{m\times\overline{a-b}}{w+mb}$. This consists of the constant part 1, and the variable part $\frac{m(a-b)}{w+mb}$. We need attend only to this part. If its denominator were constant, it is plain that the successive specific gravities would have equal differences, each being $=\frac{a-b}{w+mb}$, because m increases by the continual addition of an unit, and $a-b$ is a constant quantity. But the denominator $w+mb$ continually increases, and therefore the value of the fraction $\frac{a-b}{w+mb}$ continually diminishes.

Therefore the gradual diminution of the increments or decrements of specific gravity, by equal additions of one ingredient to a constant measure of the other, is not of itself an indication of a change of density of either of the ingredients; nor proves that in very diluted mixtures a greater proportion of one ingredient is absorbed or lodged in the interstices of the other, as is generally imagined. This must be ascertained by comparing each specific gravity with the gravity expressed by $1+\frac{w+m(a-b)}{w+mb}$.

This series of specific gravities resembles such a numerical series as the following, 1; . . . . ; 1.56; 1.163; 1.+69; &c. the terms of which also consist of the constant integer 1, and the decimal fractions 0.156; 0.163; 0.169; &c. The fraction $\frac{m(a-b)}{w+mb}$ expresses this decimal part. Call this d, or make $d=\frac{m(a-b)}{w+mb}$. This will give us $b=\frac{ma-wd}{m(1+d)}$. Now a is the weight of the added ingredient, and d is the variable part of the specific gravity observed; and thus we learn whether b, the bulk of the added ingredient, suffers any change. We shall have occasion by and by to resume the consideration of this question, which is of the first moment in the theory of specific gravities, and has great influence in many transactions of commerce.

This series of specific gravities is not so well fitted for commercial transactions. In these the usual question is, how many gallons of alcohol is there in a cask, or some number of gallons of spirit? and it is more directly answered by means of a table, formed by mixing the ingredients in aliquant parts of one constant bulk. The following table, constructed from the experiments of Mr Brisson of the academy of Paris, and published in the Memoirs for 1769, is therefore inserted.

W.	A.	Density observed.	Density computed.	Condensation.	Bulk of 10.000 grains..
0	16	0.8371	0.8371		1.0000
1	15	0.8527	0.8473	63	0.9937
2	14	0.8674	0.8575	115	0.9885
3	13	0.8815	0.8677	157	0.9844
4	12	0.8947	0.8778	189	0.9811
5	11	0.9075	0.8880	214	0.9786
6	10	0.9199	0.8982	235	0.9765
7	9	0.9317	0.9084	251	0.9749
8	8	0.9427	0.9186	256	0.9744
9	7	0.9519	0.9287	243	0.9757
10	6	0.9598	0.9389	217	0.9783
11	5	0.9674	0.9491	189	0.9811
12	4	0.9733	0.9593	144	0.9856
13	3	0.9791	0.9695	99	0.9901
14	2	0.9852	0.9796	57	0,9943
15	1	0.9919	0.9898	21	0.9979
16	0	1.0000	1.0000		1.0000

In this table the whole quantity of spirituous liquor is always the same. The first column is the number of measures (gallons, pints, inches, &c.) of water in the mixture: and column 2d gives the measures of alcohol. Column 3d is the specific gravity which was observed by Mr Brisson. Column 4th is the specific gravity which would have been observed if the spirits, or water, or both, had retained their specific density unchanged. And the 5th column marks the augmentation of specific gravity or density in parts of 10.000. A 6th column is added, showing the bulk of the 16 cubic measures of the two ingredients. Each measure may be conceived as the 16th part of 10.000, or 625; and we may suppose them cubic inches, pints, gallons, or any solid measure.

This table scarcely differs from Sir Charles Blagden's; and the very small difference that may be observed, arises from Mr Brisson's having used an alcohol not so completely rectified. Its specific gravity is 9,8371, whereas the other was only 0,8250.

Here it appears more distinctly that the condensation is greatest when the two ingredients are of equal bulk.

Perhaps this series of specific gravities is as declarative as the other, whether or not there is a change of density induced in either of the ingredients. The whole

whole bulk being always the same, it is plain that the successive equal additions to one of the ingredients is a successive equal abstraction of the other. The change produced, therefore, in the weight of the whole, is the difference between the weight of the ingredient which is taken out and the weight of the equal measure of the other which supplies its place. Therefore, if neither ingredient changes its density by mixture, the weights of the mixtures will be in arithmetical progression. If they are not, there is a variation of density in one or both the ingredients.

We see this very clearly in the mixtures of water and alcohol. The first specific gravity differs from the second by 156, and the last differs from the preceding by no more than 81. Had neither of the densities changed, the common difference would have been 102. We observe also, that the augmentation of specific gravity, by the successive addition of a measure of water, grows less and less till 12 measures of water is mixed with 4 of alcohol, when the augmentation is only 58, and then it increases again to 81.

It also appears, that the addition of one measure of water to a quantity of alcohol produces a greater change of density than the mixture of one measure of alcohol to a quantity of water. Hence some conclude, that the water disappears by being lodged in the interstices of the spirit. But it is more agreeable to the justest notions which we can form of the internal constitution of tangible bodies to suppose that the particles of water diminish the distances between the particles of alcohol by their strong attractions, and that this diminution (exceedingly minute in itself) becomes sensible on account of the great number of particles whose distances are thus diminished. This is merely a probability founded on this, that it would require a much greater diminution of distances if it was the particles of water which had their distances thus diminished. But the greater probability is, that the condensation takes place in both.

We have been so particular in our consideration of this mixture, because the law of variation of density has, in this instance, been ascertained with such precision by the elaborate examination of Sir Charles Blagden, so that it may serve as an example of what happens in almost every mixture of bodies. It merits a still farther discussion, because it is intimately connected with the action of the corpuscular forces; and an exact knowledge of the variations of distance between the particles will go far to ascertain the law of action of these forces. But the limits of a work like this will not permit us to dwell longer on this subject. We proceed therefore to give another useful table.

The vitriolic or sulphuric acid is of extensive use in manufactures under the name of oil of vitriol. Its value depends entirely on the saline ingredient, and the water is merely a vehicle for the acid. This, being much denser than water, affects its specific gravity, and thus gives us a method of ascertaining its strength.

The strongest oil of vitriol that can be easily manufactured contains $612\frac{1}{10}$ grains of dry acid, united with $387\frac{1}{10}$ grains of water, which cannot be separated from it by distillation, making 1000 grains of OIL OF VITRIOL. Its specific gravity in this state is 1.877.

The following table shows its specific gravity at the temperature of 55° when diluted by the successive addition of parts of water by weight.

Ol. Vit.		Water.	Specific Gravity. Observed.	Calculated.	Cond.
10	×	0	1.877	1.877	.00
		4	1.644	1.501	.143
		8	1.474	1.350	.124
		12	1.381	1.269	.112
		16	1.320	1.219	.101
		20	1.274	1.184	.090
		24	1.243	1.159	.084
		28	1.211	1.140	.071
		32	1.195	1.125	.070
		36	1.183	1.113	.070
		40	1.172	1.103	.070
		50	1.148	1.084	.064
		60	1.128	1.069	.059

Here is observed a much greater condensation than in the mixture of alcohol and water. But we cannot assign the proportion of ingredients which produces the greatest condensation; because we cannot, in any case, say what is the proportion of the saline and watery ingredients. The strongest oil of vitriol is already a watery solution; and it is by a considerable and uncertain detour that Mr Kirwan has assigned the proportion of 612 and 388 nearly. If this be the true ratio, it is unlike every other solution that we are acquainted with; for in all solutions of salts, the salt occupies less room in its liquid form than it did when solid; and here it would be greatly the reverse.

This solution is remarkable also for the copious emergence of heat in its dilutions with more water. This has been ascribed to the great superiority of water in its capacity for heat; but there are facts which render this very doubtful. A vessel of water, and another of oil of vitriol, being brought from a cold room into a warm one, they both imbibe heat, and rise in their temperature; and the water employs nearly the same time to attain the temperature of the room.

Aquafortis or nitrous acid is another fluid very much employed in commerce; so that it is of importance to ascertain the relation between its saline strength and its specific gravity. We owe also to Mr Kirwan a table for this purpose.

The most concentrated state into which it can easily be brought is such, that 1000 grains of it consists of 563 grains of water and 437 of dry acid. In this state its specific gravity is 1.557. Let this be called *nitrous acid*.

Nitr. Ac.		Water.			
10	×	0	1.557	1.557	
		1	1.474	1.474	
		6	1.350	1.273	0.077
		11	1.269	1.191	0.078
		16	1.214	1.147	0.067
		21	1.175	1.120	0.055
		26	1.151	1.101	0.050
		31	1.127	1.087	0.040
		36	1.106	1.077	0.029
		41	1.086	1.068	0.018

There is not the same uniformity in the densities of this acid in its different states of dilution. This seems owing

owing to the variable proportion of the deleterious and vital air which compose this acid. It is more dense in proportion as it contains more of the latter ingredient.

The proportions of the aeriform ingredients of the muriatic acid are so very variable, and so little under our command, that we cannot frame tables of its specific gravity which would enable us to judge of its strength.

It is a general property of these acids, that they are more expansible by heat as they are more concentrated.

There is another class of fluids which it would be of great consequence to reduce to some rules with respect to specific gravity, namely, the solutions of salts, gums, and resins. It is interesting to the philosopher to know in what manner salts are contained in these watery solutions, and to discover the relation between their strength and density; and to the man of business it would be a most desirable thing to have a criterion of the quantity of salt in any brine, or of extractable matter in a decoction. It would be equally desirable to those who are to purchase them as to those who manufacture or employ them. Perhaps we might ascertain in this way the value of sugar, depending on the quantity of sweetening matter which it contains; a thing which at present rests on the vague determination of the eye or palate. It would therefore be doing a great service to the public, if some intelligent person would undertake a train of experiments with this view. Accuracy alone is required; and it may be left to the philosophers to compare the facts, and draw the consequences respecting the internal arrangement of the particles.

One circumstance in the solution of salts is very general; and we are inclined, for serious reasons, to think it universal: this is a diminution of bulk. This indeed in some salts is inconsiderable. Sedative salt, for instance, hardly shows any diminution, and might be considered as an exception, were it not the single instance. This circumstance, and some considerations connected with our notions of this kind of solution, dispose us to think that this salt differs in contraction from others only in degree, and that there is some, though it was not sensible, in the experiments hitherto made.

These experiments, indeed, have not been numerous. Those of Mr Achard of Berlin, and of Dr Richard Watson of Cambridge, are perhaps the only ones of which we have a descriptive narration, by which we can judge of the validity of the inferences drawn from them. The subject is not susceptible of much accuracy; for salts in their solid form are seldom free from cavities and shivery interstices, which do not admit the water on their first immersion, and thereby appear of greater bulk when we attempt to measure their specific gravity by weighing them in fluids which do not dissolve them, such as spirits of turpentine. They also attach to themselves, with considerable tenacity, a quantity of atmospheric air, which merely adheres, but makes no part of their composition. This escapes in the act of solution, being set at liberty by the stronger affinity of the water. Sal gem, however, and a few others, may be very accurately measured; and in these instances the degree of contraction is very constant.

The following experiments of Dr Watson appear to us the most instructive as to this circumstance. A glass vessel was used, having a slender cylindrical neck, and holding 67 ounces of pure water when filled to a certain mark. The neck above this mark had a scale of equal parts pasted on it. It was filled to the mark with water. Twenty-four pennyweights of salt were thrown into it as speedily as possible, and the bulk of the salt was measured by the elevation of the water. Every thing was attended to which could retard the immediate solution, that the error arising from the solution of the first particles, before the rest could be put in, might be as small as possible; and in order that both the absolute bulk and its variations might be obtained by some known scale, 24 pennyweights of water were put in. This raised the surface 58 parts of the scale. Now we know exactly the bulk of 24 pennyweights of pure water. It is 2.275 cubic inches; and thus we obtain every thing in absolute measures: And by comparing the bulk of each salt, both at its first immersion and after its complete solution, we obtain its specific gravity, and the change made on it in passing from a solid to a fluid form. The following table is an abstract of these experiments. The first column of numbers is the elevation of the surface immediately after immersion; the second gives the elevation when the salt is completely dissolved; and the third and fourth columns are the specific gravities of the salts in these two states.

Twenty-four Pennyweights.	I.	II	III.	IV.
Water -	58			
Glauber's salt -	42	36	1.380	1.611

Corrosive sublimate -	14	10	4.142	3.800
Turbith mineral -	9	0	6.444	

The inspection of this list naturally suggests two states of the case as particularly interesting to the philosopher studying the theory of solution. The first state is when the lixivium approaches to saturation. In the very point of saturation any addition of salt retains its bulk unchanged. In diluted brines, we shall see that the density

sity

Specific Gravity.

fity of the fluid falt is greater, and gradually diminifhes as we add more falt. It is an important queftion, Whether this diminution goes on continually, till the fluid denfity of the falt is the fame with its folid denfity? or, Whether there is an abrupt paffage from fome degree of the one to the fixed degree of the other, as we obferve in the freezing of iron, the fetting of ftucco, and fome other inftances?

The other interefting ftate is that of extreme dilution, when the differences between the fucceffive denfities bear a great proportion to the denfities themfelves, and thus enable the mathematician to afcertain with fome precifion the variations of corpufcular force, in confequence of a variation of diftance between the particles. The fketch of an inveftigation of this important queftion given by Bofcovich, in his Theory of Natural Philofophy, is very promifing, and fhould incite the philofophical chemift to the ftudy. The firft thing to be done is to compare the law of fpecific gravity; that is, the relation between the fpecific gravity and quantity of falt held in folution.

Wifhing to make this work as ufeful as poffible, we have fearched for experiments, and trains of experiments, on the denfity of the many brines which make important articles of commerce; but we were mortified by the fcantinefs of the information, and difappointed in our hopes of being able to combine the detached obfervations, fuited to the immediate views of their authors, in fuch a manner as to deduce from them fcales (as they may be called) of their ftrength. We rarely found thefe detached obfervations attended with circumftances which would connect them with others; and there was frequently fuch a difcrepancy, nay oppofition, in feriefes of experiments made for afcertaining the relation between the denfity and the ftrength, that we could not obtain general principles which enable us to conftruct tables of ftrength *à priori*.

Mr Lambert, one of the firft mathematicians and philofophers of Europe, in a differtation in the Berlin Memoirs (1762), gives a narration of experiments on the brines of common falt, from which he deduces a very great condenfation, which he attributes to an abforption in the weak brines of the falt, or a lodgement of its particles in the interftices of the particles of water. Mr Achard of the fame academy, in 1785, gives a very great lift of experiments on the bulks of various brines, made in a different way, which fhow no fuch introfufception; and Dr Watfon thinks this confirmed by experiments which he narrates in his Chemical Effays. We fee great reafon for hefitating our affent to either fide, and do not think the experiments decifive. We incline to Mr Lambert's opinion; for this reafon, that in the fucceffive dilutions of oil of vitriol and aquafortis there is a moft evident and remarkable condenfation. Now what are thefe but brines, of which we have not been able to get the faline ingredient in a feparate form? The experiments of Mr Achard and Dr Watfon were made in fuch a way that a fingle grain in the meafurement bore too great a proportion to the whole change of fpecific gravity. At the fame time, fome of Dr Watfon's are fo fimple in their nature that it is very difficult to with-hold the affent.

In this ftate of uncertainty, in a fubject which feems to us to be of public importance, we thought it our duty to undertake a train of experiments to which recourfe may always be had. Works like this are feldom confidered as fources of original information; and it is thought fufficient when the knowledge already diffufed is judicioufly compiled. But a due refpect for the public, and gratitude for the very honourable reception hitherto given to our labours, induce us to exert ourfelves with honeft zeal to merit the continuance of public favour. We affure our readers that the experiments were made with care, and on quantities fufficiently large to make the unavoidable irregularities in fuch cafes quite infignificant. The law of denfity was afcertained in each fubftance in two ways. We diffolved different portions of falt in the fame quantity of water, and examined the fpecific gravity of the brine by weighing it in a veffel with a narrow neck. The portions of falt were each of them one eighth of what would make a nearly faturated folution of the temperature 55. We did not make the brine ftronger, that there might be no rifk of a precipitation in form of cryftals. We confidered the fpecific gravities as the ordinates of a curve, of which the abfciffæ were the numbers of ounces of dry falt contained in a cubic foot of the brine. Having thus obtained eight ordinates correfponding to 1, 2, 3, 4, 5, 6, 7, and 8 portions of falt, the ordinates or fpecific gravities for every other proportion of falt were had by the ufual methods of interpofition.

The other method was, by firft making a brine nearly faturated, in which the proportion of falt and water was exactly determined. We then took out one-eighth of the brine, and filled up the veffel with water, taking care that the mixture fhould be complete; for which purpofe, befides agitation, the diluted brine was allowed to remain 24 hours before weighing. Taking out one-eighth of the brine alfo takes out one eighth of the falt; fo that the proportion of falt and water in the diluted brine was known. It was now weighed, and thus we determined the fpecific gravity for a new proportion of falt and water.

We then took out one-feventh of the brine. It is evident that this takes out one-eighth of the original quantity of falt; an abftraction equal to the former. We filled the veffel with water with the fame precautions; and in the fame manner we proceeded till there remained only one-eighth of the original quantity of falt.

The fpecific gravities by thefe two methods agreed extremely well. In the very deliquefcent falts the firft method exhibited fome fmall irregularities, arifing from the unequal quantities of water which they had imbibed from the atmofphere. We therefore confided moft in the experiments made with diluted brines.

That the reader may judge of the authority of the tables which we fhall infert, we fubmit to his infpection one feries of experiments.

Two thoufand one hundred and eighty-eight grains of very pure and dry (but not decrepitated) common falt, prepared in large cryftals, were diffolved in 6562 grains of diftilled water of the temperature 55°. A fmall matrafs with a narrow neck, which held 4200 grains of diftilled water, was filled with this brine. Its contents weighed 5027 grains. Now $6562 + 2188 : 2188 = 5027 : 1256.75$. Therefore the bottle of brine contained 1256.75 grains of falt diffolved in 3770.25 grains of water. Its fpecific gravity is $= \frac{5027}{4200}$, or 1.196905: and a cubic foot of brine weighs 11969

Specific Gravity.

1196.9 ounces avoirdupois. Alſo 5027 : 1256.75 = 1196.9 : 299.28. Therefore a cubic foot of this brine contains 299.28 ounces of perfectly dry ſalt.

The ſubſequent ſteps of the proceſs are repreſented as follows.

Salt.	Brine.	Water.	Wt. of Cub Ft.	Salt in Cub. Ft.
8)1256.75 157.1	8)5027 628.4	3770.25 $=\frac{1}{8}$ of brine.	1196.9	299.28 37.41 $\frac{1}{8}$
	4398.6 527.4	Remains. Water to fill it again.		
7)1099.6 157.1	7)4926.0 703.7	2d Brine. $\frac{1}{7}$ taken out.	1172.7	261.87 37.41
	4222.3 604.7	Water added.		
942.5 157.1	6)4827.0 804.5	3d Brine. Taken out.	1149.3	224.46
	4022.5 706.5	Remains. Water added.		
785.4 157.1	5)4729.0 946	4th Brine. Taken out.	1125.9	187.05
	3783 847	Remains. Water added.		
628.3 157.1	4)4630 1157.5	5th Brine. Taken out.	1102.3	149.64
	3472.5 1054.5	Remains. Water added.		
471.2 157.1	3)4527 1509	6th Brine. Taken out.	1077.9	112.23
	3018 1405	Remains. Water added.		
314.1 157.1	2)4423 2212	7th Brine. Taken out.	1053.3	74.82
	2211 2102	Remains. Water added.		
157.0	4313	8th Brine.	1027.9	37.41

Thus, by repeated abſtraction of brine, ſo as always to take out $\frac{1}{8}$th of the ſalt contained in one conſtant bulk, we have obtained a brine conſiſting of 157 grains of ſalt united with 4313—157, or 4156 grains of water. Its ſpecific gravity is $\frac{4313}{4200}$, = 1,0279, and a cubic foot of it weighs 1028 ounces, and contains $37\frac{4}{10}$ ounces of dry ſalt. In like manner may the ſpecific gravity, the weight of a cubic foot, and the ſalt it contains, be eſtimated for the intermediate brines.

When theſe eight quantities of ſalt contained in a cubic foot are made the abſciſſæ, and the weights of the cubic foot of brine are the correſponding ordinates, the curve will be found to be extremely regular, reſembling a hyperbolic arch whoſe aſſymptote makes an angle of 30° with the axis. Ordinates were then interpolated analytically for every 10 ounces of contained ſalt, and thus the table was conſtructed. We did not, however, reſt it on one ſeries alone; but made others, in which one-fourth of the ſalt was repeatedly abſtracted. They agreed, in the caſe of common ſalt, with great exactneſs, and in ſome others there were ſome very inconſiderable irregularities.

To ſhow the authority of the tables of ſtrength was by no means our only motive for giving an example of the proceſs. It may be of uſe as a pattern for ſimilar experiments. But, beſides, it is very inſtructive. We ſee, in the firſt place, that there is a very ſenſible change of denſity in one or both of the ingredients. For the ſeries is of that nature (as we have formerly explained), that if the ingredients retained their denſities in every proportion of commixture, the ſpecific gravities would have been in arithmetical progreſſion; whereas we ſee that their differences continually diminiſh as the brines grow more denſe. We can form ſome notion of this by comparing the different brines. Thus in the firſt brine, weighing 5027 grains, there are 3770 grains of water in a veſſel holding 4200. If the denſity of the water remains the ſame, there is left for the ſalt only as much ſpace as would hold 430 grains of water. In this ſpace are lodged 1257 grains of ſalt, and its ſpecific gravity, in its liquid form, is $\frac{1257}{430}$, = 2.8907 very nearly. But in the 8th brine the quantity of water is 4156, the ſpace left for 157 grains of ſalt is only the bulk of 44 grains of water, and the denſity of the ſalt is $\frac{157}{44} = 3.568$, conſiderably greater than before. This induced us to continue the dilution of the brine as follows, beginning with the 8th brine.

157 78.5	2)4313 2156.5	8th brine
	2156.5 2105.5	
78.5 39.7	2)4262.0 2131	9th brine
	2102	
39.7	2)4233 2116.5	10th brine
	2116.5 2102	
19.8	4218	11th brine.

This laſt brine contains 4198.2 grains of water, leaving only the bulk of 1.8 grains of water to contain 19.8 of ſalt, ſo that the ſalt is ten times denſer than water. This will make the ſtrength 243 inſtead of 210 indicated by the ſpecific gravity. But we do not pretend to meaſure the denſities with accuracy in theſe diluted brines. It is evident from the proceſs that a ſingle

ſingle grain of exceſs or defect in taking out the brine and replacing it with water has a ſenſible proportion to the whole variation. But we ſee with ſufficient evidence, that from the ſtrong to the weak brines the ſpace left for the portion of ſalt is continually diminiſhing. In the firſt dilution 527½ grains of water were added to fill up the veſſel; but one-eighth of its contents of pure water is only 525: ſo that here is a diminution of two grains and a half in the ſpace occupied by the remaining ſalt. The ſubſequent additions are 604.7; 706.5; 847; 1054.5; 1405; 2102; 2105.5; 2102; 2102; inſtead of 600; 700; 840; 1050; 1400; 2100; 2100; 2100; 2100. Nothing can more plainly ſhow the condenſation in general, though we do not learn whether it happens in one or both of the ingredients; nor do the experiments ſhow with ſufficient accuracy the progreſſion of this diminution. The exceſſes of the added water being only ſix or ſeven grains, we cannot expect a nice repartition. When the brine is taken out, the upper part of the veſſel remains lined with a briny film containing a portion of ſalt and water, perhaps equal or ſuperior to the differences. Had our time permitted, we ſhould have examined this matter with ſcrupulous attention, uſing a veſſel with a ſtill narrower neck, and in each dilution abſtracting one half of the brine. The curve, whoſe abſciſſæ and ordinates repreſent the weight of the contained ſalt and the weight of a conſtant bulk of the brine, exhibits the beſt and moſt ſynoptical view of the law of condenſation, becauſe the poſition of the tangent in any point, or the value of the ſymbol $\frac{\dot{x}}{\dot{y}}$, always ſhows the rate at which the ſpecific gravity increaſes or diminiſhes. We are inclined to think that the curve in all caſes is of the hyperbolic kind, and complete; that is, having the tangent perpendicular to the axis at the beginning of the curve. The mathematical reader will eaſily gueſs the phyſical notions which incline us to this opinion; and will alſo ſee that it is hardly poſſible to diſcover this experimentally, becauſe the miſtake of a ſingle grain in the very ſmall ordinates will change the poſition of the tangent many degrees. It was for this reaſon that we thought it uſeleſs to proſecute the dilution any farther. But we think that it may be proſecuted much farther in Dr Watſon's or Mr Achard's method, viz. by diſſolving equal weights of ſalt in two veſſels, of very different capacities, having tubular necks, in which the change of bulk may be very accurately obſerved. We can only conclude, that the condenſation is greateſt in the ſtrongeſt brines, and probably attains its maximum when the quantities of true ſaline matter and water are nearly equal, as in the caſe of vitriolic acid, &c.

We conſider theſe experiments as abundantly ſufficient for deciding the queſtion "Whether the ſalt can be received into the pores of the water, or the water into the pores of the ſalt, ſo as to increaſe its weight without increaſing its bulk? and we muſt grant that it may. We do not mean that it is ſimply lodged in the pores as ſand is lodged in the interſtices of ſmall ſhot; but the two together occupy leſs room than when ſeparate. The experiments of Mr Achard were inſufficient for a deciſion, becauſe made on ſo ſmall a quantity as 600 grains of water. Dr Watſon's experiments have, for the moſt part, the ſame defect. Some of them, however, are of great value in this queſtion, and are very fit for aſcertaining the ſpecific gravity of diſſolved ſalts. In one of them (not particularly narrated) he found that a quantity of diſſolved ſalt occupied the ſame bulk in two very different ſtates of dilution. We cannot pretend to reconcile this with our experiments. We have given theſe as they ſtood; and we think them concluſive, becauſe they were ſo numerous and ſo perfectly conſiſtent with each other; and their reſult is ſo general, that we have not found an exception. Common ſalt is by no means the moſt remarkable inſtance of condenſation. Vegetable alkali, ſal ammoniac, and ſome others, exhibit much condenſation.

We thought this a proper opportunity of conſidering this queſtion, which is intimately connected with the principles of chemical ſolution, and was not perhaps conſidered in ſufficient detail under the article CHEMISTRY. We learn from it in general, that the quantities of ſalt in brines increaſe at ſomewhat a greater rate than their ſpecific gravities. This difference is in many caſes of ſenſible importance in a commercial view. Thus an alkaline lixivium for the purpoſes of bleaching or ſoap-making, whoſe ſpecific gravity is 1.234, or exceeds that of water by 234, contains 361 ounces of ſalt in a cubic foot; a ley, which exceeds the weight of water twice as much, or 468 ounces per cubic foot, contains 777 ounces of ſalt, which exceeds the double of 361 by 55 ounces more that ſeven per cent. Hence we learn, that hydrometers for diſcovering the ſtrength of brines, having equal diviſions on a cylindrical ſtem, are very erroneous; for even if the increments of ſpecific gravity were proportional to the quantities of ſalt in a gallon of brine, the diviſions at the bottom of the ſtem ought to be ſmaller than thoſe above.

The conſtruction of the following table of ſtrengths from the above narrated ſeries of brines is ſufficiently obvious. Column 1ſt is the ſpecific gravity as diſcovered by the balance or hydrometer, and alſo is the number of ounces in a cubic foot of the brine. Col. 2d is the ounces of the dry ſalt contained in it.

TABLE of Brines of Common Salt.

Weight Cub Ft. Brine.	Salt in Cub.Ft.	Weight Cub. Ft. Brine.	Salt in Cub.Ft.
1.000	0	1.115	170
1.008	10	1.122	180
1.015	20	1.128	190
1.022	30	1.134	200
1.029	40	1.140	210
1.036	50	1.147	220
1.043	60	1.153	230
1.050	70	1.159	240
1.057	80	1.165	250
1.064	90	1.172	260
1.070	100	1.178	270
1.077	110	1.184	280
1.083	120	1.190	290
1.090	130	1.197	300
1.096	140	1.203	310
1.103	150	1.206	316
1.109	160	1.208	320

The table differs confiderably from Mr Lambert's. The quantities of falt correfponding to any fpecific gravity are about $\frac{1}{15}$th lefs than in his table. But the reader will fee that they correfpond with the feries of experiments above narrated; and thefe were but a few of many which all correfponded within an hundredth part. The caufe of the difference feems to be, that moft kinds of common falt contain magnefian falts, which contain a very great proportion of water neceffary for their cryftallization. The falt which we ufed was of the pureft kind, but fuch as may be had from every falt work, by Lord Dundonald's very eafy procefs, viz. by paffing through it a faturated folution boiling hot, which carries off with it about four-fifths of all the bitter falts. Our aim being to afcertain the quantities of pure fea-falt, and to learn by the bye its relation to water in refpect of denfity, we thought it neceffary to ufe the pureft falt. We alfo dried it for feveral days in a ftove, fo that it contained no water not abfolutely neceffary for its cryftallization. An ounce of fuch falt will communicate a greater fpecific gravity to water than an ounce of a falt that is lefs pure, or that contains extraneous water.

The fpecific gravity 1.090 is that of ordinary pickles, which are eftimated as to ftrength by floating an egg.

We cannot raife the fpecific gravity higher than 1.206 by fimply diffolving falt in cold water. But it will become much denfer, and will even attain the fpecific gravity 1.240 by boiling, then holding about 366 ounces in the cubic foot of hot brine. But it will depofit by cooling, and when of the temperature 55° or 60°, hardly exceeds 1,206. We obtained a brine by boiling till the falt grained very rapidly. When it cooled to 60°, its fpecific gravity was 1.2063; for a veffel which held 3506 grains of diftilled water held 4229 of this brine. This was evaporated to drynefs, and there were obtained 1344 grains of falt. By this was computed the number interpofed between 310 and 320 in the table. We have, however, raifed the fpecific gravity to 1.217, by putting in no more falt than was neceffary for this denfity, and ufing heat. It then cooled down to 60° without quitting any falt; but if a few grains of falt be thrown into this brine, it will quickly depofit a great de l more, and its denfity will decreafe to 1.206. We find this to hold in all falts; and it is a very inftructive fact in the theory of cryftallization; it refembles the effect which a magnet produces upon iron filings in its neighbourhood. It makes them temporary magnets, and caufes them to arrange themfelves as if they had been really made permanent magnets. Juft fo a cryftal already formed difpofes the reft to cryftallize. We imagine that this analogy is complete, and that the forces are fimilar in both cafes.

The above table is computed for the temoerature 55°; but in other temperatures the ftrength will be different on two accounts, viz. the expanfion of the brine and the diffolving power of the water. Water expands about 40 parts in 1000 when heated from 60° to 212°. Saturated brine expands about 48 parts, or one-fifth more than water; and this excefs of expanfion is nearly proportional to the quantity of falt in the brine. If therefore any circumftance fhould oblige us to examine a brine in a temperature much above 60°, allowance fhould be made for this. Thus, fhould the fpecific gravity of brine of the temperature 130 (which is nearly half way between 60 and 212) be 1.140, we muft increafe it by 20 (half of 40); and having found the ftrength 240 correfponding to this corrected fpecific gravity, we muft correct it again by adding 1 to the fpecific gravity for every 45 ounces of falt.

But a much greater and more uncertain correction is neceffary on account of the variation of the diffolving power of water by heat. This indeed is very fmall in the cafe of fea-falt in comparifon with other falts. We prefume that our readers are apprifed of this peculiarity of fea-falt, that it diffolves nearly in equal quantities in hot or in cold water. But although water of the temperature 60 will not diffolve more than 320 or 325 ounces of the pureft and dryeft fea-falt, it will take up above 20 ounces more by boiling on it. When thus faturated to the utmoft, and allowed to cool, it does not quit any of it till it is far cooled, viz. near to 60°. It then depofits this redundant falt, and holds the reft till it is juft going to freeze, when it lets it go in the inftant of freezing. If evaporated in the ftate in which it continues to hold the falt, it will yield above 400 ounces per cubic foot of brine, in good cryftals, but rather overcharged with water. And fince in this ftate the cubic foot of brine weighs about 1220 ounces, it follows, that 820 ounces of water will, by boiling, diffolve 400 of cryftallized falt.

The table fhows how much any brine muft be boiled down in order to grain. Having obferved its fpecific gravity, find in the table the quantity of falt correfponding. Call this x. Then, fince a boiling hot graining or faturated folution contains 340 ounces in the cubic foot of brine, fay $340 : 1000 = x : \frac{1000}{340}x$. This is the bulk to which every cubic foot (valued at 1000) muft be boiled down. Thus fuppofe the brine has the fpecific gravity 1109. It holds 160 ounces per foot, and we muft boil it down to $\frac{1000 \times 160}{340}$ or 471; that is, we muft boil off $\frac{529}{1000}$ of every cubit foot or gallon.

Thefe remarks are of importance in the manufacture of common falt; they enable us to appretiate the value of falt fprings, and to know how far it may be prudent to engage in the manufacture. For the doctrine of latent heat affures us, that in order to boil off a certain quantity of water, a certain quantity of heat is indifpenfably neceffary. After the moft judicious application of this heat, the confumption of fuel may be too expenfive.

The fpecific gravity of fea-water in thefe climates does not exceed 1.03, or the cubic foot weighs 1030 ounces, and it contains about 41 ounces of falt. The brine-pits in England are vaftly richer; but in many parts of the world brines are boiled for falt which do not contain above 10 or 20 ounces in the cubic foot.

In buying falt by weight, it is of importance to know the degree of humidity. A falt will appear pretty dry (if free from magnefian falts) though moiftened with one per cent. of water; and it is found that incipient humidity expofes it much to farther deliquefcence. A much fmaller degree of humidity may be difcovered by the fpecific gravity of a brine made with a few ounces of the falt. And the infpection of the table informs us, that

that the brine should be weak; for the differences of specific gravity go on diminishing in the stronger brines: 300 ounces of dry salt dissolved in 897 ounces of water should give the specific gravity 1197. Suppose it be but 1190, the quantity of salt corresponding is only 290; but when mixed with 897 ounces of water, the weight is 1197, although the weight of the cubic foot is only 1190. There is therefore more than a cubic foot of the brine, and there is as much salt as will make more than a cubic foot of the weight 1190. There is $290 \times \frac{1197}{1190}$, or $291\frac{2}{3}$ ounces, and there is $8\frac{1}{3}$ ounces of water attached to the salt.

The various informations which we have pointed out as deducible from a knowledge of the specific gravity of the brines of common salt, will serve to suggest several advantages of the knowledge of this circumstance in other lixivia. We shall not therefore resume them, but simply give another table or two of such as are most interesting. Of those, alkaline leys are the chief, being of extensive use in bleaching, soap-making, glass-making, &c.

We therefore made a very strong ley of the purest vegetable alkali that is ever used in the manufactories, not thinking it necessary, or even proper, to take it in its state of utmost purity, as obtained from cubic nitre and the like. We took salt of tartar from the apothecary, perfectly dry, of which 3983 grains were dissolved in 3540 grains of distilled water; and after agitation for several days, and then standing to deposit sediment, the clear ley was decanted. It was again agitated; because, when of this strength, it becomes, in a very short time, rarer above and denser at the bottom. A flask containing 4200 grains of water held 6165 of this ley when of the temperature 55°. Its specific gravity was therefore 1.4678, and the 6165 grains of ley contained 3264 grains of salt. We examined its specific gravity in different states of dilution, till we came to a brine containing 51 grains of salt, and 4189 grains of water, and the contents of the flask weighed 4240 grains: its specific gravity was therefore 1.0095. In this train of experiments the progression was most regular and satisfactory; so that when we constructed the curve of specific gravities geometrically, none of the points deviated from a most regular curve. It was considerably more incurvated near its commencement than the curve for sea-salt, indicating a much greater condensation in the diluted brines. We think that the following table, constructed in the same manner as that for common salt, may be depended on as very exact.

Weight of Cub. Foot. oz.	Salt cont. oz.	Weight of Cub. Foot oz.	Salt cont. oz.	Weight of Cub. Foot oz.	Salt cont. oz.	Weight of Cub. Foot oz.	Salt cont. oz.
1000	0	1174	260	1329	520	1471	780
1016	20	1187	280	1340	540	1482	800
1031	40	1200	300	1351	560	1493	820
1045	60	1212	320	1362	580	1504	840
1085	80	1224	340	1372	600	1515	860
1071	100	1236	360	1384	620	1526	880
1084	120	1248	380	1395	640	1537	900
1098	140	1259	400	1406	660	1547	920
1112	160	1270	420	1417	680	1557	940
1125	180	1281	440	1428	700	1567	960
1138	200	1293	460	1438	720	1577	980
1150	220	1305	480	1449	740	1586	1000
1162	240	1317	500	1460	760		

We see the same augmentation of the density of the salt in the diluted brines here as in the case of common salt. Thus a brine, of which the cubit foot weighs 1482 ounces, or which has the specific gravity 1.482, contains 800 ounces of dry alkali and 682 of water. Therefore, if we suppose the density of the water unchanged, there remains the bulk of 318 ounces of water to receive 840 ounces of salt: its density is therefore $\frac{800}{318}$, $= 2.512$ nearly. But in the brine whose weight per foot is only 1016 there are 20 ounces of salt, and therefore 996 of water; and there is only four ounce-measures of water, that is, the bulk of four ounces of water, to receive 20 ounces of salt. Its specific gravity therefore is $\frac{20}{4}, = 5$, almost twice as great as in the strong brine. Accordingly Mr Achard is disposed to admit the absorption (as it is carelessly termed) in the case of sal tart. But it is a general (we think an universal) fact in the solution of salts. It must be carefully distinguished from the first contraction of bulk which salts undergo in passing from a solid to a fluid form. The contraction now under consideration is analogous to the contraction of oil of vitriol when diluted with water; for oil of vitriol must be considered as a very strong brine which we cannot dephlegmate by distillation, and therefore cannot obtain the dry saline ingredient in a separate form, so as to observe its solid density, and say how much it contracts in first becoming fluid. The way of conceiving the first contraction in the act of solution as a lodging of the particles of the one ingredient on the interstices of theo ther, "*qu' ils se nichent, en augmentant le poids sans affecter le volume de la saumure*," as Euler and Lambert express themselves, is impossible here, when both are fluids. Indeed it is but a slovenly way of

thi Lin

Specific Gravity.

thinking in either cafe, and fhould be avoided, becaufe inadvertent perfons are apt to ufe as a phyfical principle what is merely a mode of fpeech.

We learn from the table, that a hydrometer with equi-diftant divifions on a cylindrical or prifmatical ftem is ftill more erroneous than in the brines of common falt.

We learn from the experiments of Kirwan, Lavoifier, and others, that dry falt of tartar contains about one-fourth of its weight of fixed air. In many applications of this falt to the purpofes of manufacture, this ingredient is of no ufe. In fome it is hurtful, and muft be abftracted by lime. Soap-maker's ley confifts of the pure alkaline falt diffolved in water. It is therefore of importance to afcertain its quantity by means of the fpecific gravity of the brine. For this purpofe we took a ley of fal tart. whofe fpecific gravity was 1.20417, containing 314 ounces of mild alkali in a cubic foot of ley, and we rendered it nearly cauftic by lime. The fpecific gravity was then 1.1897. This is a very unexpected refult. Nothing is employed with more fuccefs than quicklime for dephlegmating any watery fluid. We fhould rather have expected an increafe of fpecific gravity by the abftraction of fome of the water of the menftruum, and perhaps the water of the cryftallization, and the aerial part of the falt. But we muft afcribe this to the great denfity in which the fixed air exifts in the mild alkali.

It is unneceffary to give fimilar tables for all the falts, unlefs we were writing a differtation on the theory of their folution. We fhall only obferve, that we examined with particular attention fal ammoniac, becaufe Mr Achard, who denies what is called the abforption of falts, finds himfelf obliged to allow fomething like it in this falt. It does not, however, differ from thofe of which we have given an account in detail in any other refpect than this, that the changes of fluid denfity are much lefs than in others (inftead of being greater, as Achard's experiments feem to indicate) in all brines of moderate ftrength. But in the very weak brines there is indeed a remarkable difference; and if we have not committed an error in our examination, the addition of one part of fal ammoniac to 64 of water occupies lefs room than the water alone. We think that we have met with this as an accidental remark by fome author, whofe work we do not recollect. But we do not choofe to reft fo much on our form of the experiment in fuch weak brines. The following mixtures will abundantly ferve for conftructing the table of its ftrength: Sal ammoniac $=960$ grains was diffolved in 3506 grains of water, making a brine of 4466 grains. A phial which held 1600 grains water held 1698 of this brine. It contained $\frac{1698 \times 960}{4466}$, or 365 grains of falt. The fpecific gravity was $\frac{1698}{1600}, = 1.061$, and the cubic foot weighed 1061 ounces. It alfo contained $\frac{1061 \times 365}{1698}$, or 288 ounces of falt. By repeated abftraction of brine, and replacing with water, we had the following feries:

Specific Gravity, Spectacles.

Series.		Brine.	Sp. Gr.	Oz. Salt in Cub. Ft.
Weight of brine,		1*ft*, 1698	1.061	228
After taking out	$\frac{1}{4}$,	2*d*, 1676	1.048	171
After taking out	$\frac{1}{3}$,	3*d*, 1653	1.033	114
After taking out	$\frac{1}{2}$,	4*th*, 1630	1.019	57
After taking out	$\frac{1}{2}$,	5*th*, 1616	1.010	$28\frac{1}{2}$
	$\frac{1}{2}$,	6*th*, 1610	1.0063	$14\frac{1}{4}$
	$\frac{1}{2}$,	7*th*, 1605	1.0038	$7\frac{1}{8}$

This feries is extremely regular, and the progrefs of denfity may be confidently deduced from it.

From the whole of this difquifition on the relation between the fpecific gravities of brines and the quantities of falt contained, we fee in general that it may be gueffed at, with a ufeful degree of precifion, from the denfity or fpecific gravity of faturated folutions. We therefore conclude with a lift of the fpecific gravities of feveral faturated folutions, made with great care by the bifhop of Landaff.—The temperature was 42°. The firft numerical column is the denfity of faturated brine, and the next is the denfity of a brine confifting of 12 parts (by weight) of water and one of falt. From this may be inferred the quantity in the faturated folution, and from this again may be inferred the quantity correfponding to inferior denfities.

SPECTACLES, in *Dioptrics*, a machine confifting of two lenfes fet in filver, horn, &c. to affift the defects of the organ of fight. Old people, and others who have flat eyes, ufe convex fpectacles, which caufe the rays of light to converge fo as to meet upon the retina: whereas myopes, or fhort-fighted people, ufe concave lenfes for fpectacles, which caufe the rays to diverge, and prevent their meeting ere they reach the retina. See Optics.

Some cafes of a peculiar nature have been met with where the fight receives no affiftance from the ufe of either convex or concave glaffes. To remedy this, the following method was contrived and fuccefsfully adopted. A man about fixty years of age having almoft entirely loft his fight, could fee nothing but a kind of thick mift with little black fpecks in it which feemed to float in the air. He could neither read, walk the ftreets, nor diftinguifh his friends who were moft familiar to him. In this deplorable fituation he procured fome fpectacles with large rings; and having taken out the glaffes, glasses, he substituted for them a conic tube of black Spanish copper. Looking through the large end of the cone he could read the smallest print placed at its other extremity. These tubes were of different lengths, and the openings at the end were also of different sizes; the smaller the aperture the better could he distinguish the smallest letters; the larger the aperture the more words or lines it commanded; and consequently the less occasion was there for moving the head and the hand in reading. Sometimes he used one eye, sometimes the other, alternately relieving each, for the rays of the two eyes could not unite upon the same object when thus separated by two opaque tubes. The thinner these tubes, the less troublesome are they. They must be totally blackened within so as to prevent all shining, and they should be made to lengthen or contract, and enlarge or reduce the aperture at pleasure.

When he placed convex glasses in these tubes, the letters indeed appeared larger, but not so clear and distinct as through the empty tube: he also found the tubes more convenient when not fixed in the spectacle rings; for when they hung loosely they could be raised or lowered with the hand, and one or both might be used as occasion required. It is almost needless to add, that the material of the tubes is of no importance, and that they may be made of iron or tin as well as of copper, provided the insides of them be sufficiently blackened *.

* Monthly Mag. 1795.

Ocular SPECTRA, images presented to the eye after removing them from a bright object, or closing them. When any one has long and attentively looked at a bright object, as at the setting sun, on closing his eyes, or removing them, an image, which resembles in form the object he was attending to, continues some time to be visible. This appearance in the eye we shall call the ocular spectrum of that object.

Phil. Trans. 1786.

These ocular spectra are of four kinds: 1st, Such as are owing to a less sensibility of a defined part of the retina, or spectra from defect of sensibility. 2d, Such as are owing to a greater sensibility of a defined part of the retina, or spectra from excess of sensibility. 3d, Such as resemble their object in its colour as well as form; which may be termed direct ocular spectra. 4th, Such as are of a colour contrary to that of their object, which may be termed reverse ocular spectra.

SPECTRE, an apparition, or something supposed to be preternaturally visible to human sight, whether the ghosts of dead men or beings superior to man.

A belief that supernatural beings sometimes make themselves visible, and that the dead sometimes revisit the living, has prevailed among most nations, especially in the rudest stages of society. It was common among the Jews, among the Greeks, and among the Romans, as we find from the Scriptures, and from the poems of Homer and Virgil. Celestial appearances were indeed so often exhibited to the Jews, that the origin of their belief is not difficult to be explained.—The Divine Being manifested himself to each of the patriarchs by some sensible sign, generally by a flame of fire, as he did to Moses. Under this semblance also did he appear to the Israelites during their abode in the desert, and after they obtained a settlement in the land of Canaan. Nor did they believe that heavenly beings alone assumed a sensible appearance: They believed that deceased men also sometimes revisited this world. When Saul went to consult the witch at Endor, he asked her to bring up the person whom he should name unto her; a proof that he considered his demand as easy to be performed, and therefore that he probably acted under the influence of popular opinion. The same opinions had been generally entertained at a much earlier period; for necromancy and witchcraft, the arts by which the dead were supposed to be raised, had been prohibited while the Israelites were in the wilderness, and yet untainted with the vices of the Canaanites. They must therefore have derived them from Egypt, the cradle of superstition, as well as of the arts and sciences.

Among the Greeks and Romans the apparition of spectres was generally believed. On innumerable occasions the gods are said to have discovered themselves to the eyes of mortals, to have held conferences, and to have interposed their aid. The ghosts of the dead, too, are said to have appeared. When Æneas, amidst the distraction and confusion of his mind in flying from the destruction of Troy, had lost his wife by the way, he returned in search of her. Her shade appeared to him (for she herself had been slain) with the same aspect as before, but her figure was larger. She endeavoured to assuage the grief of her unhappy husband, by ascribing her death to the appointment of the gods, and by foretelling the illustrious honours which yet awaited him. But when Æneas attempted to clasp her in his arms, the phantom immediately vanished into air. From this story we may observe, that the ancients believed that the umbræ or shades, retained nearly the same appearance after death as before; that they had so far the resemblance of a body as to be visible; that they could think and speak as formerly, but could not be touched. This description applies equally well to those shades which had passed the river Styx, and taken up their residence in the infernal regions. Such were the shades of Dido, of Deiphobus, and all those which Æneas met with in his journey through the subterraneous world.

It appears from the writings of modern travellers who have visited rude and savage nations, that the belief of spectres is no less common among them. Mr Bruce tells us, that the priest of the Nile affirmed, that he had more than once seen the spirit of the river in the form of an old man with a white beard. Among the Mahometans the doctrine of spectres seems to be reduced to a regular system, by the accounts which they give of genii. Whoever has read the Arabian Nights Entertainments must have furnished his memory with a thousand instances of this kind. Their opinions concerning genii seem to be a corrupted mixture of the doctrines of the Jews and ancient Persians. In Christian countries, too, notwithstanding the additional light which their religion has spread, and the great improvement in the sciences to which it has been subservient, the belief of ghosts and apparitions is very general, especially among the lower ranks. They believe that evil spirits sometimes make their appearance in order to terrify wicked men, especially those who have committed murder.—They suppose that the spirits of dead men assume a corporeal appearance, hover about church-yards and the houses of the deceased, or haunt the places where murders have been committed. (See Ghost.) In some places it is believed that beings have been seen bearing a perfect resemblance to men alive. In the Highlands of Scotland, what is called the second sight is still believed

lieved by many (see *SECOND Sight*); viz. that future events are foretold by certain individuals by means of spectral representation.

So general has the belief of spectres been, that this circumstance alone may be thought by some sufficient to prove that it must have its foundation in human nature, or must rest upon rational evidence. When any doctrine has been universally received by all nations, by generations living several thousand years from one another, and by people in all the different stages of society, there is certainly the strongest presumption to conclude that such a doctrine has its foundation in reason and in truth. In this way we argue in favour of the existence of a God, concerning moral distinction, and the doctrine of a future state: and certainly so far we argue well. But if the same argument be applied to idolatry, to sacrifices, or to apparitions, we shall find that it is applied improperly. Idolatry was very general among ancient nations; so was the offering of sacrifices, so was polytheism: but they were by no means universal. Should we allow, for the sake of shortening the argument, that all ancient nations were polytheists and idolaters, and presented oblations to their imaginary deities, all that could be concluded from this concession is, that they fell into these mistakes from their ignorance and from the rude state of society, from which their imperfect knowledge of theology and moral philosophy was never able to rescue them. These erroneous notions fled before the brightness of the Christian system; while the doctrines of the existence of God, of moral distinction, and of a future state, have been more thoroughly confirmed and ascertained. The same thing may be said of the belief of spectres. However generally it has been adopted in the first stages of society, or by civilized nations who had made but little progress in the study of divine things, it has been rejected, we may say invariably, wherever theology and philosophy have gone hand in hand.

As all popular and long established opinions are objects of curiosity and research for the philosopher, we think the belief of spectres worthy of some attention even in this light. It will therefore, we hope, give some satisfaction to the philosophical reader to see a short account of the sources or principles from which this belief is derived. But as the belief of spectres is connected with other opinions which appear to us highly injurious to religion; opinions which have been supported by many learned men, and which are still believed by some men of literary education—it will also be proper, in the first place, to consider the evidence on which this belief rests, in which we must consider both their probability and credibility.

In the present investigation we mean to set aside altogether the celestial appearances recorded in Scripture, as being founded on unquestionable evidence, and perfectly agreeable to those rules by which the Deity acts in the usual course of his Providence. The Israelites, during the existence of their state, were immediately under the authority of God, not only as the moral governor of the world, but as the king of Israel. In the infancy of the world, while men were rude and unenlightened, and entirely under the influence of idolatry, many revelations were necessary to preserve in their minds pure ideas of the nature of God, and of the worship due to Him. They were necessary also to pave the way for that illustrious dispensation which the Lord Jesus came from Heaven to diffuse over the world. Every celestial appearance recorded in Scripture was exhibited for some wise and important purpose, which must be apparent to every person who considers these appearances with attention. But when the Scriptures were written and published, and the Christian religion fully established, revelation ceased, and miracles and heavenly messages were no longer requisite. What credit then ought we to give to those marvellous stories related in ancient authors concerning prodigies in the heavens, and the apparition of angels both good and bad?

It is not pretended that any of those prodigies and appearances were exhibited for purposes equally great and important with those which are described in Scripture: And can we suppose that the all-wise Governor of the world would permit his angels to render themselves visible to the eye of man for no purpose at all, or for a purpose which might have been equally well accomplished without their interposition? Would this be consistent with perfect wisdom, or would it be consistent even with the excellence and superiority of understanding which we are taught to ascribe to these elevated beings? The whole will of God is revealed to us in the Scriptures; what further use for the visible interposition of angels? It may be objected, Are they not all ministering spirits, sent forth to minister for them who shall be heirs of salvation *? We answer, That angels may animate and support good men by an invisible interposition. But the Apostle is not speaking of celestial spirits. The word αγγελος signifies "a messenger;" and in Scripture often refers to men. In the passage which we are now reviewing it certainly is applied with much more propriety to men than to angels: for the Apostle is stating a comparison between *the Prophets*, by whom God, at sundry times and in divers manners, spake in time past to the fathers, and *the Son*, by whom he hath spoken in these last days.

* Heb. i. 14.

And if God has given no commission to his angels to deliver to men since the publication of the Christian religion, is there any probability that he would give any commission or any licence to evil spirits? It will be said, that this doctrine is clearly taught in the New Testament, in these words, "The devil goeth about as a roaring lion seeking whom he may devour." We will not avail ourselves of the interpretation of some, who say that the word *devil*, which in the Greek language signifies an *adversary*, or *slanderer*, refers here to some human being, who was a violent enemy of the Christians. All that can be deduced from these words, upon the supposition that they refer to a malignant spirit, is merely that he goeth about seducing men to vice. But it is not by assuming a hideous form, and presenting himself to the midnight traveller, that such a purpose is to be accomplished. A spirit may probably have direct access to our minds without the intervention of any thing corporeal; and by exciting our passions may plunge us into vice, which is the only object such a being is supposed to have in view. None of the marvellous stories which we have heard concerning the apparition of evil spirits lead us to conclude that they appear to entice men to commit crimes. We never heard of any evil spirit that required men to steal, to perpetrate robbery or murder. They only appeared to terrify some crazy timorous individuals, who have whims and fancies

Spectre. enow of their own to agitate their minds, though no preternatural vision should ever appear to them. It is not consistent, therefore, with the character of God, and what he has revealed to us of his will, to believe that he would commission good angels, or permit evil angels, to appear to men since the propagation of the gospel, or indeed at any former period of the world, unless some great and mighty purpose was to be fulfilled. It is not consistent with what we know of the nature of good or bad angels to suppose, that though permission were granted them occasionally to show themselves to men, that they would appear in that way which story-tellers describe.

It is equally improbable that the spirits of the dead who have removed from this world should again be permitted to visit it. At death men undergo as great, perhaps a greater change, than when they came first into the light of the sun. Is it not therefore as improbable that a man should return in a visible corporeal form after death, as that, after having arrived at manhood, he should return to the state in which he was before his birth? Such changes as these are evidently made permanent by the invariable laws of nature. But suppose it were possible, for what purpose should they return? To describe to us what is passing in the other world, to animate us to virtue, by informing us of the rewards which there await the good; or to alarm us, by describing the punishment of the wicked. These seem important reasons. But Divine Providence has wisely thrown a veil over futurity. We know every thing of the other world from the scripture which it is proper for us at present to know. And as to incentives to virtue, we are already blessed with a number sufficiently great and powerful for moral beings, who are to act from rational motives, and not from compulsion. "He that will not hear Moses and the prophets, will not be persuaded though one rose from the dead."

There is one strong objection against the probability of spectres, which is sufficient to prove that they are not intelligent creatures; or at least that they possess so small a degree of intelligence, that they are unqualified to act with prudence, to propose any end to themselves, or use the proper means to accomplish that end. Ghosts often appear in order to discover some crime that has been committed: but they never appear to a magistrate, or person in authority, but to some illiterate clown, who happens to live near the place where the crime was perpetrated; to some person who has no connection with the affair at all, and who in general is the most improper in the world for making the discovery. For instance, in Glanville's *Saducismus triumphatus* (a book written in the last century by a chaplain of Charles II. in support of the common opinions respecting witchcraft and apparitions), we have the following story: James Haddock, a farmer, was married to Elenor Welsh, by whom he had a son. After the death of Haddock, his wife married one Davis; and both agreed to defraud the son by the former marriage of a lease bequeathed to him by his father. Upon this the ghost of Haddock appeared to one Francis Taverner the servant of Lord Chichester, and desired him to go to Elenor Welsh, and to inform her that it was the will of her former husband that their son should enjoy the lease. Taverner did not at first execute this commission; but he was continually haunted by the apparition in the most hideous shapes, which even threatened to tear him in pieces, till at last he delivered the message. Now, had this spectre had the least common sense, it would have appeared first to Elenor Welsh and her husband Davis, and frightened them into compliance at once, and not have kept poor Taverner in such constant disquietude, who had no concern in the matter.

Another very odd circumstance respecting apparitions in general must not be omitted, which is, that they have no power to speak till they are addressed. In the 27th of Glanville's Relations we read of an old woman that appeared often to David Hunter, a neat-herd, at the house of the bishop of Down and Conners. Whenever she appeared, he found himself obliged to follow her; and for three quarters of a year poor David spent the whole of almost every night in scampering up and down through the woods after this old woman. How long this extraordinary employment might have continued, it is impossible to guess, had not David's violent fatigue made him one night exclaim, "Lord bless me! would I were dead!—shall I never be delivered from this misery!" On which the phantom replied, "Lord bless me too! It was happy you spoke first, for till then I had no power to speak, though I have followed you so long." Then she gave him a message to her two sons, though David told her he remembered nothing about her. David, it seems, neglected to deliver the message; at which the old beldam was so much provoked, that she returned and hit him a hearty blow on the shoulder, which made him cry out, and then speak to her. Now if she could not speak till David addressed her, why might she not have applied this oratorial medicine the first time she appeared to him? It would have saved both herself and him many a weary journey; and certainly David would much rather have had even half a dozen of blows from her choppy fists than have wanted so many nights sleep. To complete the story, we must add, that when David's wife found it impossible to keep him from following the troublesome visitor, she trudged after him, but never was gratified with a sight of the enchantress. David's little dog too was a dutiful attendant on his master during his pilgrimage.

It is remarked by Glanville, that ghosts are generally very eager to be gone. Indeed they are often so much so, that they do not stay to tell their errand. One would be induced from this, as well as the circumstances already mentioned, to think that they are the stupidest and dullest of the dead that assume the appearance of ghosts; unless we adopt the ingenious solution of Glanville, "that it is a very hard and painful thing for them to force their thin and tenuious bodies into a visible consistence; that their bodies must needs be exceedingly compressed; and that therefore they must be in haste to be delivered from the unnatural pressure."

With respect to the *evidence* in favour of spectres, if examined ever so slightly, it will be found very defective. They only appear to one person at a time; they are seen only in the night; they are visible only to ignorant, illiterate, and credulous persons, and never present themselves before men of education and learning.

That spectres only appear to one person at a time, even though there are more in company, is an objection against the credibility of their appearance quite insurmountable.

Spectre.

mountable. How is it poffible that two men of eye-fight equally good, directing their eyes to the fame fpot, fhould not fee fo large an object as that of a man or woman at a fmall diftance equally well? Some will tell us that a mift is caft over the eyes of the one, while the view of the other is free from obftruction. But how is this to be proved? and befides, what purpofe would it ferve? Ghofts have feldom any fecrets to difclofe; they might be proclaimed to a multitude with as much propriety as confined to one perfon. Shall we be told, that the fpectre has the power of becoming vifible to fome, and of remaining invifible to others? This cannot be allowed without adopting opinions deftructive to revealed religion; for it would be a miracle: and we cannot be perfuaded, without evidence, that God would empower any inferior being to controul at pleafure the wife laws which he has ordained for governing the world. To him who is of a different opinion, we would recommend Farmer on Miracles; a book in which this queftion is fully examined.

Spectres appear only in the night. But why fhould they fhun the light of the fun? Thofe mifchievous ghofts that Glanville mentions might indeed have fome reafon to choofe midnight for the execution of their pranks, as they would be more eafily detected in open day. Such was the roguifh drummer that haunted Mr Mompeffon's houfe, who beat his drum all night, threw the old gentlewoman's clothes about the room, hid her Bible in the afhes, plucked the clothes off the bed, and amufed himfelf with toffing about Mr Mompeffon's fhoes. But why fhould a grave ferious ghoft appear at midnight? Might it not deliver its meffage with as much eafe and more fuccefs in the day-time? In the day-time it would not excite much fear; it would be liftened to therefore with more attention; and did it choofe to exhibit itfelf before a number of witneffes, its grievances would be more fpeedily redreffed, becaufe more perfons would intereft themfelves in feeing juftice done to the injured ghoft.

Spectres not only choofe the moft improper time, but the moft improper perfons. To render the teftimony of any perfon credible, he muft not only be a man of veracity, but he muft have fufficient ability to judge of the fubject to which he is to bear witnefs. It is not on the evidence of an ignorant illiterate perfon, who has more fancy and fear than judgement, that we are to reft our belief of what is fupernatural. It is alfo worthy of remark, that we have never heard of a ghoft appearing to any perfon who did not previoufly believe their exiftence. A man muft be prejudiced in favour of this opinion, or he will never fee a ghoft. But fenfible men know, that he who has been accuftomed to hear frightful ftories of ghofts and apparitions gliding through a churchyard, or haunting fome particular place, can fcarcely pafs through a churchyard, or haunted fpot without conjuring up in his imagination the hideous phantoms which he has been accuftomed to affociate with fuch places. Is it ftrange, then, that an ignorant man, with a mind uncultivated and uninformed, with all the prejudices of the nurfery about him, fhould imagine he fees ghofts in thofe places where he believes they hover, efpecially in the dead hour of midnight, when, with the flighteft aid of the imagination, a cow may be turned into a monftrous phantom, and the reflection of the beams of the moon from a little water be converted into a ghoft with a winding-fheet? But why fhould apparitions fhun men of underftanding and learning? Why fhould learning be formidable to them (A)? It was not fo with the celeftial meffengers mentioned in the Scriptures: they appeared to the patriarchs and prophets; and the miracles there recorded were performed in the moft public places, before the eyes of Rabbies, of Scribes, and Pharifees. Indeed this circumftance is fufficient to deftroy the evidence of fpectres. They have never been feen by any but men of weak or diftempered minds, or by men who have previoufly believed in them.

Having now confidered the evidence on which the belief of fpectres refts, we will endeavour to give fome account of the foundation of it. To trace an opinion that has prevailed fo generally in the world to its fource, is a labour not unworthy of the philofopher, even though the opinion be falfe. It is always gratifying to detect the caufes of error: it is no lefs ufeful; for in order to refute error, it is often fufficient to point out the fources from which it has fprung. To reach the origin of the belief of fpectres is not more difficult than to account for idolatry or polytheifm. In the infant ftate of the intellectual powers every thing is confidered as poffeffing life and intelligence. The child beats the ftool

(A) The celebrated hiftorian De Thou had a very fingular adventure at Saumur, in the year 1598. One night, having retired to reft very much fatigued, while he was enjoying a found fleep, he felt a very extraordinary weight upon his feet, which, having made him turn fuddenly, fell down and awakened him. At firft he imagined that it had been only a dream, but hearing foon after fome noife in his chamber, he drew afide the curtains and faw, by help of the moon, which at that time fhone very bright, a large white figure walking up and down, and at the fame time obferved upon a chair fome rags, which he thought belonged to thieves who had come to rob him. The figure then approaching his bed, he had the courage to afk it what it was. "I am (faid it) the Queen of Heaven." Had fuch a figure appeared to any credulous ignorant man in the dead of night, and made fuch a fpeech, would he not have trembled with fear, and have frightened the whole neighbourhood with a marvellous defcription of it? But De Thou had too much underftanding to be fo impofed upon. Upon hearing the words which dropped from the figure, he immediately concluded that it was fome mad woman, got up, called his fervants, and ordered them to turn her out of doors; after which he returned to bed and fell afleep. Next morning he found that he had not been deceived in his conjecture, and that having forgot to fhut his door, this female figure had efcaped from her keepers, and entered his apartment. The brave Schomberg, to whom De Thou related his adventure fome days after, confeffed that in fuch a cafe he would not have fhown fo much courage. The king alfo, who was informed of it by Schomberg, made the fame acknowledgement.

ſtool over which he has fallen with the ſame paſſion that he would treat his companion: The young girl talks to her doll as if it underſtood her: The ſavages aſcribe every change which they obſerve on the face of nature to the action of ſome animated being. As knowledge advances, they ſingle out thoſe beings which ſeem to produce the moſt ſtriking effects, arrange them into ſome kind of order, and divide the government of the world among them. Unable, at the ſame time, to conceive any notion of a pure ſpirit, they imagine thoſe divinities are corporeal beings. This is the foundation of idolatry. The belief of ſpectres is but another ſtep. That theſe animated corporeal beings, to whom they addreſs their prayers, and who preſide over the world, ſhould on particular occaſions diſplay themſelves to the human eye, is what they muſt be previouſly diſpoſed to expect. Hence the numberleſs appearances of the heathen gods, of the Perſian and Mahometan genii. The belief of ghoſts may be eaſily deduced from the opinions entertained reſpecting a future ſtate. Theſe opinions are founded on that eſſential doctrine of natural religion, that there is another world in which men ſhall exiſt when death has removed them hence. This doctrine has been univerſally received both by ſavage and civilized nations; but, as might be expected, men have formed very different ſentiments concerning the nature of a future ſtate, of the ſituation and employments of departed ſpirits, according to the degree of knowledge which they poſſeſſed. But the general opinion in ancient and rude nations was, that departed ſpirits retained the ſame external appearance, the ſame paſſions and principles as before. Nothing therefore was more natural than the opinion, that they might occaſionally reviſit this world, from an anxious deſire to alleviate the ſufferings of thoſe beloved friends and relations whom they had left behind them, or to communicate from the unſeen world what might be important to their welfare. Upon ſuch an errand did Creüſa appear to Æneas. The apparition of the ghoſts of murderers is eaſily explained upon the ſame general principles. The remorſe and horror of mind which the murderer feels are ſuppoſed to haunt him in the other world, and to render his ſituation there intolerable (eſpecially if the murder was never detected and puniſhed), till he return and give information againſt himſelf. In this way, then, we think it highly probable the belief of ſpectres has originated. But many other cauſes concur to confirm and propagate this belief. Theſe are, imperfect viſion united with fear, dreams, opium, diſeaſes, drunkenneſs, and opium.

1. Indiſtinct viſion is one ſource of apparitions, eſpecially when the mind is under the influence of fear. It is well known, that the ſenſe of ſeeing conveys no idea of diſtance till improved by experience and obſervation; and how we come at length to diſtinguiſh objects at a diſtance from thoſe that are near, has been explained in another place (ſee METAPHYSICS, N° 50.).

In the daytime we ſeldom commit miſtakes, becauſe we know the object at which we look; but at night, when we ſee objects obſcurely, and know not what they are, we have no diſtinct idea either of their diſtances or of their magnitude. We may miſtake a buſh that is near us for a tree at a diſtance; or if the imagination be under the influence of fear, it will eaſily convert it into a gigantic figure. "It is generally aſſerted (ſays Buffon) that theſe figures exiſt only in the imagination; yet they may have a real exiſtence in the eye; for whenever we have no other mode of judging of an unknown object but by the angle it forms in the eye, its magnitude will uniformly increaſe in proportion to its propinquity. If it appears, when at the diſtance of 20 or 30 paces, to be only a few feet high, its height, when within two or three feet of the eye, will be many fathoms. An object of this kind muſt naturally excite terror and aſtoniſhment in the ſpectator, till he approaches and recogniſes it by actual feeling; for the moment a man knows an object, the gigantic appearance it aſſumed in the eye inſtantly diminiſhes, and its apparent magnitude is reduced to its real dimenſions. But if, inſtead of approaching ſuch an object, the ſpectator flies from it, he can have no other idea of it but from the image which it formed in his eye; and, in this caſe, he may affirm with truth that he ſaw an object terrible in its aſpect, and enormous in its ſize. Thus the notions concerning ſpectres is founded in nature, and depend not, as ſome philoſophers affirm, upon the imagination alone."

In addition to theſe obſervations of Buffon, we may take notice, that objects are always magnified in a fog; ſo that when a fog happens in the night-time, objects may be magnified to an enormous ſize. But, at any rate, whether there be fog in the night or not, there is ſuch a great analogy between darkneſs and a fog, that if the latter deceive us with reſpect to the ſize of objects, the former will alſo deceive us. The writer of this article was paſſing the frith of Forth at Queensferry, near Edinburgh, one morning which was extremely foggy. Though the water be only two miles broad, the boat did not get within ſight of the ſouthern ſhore till it approached very near it. He then ſaw to his great ſurpriſe a large perpendicular rock, where he knew the ſhore was low and almoſt flat. As the boat advanced a little nearer, the rock ſeemed to ſplit perpendicularly into portions, which ſeparated at a little diſtance from one another. He next ſaw theſe perpendicular diviſions move; and upon approaching a little nearer, found it was a number of people ſtanding on the beach, waiting the arrival of the ferry-boat.

2. Dreams are another fertile ſource of apparitions. It is well known to every perſon, that while the mind is under the influence of a dream it conſiders it as much a reality as it does any particular action while awake. Now if a perſon of a weak ſuperſtitious mind ſhould have a very lively dream, which intereſts his paſſions, particularly the paſſion of fear, it may make ſo deep an impreſſion, that he may be firmly convinced that he has actually ſeen with his eyes what has only paſſed before his imagination (ſee APPARITION) (B). We ſhall here tell a ſtory, by way of illuſtration, which we have

(B) When the thoughts are much troubled, and when a perſon ſleeps without the circumſtances of going to bed, or putting off his clothes, as when he nods in his chair, it is very difficult, as Hobbes remarks, to diſtinguiſh a dream from a reality. On the contrary, he that compoſes himſelf to ſleep, in caſe of any uncouth or abſurd fancy, eaſily ſuſpects it to have been a dream.—*Leviathan*, par. i. c. 1.

Spectre.

have received on unquestionable authority. An East India captain had an honest faithful servant named *John*, for whom he had a great regard. John died, if we recollect right, on a voyage from England to the East Indies during a French war. As the ship approached the place of its destination the captain had a dream, in which John appeared to him, and earnestly besought him not to sail to the port for which he was bound, as it was in the hands of the French. The captain, though not addicted to superstition, thought it prudent to follow this admonition; and after landing at a different port, he was informed that the place to which he had intended to steer was, according to the information of the dream, captured by the French. On the voyage home, the captain had a second dream, in which John again appeared to him, and gave him notice that he should soon die, and that the ship should be taken in the mouth of the Channel by the French. Next morning the captain called his first mate, told him his dream, which he believed was prophetic, and delivered his papers, that he might take proper care of them after his decease. Every thing happened exactly as the dream had foretold; the captain died, and the vessel was taken by a French man of war in the mouth of the Channel. This dream, wonderful as it appears, is easily explained. In the voyage out to India, nothing was more natural than that the captain should sometimes be thinking, that amidst the various chances of war, the port to which he was bound might be taken; perhaps it was a place of consequence, which the French might be eager to possess. The captain being accustomed to revolve these thoughts in the day-time, they would naturally return at night; the regret which he felt for the loss of a faithful servant might mingle with his apprehensions, and thus produce the dream. Perhaps the advice was such as John would have given had he been alive. It is equally easy to explain the cause of the dream in the passage home. The captain, we are told, was very ill, and thought himself dying, at the very time he had the second dream, and therefore did not expect to reach England. This part of the dream, then, was only his own thoughts, delivered by his servant. As to the other part, that his ship should be taken in the mouth of the Channel, it may be thought unaccountable how the very place should be foreseen. But we must recollect, that the mouth of the Channel, being over against the coast of France, was by far the most dangerous place in the whole passage; and that, therefore, the captain had more reason to be afraid of losing his ship there than in any other place. The use which we mean to make of this story is this: Had the captain been a man of a weak mind, he would certainly have considered the dream as a reality, and believed that, instead of having dreamed of the things on which his imagination had dwelt, he had actually seen his servant return from the dead, and heard him deliver the message. But, on the other hand, the captain, though he believed the dream was prophetic, mentioned it without any signs of fear; and no man of courage and reflection ever sees an apparition. This sight is reserved for the weak, the timid, and the superstitious. Of this many instances might be mentioned.

3. Spectres are also sometimes occasioned by opium. Gassendi the philosopher found a number of people going to put a man to death for having intercourse with the devil; a crime which the poor wretch readily acknowledged. Gassendi begged of the people that they would permit him first to examine the wizard before putting him to death. They did so; and Gassendi, upon examination, found that the man firmly believed himself guilty of this impossible crime. He even offered to Gassendi to introduce him to the devil. The philosopher agreed; and when midnight came, the man gave him a pill, which he said it was necessary to swallow before setting off. Gassendi took the pill, but gave it to his dog. The man having swallowed his, fell into a profound sleep; during which he seemed much agitated by dreams. The dog was affected in a similar manner. When the man awoke, he congratulated Gassendi on the favourable reception he had met with from his sable highness. It was with difficulty Gassendi convinced him that the whole was a dream, the effect of soporific medicines, and that he had never stirred from one spot during the whole night.

Spectre.

4. That diseases, especially the night-mare, the hypochondria, hysteric passion, and madness, are another source of spectres, we have the strongest reason to affirm. Persons subject to the night-mare often imagine that they see spectres. This is still more the case with hypochondriac and hysteric persons, and those who are in any degree deranged in their intellects. A fact which fell within the observation of the writer of this article will both prove and illustrate this assertion. In a village in one of the midland counties of Scotland, lived a widow distinguished among her neighbours for decency of manners, integrity, and respect for religion. She affirmed, that for several nights together she had heard a supernatural voice exclaiming aloud, *Murder! murder!* This was immediately reported through the neighbourhood; all were alarmed, and looked around them with solicitude for the detection of the murder which they supposed to have been committed; and it was not long till a discovery seemed actually to be made. It was reported, that a gentleman, who had relations at no great distance, and had been residing in the West Indies, had lately arrived with a considerable fortune; that he had lodged in an inn about three miles off; and that he had afterwards been seen entering a house in the village where the widow lived, from which he had never returned. It was next affirmed, that a tradesman passing the churchyard about twelve at midnight had seen four men carry a dead corpse into that cemetery. These three facts being joined together seemed perfectly to agree and to confirm one another, and all believed some horrible murder had been committed. The relations of the gentleman thought they were called upon to make inquiry into the truth of these allegations: they accordingly came first to the churchyard, where, in company with the sexton, they examined all the graves with great care, in order to discover whether any of them had been lately dug, or had the appearance of containing more than one coffin. But this search was to no purpose, for no alteration had been made upon the graves. It was next reported that the murdered man had been buried in a plantation about a mile distant from the village. As the alarm was now very general, a number of the inhabitants proposed of their own accord to explore it. They accordingly spread themselves over the wood, and searched it with care, but no grave nor new dug earth was found. The writer of this article, who was then a boy at school, was along with them. The matter

ter

ter did not rest here: The person who was said to have seen four men carry a dead corpse into the churchyard at midnight was summoned to appear before a meeting of the justices of the peace. Upon examination he denied any knowledge of the affair, but referred the court to another person from whom he had received his information. This person was examined, and the result was the same as the former. In short, one person had heard it from another, who had received it from a third, who had heard it from a fourth; but it had received a little embellishment from every person who repeated it. It turned out to be the same with Smollet's story of the three black crows, which some body was said to have vomited.

Upon inquiry at the inn where the West Indian gentleman had lodged, no such gentleman had been seen there. It was found afterwards he had never left the West Indies. Still, however, the veracity of the widow was not disputed; and some dark and secret transaction was suspected. But the whole affair was at length explained by discovering that she was somewhat deranged by melancholy. And the cries which she had at first imagined she had heard were afterwards imitated by some roguish person, who was highly amused with spreading terror among the credulous.

5. Drunkenness also has the power of creating spectres. Its natural effect in most cases is to derange the understanding, to throw it off its guard, and to give full scope to that passion which has a natural disposition to gain an ascendancy; and sometimes it excites passions which scarcely seem to exist at any other time. It makes some men licentious, some furious, some all benevolence and kindness, some from being cowards it renders undaunted heroes. It seldom, if ever, excites fear; and therefore it may be thought strange that men should imagine they see ghosts when intoxicated. But it must be remarked, that the ghosts which the drunkard sees, he sees not with the same alarm and terror as men who are sober. He is not afraid of them. He has the courage to converse with them, and even to fight with them, if they give him provocation. A man returning home intoxicated, affirmed that he had met with the devil; and that after a severe encounter he had vanquished him and brought him to the ground, to which he had nailed him fast by driving his staff through his body. Next morning the staff was found stuck with great violence into a heap of turfs!

6. Many apparitions of spectres have no other origin than the artifices of the waggish or self-interested. Dr Plot, in his Natural History of Oxfordshire, relates a marvellous story, which will illustrate this assertion. Soon after the murder of King Charles I. a commission was appointed to survey the king's house at Woodstock, with the manor, park, woods, and other demesnes to that manor belonging; and one Collins, under a feigned name, hired himself as secretary to the commissioners, who, upon the 13th of October 1649. met, and took up their residence in the king's own rooms. His majesty's bed-chamber they made their kitchen, the council hall their pantry, and the presence-chamber was the place where they sat for the dispatch of business. His majesty's dining-room they made their wood yard, and stored it with the wood of the famous royal-oak from the High Park, which, that nothing might be left with the name of king about it, they had dug up by the roots, and split and bundled up into faggots for their firing. Things being thus prepared, they sat on the 16th of the same month for the dispatch of business; and in the midst of their first debate there entered a large black dog (as they thought, which made a dreadful howling, overturned two or three of their chairs, and then crept under a bed and vanished. This gave them the greater surprise, as the doors were kept constantly locked, so that no real dog could get in or out. The next day their surprise was increased, when sitting at dinner in a lower room, they heard plainly the noise of persons walking over their heads, though they well knew the doors were all locked, and there could be no body there. Presently after they heard also all the wood of the king's oak brought by parcels from the dining-room, and thrown with great violence into the presence chamber; as also all the chairs, stools, tables, and other furniture, forcibly hurried about the room; their papers, containing the minutes of their transactions were torn, and the ink-glass broken. When all this noise had ceased, Giles Sharp, their secretary, proposed to enter first into these rooms; and in presence of the commissioners, from whom he received the key, he opened the doors, and found the wood spread about the room, the chairs tossed about and broken, the papers torn, the ink-glass broken (as has been said), but not the least track of any human creature, nor the least reason to suspect one, as the doors were all fast, and the keys in the custody of the commissioners. It was therefore unanimously agreed, that the power who did this mischief must have entered the room at the key-hole. The night following, Sharp the secretary, with two of the commissioners servants, as they were in bed in the same room, which room was contiguous to that where the commissioners lay, had their bed's feet lifted up so much higher than their heads, that they expected to have their necks broken, and then they were let fall at once with so much violence as shook the whole house, and more than ever terrified the commissioners. On the night of the 19th, as all were in bed in the same room for greater safety, and lights burning by them, the candles in an instant went out with a sulphureous smell, and that moment many trenchers of wood were hurled about the room, which next morning were found to be the same their honours had eaten on the day before, which were all removed from the pantry, though not a lock was found opened in the whole house. The next night they fared still worse; the candles went out as before, the curtains of their honours beds were rattled to and fro with great violence; their honours received many cruel blows and bruises, by eight great pewter-dishes and a number of wooden trenchers being thrown on their beds, which being heaved off, were heard rolling about the room, though in the morning none of these were to be seen. This night likewise they were alarmed with the tumbling down of oaken billets about their beds, and other frightful noises; but all was clear in the morning, as if no such thing happened. The next night the keeper of the king's house and his dog lay in the commissioners room, and then they had no disturbance. But on the night of the 22d, though the dog lay in the room as before, yet the candles went out, a number of brick-bats fell from the chimney into the room, the dog howled piteously, their bed clothes were all stripped off, and their terror increased. On the

Spectre. 24th they thought all the wood of the king's oak was violently thrown down by their bed fides; they counted 64 billets that fell, and fome hit and fhook the beds in which they lay; but in the morning none were found there, nor had the door been opened where the billet wood was kept. The next night the candles were put out, the curtains rattled, and a dreadful crack like thunder was heard; and one of the fervants running in hafte, thinking his mafter was killed, found three dozen of trenchers laid fmoothly under the quilt by him. But all this was nothing to what fucceeded afterwards: The 29th, about midnight, the candles went out, fomething walked majeftically through the room, and opened and fhut the windows; great ftones were thrown violently into the room, fome of which fell on the beds, others on the floor; and at about a quarter after one a noife was heard as of forty cannon difcharged together, and again repeated at about eight minutes diftance. This alarmed and raifed all the neighbourhood, who coming into their honours room, gathered up the great ftones, fourfcore in number, and laid them by in the corner of a field, where, in Dr Plot's time, who reports this ftory, they were to be feen. This noife, like the difcharge of cannon, was heard through all the country for 16 miles round. During thefe noifes, which were heard in both rooms together, the commiffioners and their fervants gave one another over for loft, and cried out for help; and Giles Sharp, fnatching up a fword, had well nigh killed one of their honours, miftaking him for the fpirit, as he came in his fhirt from his own room to theirs. While they were together, the noife was continued, and part of the tiling of the houfe was ftript off, and all the windows of an upper room were taken away with it. On the 30th at midnight fomething walked into the chamber treading like a bear; it walked many times about, then threw the warming-pan violently on the floor; at the fame time a large quantity of broken glafs, accompanied with great ftones and horfes bones, came pouring into the room with uncommon force. Thefe were all found in the morning to the aftonifhment and terror of the commiffioners, who were yet determined to go on with their bufinefs. But on the firft of November the moft dreadful fcene of all enfued: Candles in every part of the room were lighted up, and a great fire made; at midnight, the candles all yet burning, a noife like the burfting of a cannon was heard in the room, and the burning billets were toffed about by it even into their honours beds; who called Giles and his companions to their relief, otherwife the houfe had been burnt to the ground; about an hour after the candles went out as ufual, the crack as if many cannon was heard, and many pailfuls of green ftinking water were thrown upon their honours beds; great ftones were alfo thrown in as before, the bed curtains and bedfteads torn and broken, the windows fhattered, and the whole neighbourhood alarmed with the moft dreadful noifes; nay, the very rabbitftealers that were abroad that night in the warren were fo terrified, that they fled for fear and left their ferrets behind them. One of their honours this night fpoke, and, *in the name of God, afked what it was, and why it difturbed them fo?* No anfwer was given to this; but the noife ceafed for a while, when the fpirit came again; and, as they all agreed, *brought with it feven devils worfe than itfelf.* One of the fervants now lighted a large candle, and fet it in the door-way between the two chambers, to fee what paffed; and as he watched it, he plainly faw a hoof ftriking the candle and candleftick into the middle of the room, and afterwards making three fcrapes over the fnuff, fcraped it out. Upon this the fame perfon was fo bold as to draw a fword; but he had fcarce got it out when he felt another invifible hand holding it too, and pulling it from him; and at length prevailing, ftruck him fo violently on the head with the pummel, that he fell down for dead with the blow. At this inftant was heard another burft like the difcharge of the broadfide of a fhip of war, and at about a minute or two's diftance each no lefs than 19 more fuch: thefe fhook the houfe fo violently, that they expected every moment it would fall upon their heads. The neighbours, on this, as has been faid, being all alarmed, flocked to the houfe in great numbers, and all joined in prayer and pfalm finging; during which the noife ftill continued in the other rooms, and the difcharge of cannons was heard as from without, though no vifible agent was feen to difcharge them. But what was the moft alarming of all, and put an end to their proceedings effectually, happened the next day as they were all at dinner, when a paper, in which they had figned a mutual agreement to referve a part of the premifes out of the general furvey, and afterwards to fhare it equally amongft themfelves, (which paper they had hid for the prefent under the earth in a pot in one corner of the room, and in which an orange-tree grew), was confumed in a wonderful manner, by the earth's taking fire with which the pot was filled, and burning violently with a blue fume, and an intolerable ftench; fo that they were all driven out of the houfe, to which they could never again be prevailed upon to return.

This wonderful contrivance was all the invention of the memorable Jofeph Collins of Oxford, otherwife called *Funny Joe*, who having hired himfelf as fecretary, under the name of *Giles Sharp*, by knowing the private traps belonging to the houfe, and the help of *pulvis fulminans* and other chemical preparations, and letting his fellow-fervants into the fcheme, carried on the deceit without difcovery to the very laft; infomuch that the Dr Plot, in his Natural Hiftory, relates the whole for fact, and concludes in this grave manner, "That though tricks have been often played in affairs of this kind, many of the things above related are not reconcileable with juggling; fuch as the loud noifes, beyond the power of man to make without fuch inftruments as were not there; the tearing and breaking the beds; the throwing about the fire; the hoof treading out the candle; and the ftriving for the fword, and the blow the man received from the pummel of it."

SPECTRE of the Broken, a fingular phenomenon obferved on the top of the *Broken*, one of the Hartz mountains in Hanover, of which M. Haue has given the following account. "After having been here (fays he) for the thirtieth time, and having procured information refpecting the above-mentioned atmofpheric phenomenon, I was at length, on the 23d of May 1797, fo fortunate as to have the pleafure of feeing it; and perhaps my defcription may afford fatisfaction to others who vifit the Broken through curiofity. The fun rofe about four o'clock, and, the atmofphere being quite ferene towards the eaft, his rays could pafs without any obftruction over the Heinrichfhöhe. In the fouth-weft, however, Spectre ‖ Speculum.

ever, towards Achtermannſhöhe, a briſk weſt wind carried before it thin tranſparent vapours, which were not yet condenſed into thick heavy clouds.

"About a quarter paſt four I went towards the inn, and looked round to ſee whether the atmoſphere would permit me to have a free proſpect to the ſouth-weſt; when I obſerved, at a very great diſtance towards Achtermannſhöhe, a human figure of a monſtrous ſize. A violent guſt of wind having almoſt carried away my hat, I clapped my hand to it by moving my arm towards my head, and the coloſſal figure did the ſame.

"The pleaſure which I felt on this diſcovery can hardly be deſcribed; for I had already walked many a weary ſtep in the hopes of ſeeing this ſhadowy image, without being able to gratify my curioſity. I immediately made another movement by bending my body, and the coloſſal figure before me repeated it. I was deſirous of doing the ſame thing once more—but my coloſſus had vaniſhed. I remained in the ſame poſition, waiting to ſee whether it would return; and in a few minutes it again made its appearance on the Achtermannſhöhe. I paid my reſpects to it a ſecond time, and it did the ſame to me. I then called the landlord of the Broken; and having both taken the ſame poſition which I had taken alone, we looked towards the Achtermannſhöhe, but ſaw nothing. We had not, however, ſtood long, when two ſuch coloſſal figures were formed over the above eminence, which repeated our compliments by bending their bodies as we did; after which they vaniſhed. We retained our poſition; kept our eyes fixed on the ſame ſpot, and in a little the two figures again ſtood before us, and were joined by a third. Every movement that we made by bending our bodies theſe figures imitated—but with this difference, that the phenomenon was ſometimes weak and faint, ſometimes ſtrong and well defined. Having thus had an opportunity of diſcovering the whole ſecret of this phenomenon, I can give the following information to ſuch of my readers as may be deſirous of ſeeing it themſelves. When the riſing ſun, and according to analogy the caſe will be the ſame at the ſetting ſun, throws his rays over the Broken upon the body of a man ſtanding oppoſite to fine light clouds floating around or hovering paſt him, he needs only fix his eyes ſtedfaſtly upon them, and, in all probability, he will ſee the ſingular ſpectacle of his own ſhadow extending to the length of five or ſix hundred feet, at the diſtance of about two miles before him."

SPECULARIS Lapis, compoſed of large plates of extreme thinneſs. (See Talc, Mineralogy *Index*). The white variety with large and broad leaves, commonly called *iſinglaſs and Muſcovy glaſs*, is imported in great quantities; the miniature-painters cover their pictures with it; the lantern-makers ſometimes uſe it inſtead of horn; and minute objects are uſually preſerved between two plates of it, for examination by the microſcope.

SPECULATIVE, ſomething relating to the theory of ſome art or ſcience, in contradiſtinction to practical.

SPECULUM for reflecting teleſcopes, is made of a kind of white copper conſiſting of 32 parts fine red copper, one of braſs, 15 of grain-tin, and three of white arſenic. The proceſs given by the late J. Edwards, who was rewarded by the Board of Longitude for diſcloſing it to the public, was publiſhed in the Nautical Almanack for 1787, and is as follows: Melt the copper in a large crucible, employing ſome black flux, compoſed of two parts of tartar and one of nitre: when melted, add to it the braſs and the ſilver. Let the pure tin be melted in another crucible, alſo with ſome black flux. Take them both from the fire, and pour the melted tin into the fuſed maſs in the large crucible. Stir the whole well with a dry ſpatula of birch, and pour off the fuſed metal immediately into a large quantity of cold water. The ſudden chill of the water will cauſe the fluid metal to divide into an infinite number of ſmall particles, which will cool inſtantly.

Speculum. *Cronſtedt's Mineralogy*, vol. ii. p. 712.

If the copper be completely ſaturated, the fracture of one piece of this mixed metal will appear bright, and of a gloſſy look, reſembling the face of pure quickſilver. But if it is of a brown reddiſh colour, it wants a little more tin. To aſcertain the required proportion, melt a ſmall quantity, known by weight, of the mixed metal, with a known very ſmall part of tin; and, if neceſſary, repeat the trial with different doſes, till the fracture of the new mixture looks as already deſcribed. Having now aſcertained the neceſſary addition of tin that is required, proceed to the laſt melting of the whole metal, together with the additional proportional doſe of tin; fuſe the whole, obſerving the ſame cautions as before; and you will find that the mixture will melt with a much leſs heat than that for the firſt fuſion. Have ready as many ounces of white arſenic in coarſe powder as there are pounds in the weight of the metal; wrap up the arſenic in a ſmall paper, and put it, with a pair of tongs, into the crucible; ſtir it well with the ſpatula, retaining the breath to avoid the arſenical fumes or vapours (which however are not found to be hurtful to the lungs) till they diſappear; take the crucible off the fire, clear away the droſs from the top of the metal, pour in about one ounce of powdered roſin, with as much nitre, in order to give the metal a clean ſurface, and pour out the metal into the moulded flaſks.

The ſpeculum ſhould be moulded with the concave ſurface downwards, and many ſmall holes ſhould be made through the ſand upwards, to diſcharge the air. The moulding ſand from Highgate near London, uſed by the founders, is as good as any for caſting theſe metallic mirrors. The caſt metal ſhould be taken out from the ſand of the flaſks whilſt it is hot, or elſe it may happen to crack if left to cool within. See Telescope.

But in addition to what has now been ſaid, we muſt notice ſome other information relative to the grinding, poliſhing, and other important circumſtances connected with the method of preparing the moſt perfect ſpecula for teleſcopes. The metal being taken out of the flaſk, as already noticed, and this ſhould be done as ſoon as it has become ſolid, and while it is yet red hot, care muſt be taken to keep the face downwards to prevent it from ſinking. Holding it in that poſition by the git, force out the ſand from the hole in the middle of the mirror with a piece of wood or iron, and place the ſpeculum in an iron pot, with a large quantity of hot aſhes or ſmall coals, ſo as to bury the ſpeculum in them a ſufficient depth. If the ſand is not forced out of the hole in the manner above directed, the metal, by ſinking as it cools, will

Speculum. will embrace the sand in the middle of the speculum so tight, as to cause it to crack before it becomes entirely cold. And if the metal be not taken out of the sand, and put in a pot with hot ashes or coals to anneal it, the moisture from the sand will always break the metal. Let the speculum remain in the ashes till the whole is become quite cold. The git may be easily taken off by marking it round with a common fine half round file, and giving it then a gentle blow. The metal is then to be rough ground and figured.

But before we proceed to describe that process, it may be proper to give an account of another composition for the speculum of a reflecting telescope, which has been employed with great success, by Rochon director of the marine observatory at Brest. Of this composition the principal ingredient is platina; which, in grains, must be purified in a strong fire by means of nitre and the salt of glass, or that flux which in the English glass-houses is called by the workmen *sandifer*. To the platina, when purified, add the eighth part of the metal employed in the composition of common specula; for tin without red copper would not produce a good effect. This mixture is then to be exposed to the most violent heat, which must be still excited by the oxygen gas that disengages itself from nitre when thrown into the fire. One melting would be insufficient: five or six are requisite to bring the mixture to perfection. It is necessary that the metal should be in a state of complete fusion at the moment when it is poured into the mould. By this process I have been enabled (says the author) to construct a telescope with platina, which magnifies the diameters of objects five hundred times, with a degree of clearness and distinctness requisite for the nicest observations. The large speculum of platina weighs fourteen pounds: it is eight inches in diameter, and its focus is six feet. Though the high price of platina will, in all probability, for ever prevent it from coming into general use for the speculums of telescopes, we thought it proper to notice this discovery, and shall now proceed to the grinding of the speculum.

For accomplishing this object, a very complicated process is recommended in Smith's Optics, and one not much more simple, by Mr Mudge in the 67th volume of the *Philosophical Transactions;* but according to Mr Edwards, whose speculums are confessedly the best, neither of these is necessary. Besides a common grindstone, all the tools that he made use of are a rough grinder, which serves also as a polisher, and a bed of hones. When the speculum was cold, he ground its surface bright on a common grindstone, previously brought to the form of the gage; and then took it to the rough grinder.

The tool is composed of a mixture of lead and tin, or of pewter, and is made of an elliptical form, of such dimensions, that the shortest diameter of the ellipse is equal to the diameter of the mirror or speculum, and the longest diameter is to the shortest in the proportion of ten to nine. This rough grinder may be fixed upon a block of wood, in order to raise it higher from the bench; and as the metal is ground upon it with fine emery, Mr Mudge, with whom, in this particular, Mr Edwards agrees, directs a hole or pit to be made in the middle of it as a lodgement for the emery, and deep grooves to be cut out across its surface with a graver for the same purpose. By means of a handle, fixed on the back of the metal with soft cement, the speculum can be whirled round upon this grinder so rapidly, that a common labourer has been known to give a piece of metal, four inches in diameter, so good a face and figure as to fit it for the hones in the space of two hours. The emery, however fine, will break up the metal very much; but that is remedied by the subsequent processes of honing and polishing.

When the metal is brought to a true figure, it must be taken to a convex tool, formed of some stones from a place called Edgedon in Shropshire, situated between Ludlow and Bishop's Castle. The common blue hones, used by many opticians for this purpose, will scarcely touch the metal of Mr Edwards's speculums; but where they must be employed for want of the others, as little water should be used as possible when the metal is put upon them; because it is found by experience that they cut better when but barely wet, than when drenched with water. The stones, however, from Edgedon are greatly preferable; for they cut the metal more easily, and having a very fine grain, they bring it to a smooth face. These stones are directed by Mr Mudge to be cemented in small pieces upon a thick round piece of marble, or of metal made of tin and lead like the former composition, in such a manner, that the lines between the stones may run straight from one side to the other; so that placing the teeth of a very fine saw in each of these divisions, they may be cleared from one end to the other of the cement which rises between the stones. As soon as the hones are cemented down, this tool must be fixed in the lathe, and turned as exactly true to the gage as possible. It should be of a circular figure, and but very little larger than the metal intended to be figured upon it. If it be made considerably larger, it will grind the metal into a larger sphere and a bad figure; and if it be made exactly of the same size, it will work the metal indeed into a figure truly spherical, but will be apt to shorten its focus, unless the metal and tool be worked alternately upwards. On these accounts, Mr Edwards recommends it to be made about one twentieth part longer in diameter than the speculum, because he has found that it does not then alter its focus; and he earnestly dissuades the use of much water on the hone pavement at the time of using it, otherwise, he says, that the metal in different parts of it will be of different degrees of brightness.

The metal being brought to a very fine face and figure by the bed of stones, is ready to receive a polish, which is given to it by the elliptical rough grinder covered with pitch. With respect to the consistency of this pitch, Mr Mudge and Mr Edwards give very different directions. Whilst the former says that it should be neither too hard nor too soft, the latter affirms that the harder the pitch is, the better figure it will give to the metal. Pitch may be easily made of a sufficient hardness by adding a proper quantity of rosin; and when it is hardened in this way, it is not so brittle as pitch alone, which is hardened by boiling. Mr Edwards advises to make the mixture just so hard as to receive, when cold, an impression from a moderate pressure of the nail of one's finger. When the elliptical tool is to be covered with this mixture, it must be made pretty warm, and in that state have the mixture poured upon it when beginning to cool in the crucible. Our author

Speculum. author recommends this coating to be made everywhere of about the thicknefs of half a crown; and to give it the proper form, it muft, when fomewhat cool, be preffed upon the face of the mirror, which has firft been dipped in cold water, or covered over with very fine writing paper. If it be not found to have taken the exact figure from the firft preffure, the furface of the pitch muft be gently warmed, and the operation repeated as before. All the fuperfluous pitch is now to be taken away from the edge of the polifher with a pen knife, and a hole to be made in the middle, accurately round, with a conical piece of wood. This hole fhould go quite through the tool, and fhould be made of the fame fize, or fomewhat lefs than the hole in the middle of the fpeculum. Mr Edwards fays, that he has always found that fmall mirrors, though without any hole in the middle, polifh much better, and take a more correct figure, for the polifher's having a hole in the middle of it.

The polifher being thus formed, it muft be very gently warmed at the fire, and divided into feveral fquares by the edge of a knife. Thefe, by receiving the fmall portion of metal that works off in polifhing, will caufe the figure of the fpeculum to be more correct than if no fuch fquares had been made. Mr Mudge directs the polifher to be ftrewed over with very fine *putty*; but Mr Edwards prefers COLCOTHAR of vitriol. Putty (fays he) gives to metals a white luftre, or, as workmen call it, a filver hue; but good colcothar of vitriol will polifh with a very fine and high black luftre, fo as to give the metal finifhed with it the complexion of polifhed fteel. To know if the colcothar of vitriol is good, put fome of it into your mouth, and if you find it diffolves away it is good; but if you find it hard, and crunch between your teeth, then it is bad, and not well burned. Good colcothar of vitriol is of a deep red, or of a deep purple colour, and is foft and oily when rubbed between the fingers; bad colcothar of vitriol is of a light red colour, and feels harfh and gritty. The colcothar of vitriol fhould be levigated between two furfaces of polifhed fteel, and wrought with a little water; when it is worked dry, you may add a little more water, to carry it lower down to what degree you pleafe. When the colcothar of vitriol has been wrought dry three or four times, it will acquire a black colour, and will be low enough, or fufficiently fine, to give an exquifite luftre. This levigated colcothar of vitriol muft be put into a fmall phial, and kept with fome water upon it. When it is to be ufed, every part of the pitch-polifher muft be firft brufhed over with a fine camel's hair brufh, which has been dipped in pure water, and rubbed gently over a piece of dry clean foap. The wafhed colcothar of vitriol is then to be put upon the polifher; and Mr Edwards directs a large quantity of it to be put on at once, fo as to faturate the pitch, and form a fine coating. If a fecond or third application of this powder be found neceffary, it muft be ufed very fparingly, or the polifh will be deftroyed which has been already attained. When the metal is nearly polifhed, there will always appear fome black mud upon its furface, as well as upon the tool. Part of this muft be wiped away with fome very foft wafh leather; but if the whole of it be taken away, the polifhing will not be fo well completed.

With refpect to the *parabolic figure* to be given to the mirror, Mr Edwards affures us, that a very little experience in thefe matters will enable any one to give it with certainty, by polifhing the fpeculum in the common manner, only with crofs ftrokes in every direction, upon an elliptical tool of the proper dimenfions. Speculum ‖ Speech.

SPECULUM, a looking glafs or mirror, capable of reflecting the rays of the fun.

SPECULUM, in *Surgery*, an inftrument for dilating a wound, or the like, in order to examine it attentively. See SURGERY.

SPEECH, in general, the art or act of expreffing a perfon's thoughts by means of articulate founds, which we call words. See LANGUAGE, GRAMMAR, READING, and ORATORY, Part IV.

SPEED, JOHN, an Englifh hiftorian, was born at Farington, in Chefhire, in the year 1542. He was by profeffion a taylor, and freeman of the company of merchant taylors in the city of London. In 16 6, he publifhed his Theatre of Great Britain, which was afterwards reprinted in folio, under the title of the *Theatre of the Empire of Great Britain*. His Genealogies of Scripture were firft bound up with the Bible in 1611, when the firft edition of the prefent tranflation was printed. In 1614 appeared his *Hiftory of Great Britain*, which has been tranflated into Latin; and in 1616 he publifhed his *Cloud of Witneffes*, in octavo. He lived in marriage 57 years with his wife, by whom he had twelve fons and fix daughters; and died in 1629. He was interred in the church of St Giles's, Cripplegate, London, where a monument was erected to his memory.

SPEEDWELL. See VERONICA, BOTANY *Index*.

SPELL, a charm confifting of fome words of occult power, generally attended with fome ceremony.—In order to explain it, we will produce a few examples. On St Agnes's night, 21ft of January, take a row of pins, and pull out every one, one after another, faying a Pater-nofter on fticking a pin in your fleeve, and you will dream of him or her you fhall marry.

Another method to fee a future fpoufe in a dream. The party inquiring muft lie in a different county from that in which he commonly refides, and on going to bed muft knit the left garter about the right-legged ftocking, letting the other garter and ftocking alone; and as he rehearfes the following verfes, at every comma knit a knot: *Grofe's Provincial Gloffary.*

This knot I knit,
To know the thing I know not yet;
That I may fee
The man (woman) that fhall my hufband (wife) be;
How he goes, and what he wears,
And what he does all days and years.

Accordingly, in a dream, he will appear with the infignia of his trade or profeffion.

Another, performed by charming the moon, thus: At the firft appearance of the new moon, immediately after the new year's day, (though fome fay any other new moon is as good), go out in the evening, and ftand over the fpars of a gate or ftile, and, looking on the moon, repeat the following lines:

All hail to the moon! all hail to thee!
I prithee, good moon, reveal to me
This night who my hufband (wife) muft be.

 Immediately

Immediately after you must go to bed, when you will dream of the person destined for your future husband or wife.

SPELLING, in *Grammar*, that part of orthography which teaches the true manner of resolving words into their syllables.

All words are either simple or compound, as *use*, *disuse*; *done*, *undone*; and the rules for dividing each must be such as are derived from the analogy of language in general, or from the established custom of speaking; which, for the English language, are reduced to the following rules: 1. A consonant between two vowels must be joined with the latter in spelling, as *na-ture*, *ve-ri-ly*, *ge-ne-rous*; except, however, the letter *x*, which is joined to the first, as in *flax-en*, *ox-en*, &c. and compound words, as in *up-on*, *un-used*, &c. 2. A double consonant must be divided, as in *let-ter*, *man-ner*, &c. 3. Those consonants which can begin a word must not be parted in spelling, as in *de-fraud*, *re-prove*, *di-stinct*; however, this rule is found sometimes to fail; for though *gn* begins a word, as *gnaw*, *gnat*, &c. yet it must be divided in spelling, as in *cog-ni-zance*, *ma-lig-ni-ty*, &c. 4. Those consonants which cannot begin a word must be divided, as *ld* in *seldom*, *lt* in *mul-ti-tude*, *mp* in *temper*, *rd* in *ar-dent*; but in final syllables there are exceptions, as *tl* in *ti-tle*, *dl* in *han-dle*, &c. 5. When two vowels come together, and are both of them distinctly sounded, they must be separated in spelling, as in *co-e-val*, *mu-tu-al*, &c. 6. The grammatical terminations or endings must be separated in spelling, as *ed* in *wing-ed*, *edst* in *de-li-ver-edst*, *ing* in *hear-ing*, *ance* in *de-li-ver-ance*, &c. 7. Compound words must be resolved into their simple or component words, as *up-on*, *in-to*, *ne-ver-the-less*, *not-with-stand-ing*, &c.

SPELMAN, Sir Henry, an eminent English antiquarian, was descended from an ancient family, and born at Congham, near Lynn in Norfolk, about the year 1561. He was knighted by King James I. who had a particular esteem for him on account of his known capacity for business; and he employed him several times in Ireland on public affairs. When he was about 50 years of age, he went to reside in London; where falling into a study to which his own genius had always inclined him, he collected all such books and MSS. as concerned the subject of antiquities, either foreign or domestic. In 1626, he published the first part of his well-known Glossary, which he never carried beyond the letter L; because, as some have suggested, he had said things under "Magna charta," and "Maximum consilium," that could not then have appeared without giving offence. Upon his death all his papers came into the hands of his son Sir John Spelman, a gentleman who had abilities to have completed his father's design, if death had not prevented him. The second part was afterwards published by Sir William Dugdale; but with all the marks of a scanty unfinished performance. The next work he entered upon was an edition of the English Councils, of which he published the first volume about two years before his death, leaving the second volume, as well of this as of his Glossary, to be published by Sir William Dugdale. Sir Henry wrote several other things, all relating to ancient laws and customs, and died in 1641. His Posthumous Works were published in folio, 1698, under the inspection of Mr Gibson, afterwards bishop of London.

SPELTER, in *Metallurgy*, the same with Zinc.

SPENCE, Joseph, an eminent writer, was fellow of New College, Oxford, where he took the degree of A.M. in 1727. About that time he became first known as an author, by an *Essay on Pope's Odyssey, in which some particular beauties and blemishes of that work are considered*; a work of great merit, and which for sound criticism and candid disquisition is almost without a parallel. He was elected professor of poetry by the university in 1728, and held that office ten years, which is as long as the statutes will allow. His History of Stephen Duck was first published in 1731; but it was afterwards much altered, and prefixed to an edition of Duck's poems.

About this time he travelled into Italy as tutor to the earl of Lincoln, afterwards duke of Newcastle.—In 1736 he republished Gorboduc, at Mr Pope's desire, with a preface giving an account of the author, the earl of Dorset. He quitted his fellowship in 1742, upon being presented by the Society of New College to the rectory of Great Harwood in Buckinghamshire.—He never resided in his living; but paid it an annual visit, distributing large sums of money among the poor, and providing for many of their children. The same year he was made professor of modern history at Oxford. In 1747 he published *Polymetis*; or an inquiry concerning the agreement between the works of the Roman poets and the remains of ancient artists, being an attempt to illustrate them mutually from each other. This work was treated by Gray with a contempt which it did not deserve. He raises objections because the author did not illustrate his subject from Greek writers; that is, because he failed to execute what he never undertook. He was installed prebendary of the seventh stall at Durham the 24th May 1754. He published the same year, "An Account of the Life, Character, and Poems, of Mr Blacklock, student of philosophy at Edinburgh;" which was afterwards prefixed to his Poems. The prose pieces which he printed in the Museum he collected and published, together with some others, in a pamphlet called *Moralities*, by Sir Harry Beaumont. Under the same name he published "Crito, or a Dialogue on Beauty," and "A particular Account of the emperor of China's Gardens near Pekin, in a letter from F. Attiret, a French missionary now employed by that emperor to paint the apartments in those gardens, to his friend at Paris." Both these treatises are printed in Dodsley's fugitive pieces, as is also "A Letter from a Swiss Officer to his friend at Rome;" which Mr Spence first published in the Museum. In 1758 he published "A Parallel, in the Manner of Plutarch, between a most celebrated man of Florence and one scarce ever heard of in England." This was also inserted in the fugitive pieces. The same year he made a journey into Scotland, which he described in an affectionate letter to Mr Shenstone, published in Hall's Collection of Letters, 1778. In 1764 he was very well described by Mr James Ridley, in his admirable Tales of the Genii, under the name of *Phesoi Ecneps* (his name read backwards), dervise of the groves. A letter from Mr Spence to that ingenious moralist, under the same signature, is preserved in the 3d volume of "Letters

ters of Eminent Perfons." In 1768 he publifhed "Remarks and Differtations on Virgil, with fome other claffical obfervations, by the late Mr Holdfworth." On the 20th of Auguft the fame year he was unfortunately drowned in a canal in his garden at Bytleet in Surrey. He was found flat upon his face at the edge of the canal, where the water was fo fhallow as not even to cover his head. The accident, it was fuppofed, for he was quite alone, was owing to a fit.

The duke of Newcaftle poffeffes fome manufcript volumes of anecdotes collected by Mr Spence, from which Dr Johnfon was permitted to infert many extracts in his Lives of the Poets.

SPENCER, Dr John, an eminent divine, was born in Kent in 1630, and educated at Cambridge. He was chofen fellow of his college, and took a doctor's degree in 1663. In 1667 he was chofen mafter of Corpus Chrifti College, and preferred to the deanery of Ely in 1677. He died on the 20th of May 1695. His works are, 1. The Righteous Ruler; a fermon on Proverbs xxix. 2. preached June 28. 1660. 2. A Difcourfe concerning Prodigies, wherein the vanity of prefages by them is reprehended, and their true and proper ends afferted and vindicated. To this excellent work was afterwards added, A Difcourfe concerning vulgar prophecies, wherein the vanity of receiving them as the certain indications of any future event is expofed; and fome marks of diftinction between true and pretended prophets are laid down. 3. A Latin Differtation concerning Urim and Thummim. 4. His famous treatife *De legibus Hebræorum ritualibus et earum rationibus*. The intention of this book, as he informs us himfelf, was to vindicate the Deity from the imputation of acting from arbitrary and fantaftical motives. It has been highly and juftly efteemed both for the elegance of ftyle and the uncommon erudition and found fenfe which it difplays. It has, however, (that part of it particularly which endeavours to deduce fome of the Jewifh ceremonies from the practices of their heathen neighbours), alarmed many perfons, as if fuch a doctrine, if it could be proved, would derogate from the Divine wifdom, and undermine revelation. But this is fo far from being the cafe, that Dr Spencer's attempt, whether fuccefsful or not, deferves the gratitude of Chriftians, becaufe it has a tendency to throw light on an important and difficult fubject.

SPENSER, Edmund, the poet, was born in London in the year 1553, and defcended from an ancient family of the Spenfers in Northamptonfhire. All we know concerning his education is, that he was admitted a fizer of Pembroke-hall in Cambridge, and matriculated in 1569. At this time began his intimacy with Mr Gabriel Harvey, a man of genius and a poet. In 1576, having completed his degrees in arts, he left the univerfity, as it is conjectured, for want of fubfiftence, and retired to the north of England. Here he had the misfortune to become enamoured of his Rofalind, who, after flattering his paffion for a time, at length preferred his happier rival. Spenfer continued in the country till the year 1578, when at the perfuafion of his friend Mr Harvey he removed to London, where that gentleman introduced him to Mr Sidney (afterwards Sir Philip Sidney). Concerning his firft introduction to Sir Philip, there is indeed a different ftory, which was firft told by the writer of his life, prefixed to his works in 1679, and tranfcribed by Hughes, Cibber, and feveral others; which, neverthelefs, is certainly not true. The purport of it is, that Spenfer, being unknown to this Mecænas of the age, went to Leicefter-houfe, and fent in the 9th canto of the firft book of the Fairy Queen; that, on reading part of it, Sir Philip ordered his fteward to give the bearer 50l.; on reading a little farther 50l. more; then 200l. bidding him to make hafte and pay the money, left he fhould give the poet his whole eftate. The ftory tells prettily enough; but it is very certain, that the Fairy Queen was begun long after his acquaintance with Sir Philip. By this univerfal patron of genius, however, he was prefented to Queen Elizabeth, who honoured him with the place of poet-laureat. About this time he finifhed his Shepherd's Calendar, which was firft printed in 1579; and in the following year, being recommended by his patron to the earl of Leicefter, he went to Ireland as fecretary to the lord Grey of Wilton, then appointed lord-lieutenant of that kingdom. Lord Grey was recalled in 1582, and with him Spenfer returned to London, where he continued till after the death of Sir Philip Sidney in 1586; a lofs which he bewailed to the end of his life. The following year, our poet, having obtained a royal grant of 3000 acres of forfeited lands in the county of Cork in Ireland, fet out for that kingdom, took poffeffion of his eftate, and fixed his refidence in the caftle of Kilcolman, which had belonged to the earl of Defmond. In this retirement he refumed his great work of the Fairy Queen; and continued in Ireland till, being vifited by his old friend Sir Walter Raleigh in 1589, he came over with him to England, but returned to Ireland the year following, where he fell in love with a country girl, and married her. Soon after his marriage, he paid another vifit to his native country, where we alfo find him in 1596. In the following year he returned once more to Kilcolman; but on the rebellion of Lord Tyrone, who ravaged the whole county of Cork, he was obliged to fly for fafety with his family to England, where, in the year 1599, he died in extreme poverty (A). He was buried in Weftminfter Abbey, according to his requeft, near Chaucer. A monument was erected to his memory by Ann countefs of Dorfet. We know but little of his character as a man; as a poet, confidering the age in which he lived, he deferves our utmoft veneration. He wrote various pieces befides thofe above mentioned. His whole works, with his life by Hughes, were publifhed in fix volumes 12mo, in 1715 and 1750.

SPERGULA, Spurrey, a genus of plants belonging to the clafs of decandria; and in the natural fyftem arranged

(A) This is Camden's account, and it has been generally believed; but Mr Malone, the laft editor of Shakefpeare's works, by examining the patent roll, 33 Eliz. p. 3. has difcovered, that in February 1690-1 Spenfer obtained from Queen Elizabeth an annuity or penfion of 50l. during his life; a fum equivalent to 200l. at prefent.

arranged under the 22d order, *caryophylleæ*. See BOTANY *Index*.

SPERM, the feed whereof an animal is formed. See PHYSIOLOGY.

SPERMACETI, a whitifh, unctuous, flaky fubftance, prepared from oil, but chiefly from the brains of a fpecies of whale called *phyfeter macrocephalus*.

The method of preparing fpermaceti is kept a fecret; but the procefs is faid to be this: The brains being taken out of the animal, are then, as fome fay, melted over a gentle fire, poured into moulds, and when cold melted again; and this procefs is continued till they are purified. Others fay, that after being preffed and drained they are more thoroughly purified by fteeping them in a ley of alkaline falt and quicklime. The brains are then wafhed, and cut into thin flakes or flices with wooken knives. One fifh is faid to afford fome tons of brains. Good fpermaceti is gloffy and femitranfparent, in fine white flakes; foft and unctuous to the touch, yet dry and friable; in tafte, fomewhat like butter, and of a faint fmell like that of tallow. Some adulterate it with wax; but the deceit is difcovered, either by the fmell of the wax or by the dulnefs of the colour. Some alfo fell a preparation of oil taken from the tail of the whale inftead of that from the brain; but this kind turns yellow as foon as expofed to the air. Indeed it is apt in general to grow yellowifh, and to contract a rancid fifhy fmell if not carefully fecured from the air. The more perfectly it has been purified at firft, the lefs fufceptible it is of thefe alterations; and after it has been changed, it may be rendered white and fweet again by fteeping it afrefh in a ley of alkaline falt and quicklime. It melts in a fmall degree of heat, and congeals again as it cools.

Spermaceti is of ufe in medicine. Quincy fays it is a noble remedy in the afthma, &c. though chiefly ufed in bruifes, inward hurts, and after delivery. For internal ufe, it may be diffolved in aqueous liquors into the form of an emulfion, by trituration with almonds, the yolk or white of an egg, and more elegantly by mucilages; or made into a lohoch, by mixing two drams of it with a fuitable quantity of yolk of egg, then adding half an ounce of frefh drawn oil of almonds, and an ounce of balfamic fyrup. Spermaceti is not capable of being diffolved by cauftic alkalies, and of forming foaps, like other oily matters: but it is altogether foluble in oils, and unites by liquefaction with wax and refins; and in thefe forms is applied externally. But it is certain, its greateft property, and that which makes it fo much in vogue in many places, is its foftening the fkin. Whence it comes to be ufed by the ladies in paftes, wafhes, &c.

Spermaceti candles are of modern manufacture: they are made fmooth, with a fine glofs, free from rings and fcars, fuperior to the fineft wax candles in colour and luftre; and, when genuine, leave no fpot or ftain on the fineft filk, cloth, or linen.

A method has been lately propofed by Dr Smith Gibbes of Briftol, to convert animal mufcle into a fubftance much refembling fpermaceti. The procefs is remarkably fimple: Nothing more is neceffary than to take a dead carcafe and expofe it to a ftream of running water: it will in a fhort time be changed to a mafs of fatty matter. To remove the offenfive fmell, a quantity

Phil. Tranf. 1794.

of nitrous acid may then be poured upon it, which uniting with the fetid matter, the fat is feparated in a pure ftate. This acid indeed turns it yellow, but it may be rendered white and pure by the action of the oxygenated muriatic acid. Mr Gibbes brought about the fame change in a much fhorter time. He took three lean pieces of mutton and poured on them the three mineral acids, and he perceived that at the end of three days each was much altered; that in the nitrous acid was much foftened, and on feparating the acid from it, he found it to be exactly the fame with that which he had before got from the water; that in the muriatic acid was not in that time fo much altered; the vitriolic acid had turned the other black.

SPERMACOCE, BUTTON-WOOD, a genus of plants belonging to the clafs of tetrandria; and in the natural fyftem arranged under the 47th order, *ftellatæ*. See BOTANY *Index*.

SPERMATIC, in *Anatomy*, fomething belonging to the fperm or feed.

SPEUSIPPUS, an Athenian philofopher, the nephew and fucceffor of Plato. Contrary to the practice of Plato, Speufippus required from his pupils a ftated gratuity. He placed ftatues of the Graces in the fchool which Plato had built. On account of his infirm ftate of health, he was commonly carried to and from the academy in a vehicle. On his way thither he one day met Diogenes, and faluted him; the furly philofopher refufed to return the falute, and told him, that fuch a feeble wretch ought to be afhamed to live; to which Speufippus replied, that he lived not in his limbs, but in his mind. At length, being wholly incapacitated, by a paralytic ftroke, for the duties of the chair, he refigned it to Xenocrates. He is faid to have been of a violent temper, fond of pleafure, and exceedingly avaricious. Speufippus wrote many philofophical works, which are now loft, but which Ariftotle thought fufficiently valuable to purchafe at the expence of three talents. From the few fragments which remain of his philofophy, it appears that he adhered very ftrictly to the doctrine of his mafter.

SPEY, a river of Scotland, rifing from a lake of the fame name in Badenoch, and, after a ferpentine courfe of 76 miles, paffes by Rothes caftle, and falls into the German fea at Garnoch near Elgin. Mr Pennant tells us, that the Spey is a dangerous neighbour to Caftle Gordon, overflowing frequently in a dreadful manner, as appears by its ravages far beyond its banks. The bed of the river is wide and full of gravel, and the channel very fhifting. In 1746 the duke of Cumberland paffed this river at Belly church, near Caftle Gordon, when the channel was fo deep as to take an officer, from whom Mr Pennant had the account, and who was fix feet four inches high, up to the breaft. The banks are here very high and fteep; fo that had not the rebels been infatuated in fuch a manner as to neglect oppofition, the paffage muft have been attended with confiderable lofs. On this river there is a great falmon-fifhery; about 1700 barrels full are caught in the feafon, and the fhore was formerly rented for about 1200l. per annum: now it is probably doubled.

SPHACELUS, in *Surgery* and *Medicine*, an abfolute and perfect corruption or death of the parts.

SPHÆRANTHUS, a genus of plants belonging to the

the clafs of fyngenefia, and to the order of polygamia fegregata; and in the natural fyftem arranged under the 49th order, *Compofitæ*. See BOTANY *Index*.

SPHAGNUM, BOG-MOSS, a genus of plants belonging to the clafs of cryptogamia and order of mufci. See BOTANY *Index*.

Os SPHENOIDES, the feventh bone of the cranium or fkull. See ANATOMY, N° 11.

SPHERE, is a folid contained under one uniform round furface, every point of which is equally diftant from a certain point in the middle called its *centre*; and is formed by the revolution of a femicircle about its diameter. See GEOMETRY.

Projection of the SPHERE. See PROJECTION.

SPHERE, in *Aftronomy*, that concave orb or expanfe which invefts our globe, and in which the heavenly bodies appear to be fixed, and at an equal diftance from the eye.

The better to determine the places of the heavenly bodies in the fphere, feveral circles are fuppofed to be defcribed on the furface thereof, hence called the *circles of the fphere*: of thefe fome are called *great circles*, as the equinoctial, ecliptic, meridian, &c. and others *fmall circles*, as the tropics, parallels, &c. See GEOGRAPHY; and ASTRONOMY, *paffim*.

Armillary SPHERE. See GEOGRAPHY.

SPHERE of Activity of a Body, is that determinate fpace or extent to which, and no farther, the effluvia continually emitted from that body reach; and where they operate according to their nature.

SPHERES, in *Optics*, the fame with metalline mirrors, for telefcopes or other purpofes. See MIRROR.

SPHEROID, in *Geometry*, a folid approaching to the figure of a fphere. It is generated by the entire revolution of a femi-ellipfis about its axis. When the revolution is made round the largeft axis, the fpheroid is called *prolate*; and when round the fhorteft, *oblate*. This laft is the figure of the earth, and probably of all the planets.

SPHEX, ICHNEUMON WASP, or *Savage*; a genus of infects belonging to the order of *hymenopteræ*. See ENTOMOLOGY *Index*.

SPHINCTER, in *Anatomy*, a term applied to a kind of circular mufcles, or mufcles in form of rings, which ferve to clofe and draw up feveral orifices of the body, and prevent the excretion of the contents.

SPHINX, in fabulous hiftory, a monfter which had the head and breafts of a woman, the body of a dog, the tail of a ferpent, the wings of a bird, the paws of a lion, and a human voice. It fprang from the union of Orthos with the Chimæra, or of Typhon with Echidna. The Sphinx had been fent into the neighbourhood of Thebes by Juno, who wifhed to punifh the family of Cadmus, which fhe perfecuted with immortal hatred, and it laid this part of Bœotia under continual alarms, by propofing enigmas, and devouring the inhabitants if unable to explain them. In the midft of their confternation the Thebans were told by the oracle, that the fphinx would deftroy herfelf as foon as one of the enigmas fhe propofed was explained. In this enigma fhe wifhed to know what animal walked on four legs in the morning, two at noon, and three in the evening. Upon this Creon king of Thebes promifed his crown and his fifter Jocafta in marriage to him who could deliver his country from the monfter by a fuccefsful explanation of the enigma. It was at laft happily explained by Oedipus, who obferved, that man walked on his hands and feet when young, or in the morning of life; at the noon of life he walked erect; and in the evening of his days he fupported his infirmities upon a ftick. (*Vid. Oedipus*). The fphinx no fooner hear this explanation than fhe dafhed her head againft a rock, and immediately expired. Some mythologifts wifh to unriddle the fabulous traditions about the fphinx by the fuppofition that one of the daughters of Cadmus, or Laius, infefted the country of Thebes by her continual depredations, becaufe fhe had been refufed a part of her father's poffeffions. The lion's paw expreffed, as they obferve, her cruelty, the body of the dog her lafcivioufnefs, her enigmas the fnares fhe laid for ftrangers and travellers, and her wings the difpatch fhe ufed in her expeditions.

Lempriere's Bibliotheca Claffica.

Among the Egyptians the fphinx was the fymbol of religion, by reafon of the obfcurity of its myfteries; and on the fame account the Romans placed a fphinx in the pronaos or porch of their temples. Sphinxes were ufed by the Egyptians to fhow the beginning of the water's rifing in the Nile: with this view, as it had the head of a woman and body of a lion, it fignified that the Nile began to fwell in the months of July and Auguft, when the fun paffes through the figns of Leo and Virgo. There are feveral of thefe ftill to be feen; one in particular, near the pyramids, much fpoken of by the ancients; being of a prodigious fize, and cut out of the rock; the head and neck appear only at prefent, the reft of the body being hid in the fand. This, according to Thevenot, is 26 feet high, and 15 feet from the ear to the chin: but Pliny affures us, the head was no lefs than 102 feet in circumference, and 62 feet high from the belly, and that the body was 143 feet long, and was thought to be the fepulchre of King Amafis.

The learned Mr Bryant * obferves, that the fphinx feems to have been originally a vaft rock of different ftrata; which, from a fhapelefs mafs, the Egyptians fafhioned into an object of beauty and veneration. The Egyptians ufed this figure in their building; from them the Greeks derived it, and afterwards improved it into an elegant ornament. It is alfo frequently ufed in modern architecture.

* *Ancient Mythology*, vol. ii. p. 532.

It is proper to obferve, that the fphinx of the Egyptians is faid in the Afiatic Refearches † to have been found in India. Colonel Pearfe was told by Murari Pandit, a man of learning among the Hindoos, that the fphinx, there called *fingh*, is to appear at the end of the world, and as foon as he is born will prey on an elephant: he is therefore figured feizing an elephant in his claws; and the elephant is made fmall, to fhow that the *fingh*, even a moment after his birth, will be very large in proportion to it. But in oppofition to this account given by Murari Pandit, the late Sir William Jones, the learned and illuftrious prefident of the Afiatic Society, was affured by feveral Brahmans, that the figure taken for a fphinx was a reprefentation of a lion feizing a young elephant. This point therefore requires farther inveftigation.

† Vol. ii. p. 334.

SPHINX, *HAWK-Moth*, a genus of infects belonging to the order of *lepidopteræ*. See ENTOMOLOGY *Index*.

SPIGELIA, WORM-GRASS, a genus of plants belonging to the clafs of pentandria; and in the natural fyftem arranged under the 47th order, *Stellatæ*. See BOTANY and MATERIA MEDICA *Index*.

SPICE, any kind of aromatic drug that has hot and pungent qualities: fuch are pepper, nutmeg, ginger, cinnamon, cloves, &c.

SPICE-Iflands, in the Eaft Indies. See BANDA, *MOLUCCA-Iflands*, and CEYLON.

SPIDER. See ARANEA, ENTOMOLOGY *Index*.

SPIDERWORT. See PHALANGIUM, } BOTANY *Index*.
SPIGNEL. See ATHAMANTA, }

SPIKE, or *Oil of SPIKE*, a name given to an effential oil diftilled from lavender, and much ufed by the varnifh-makers and the painters in enamel.

SPIKENARD. See NARDUS, BOTANY *Index*.

SPILANTHUS, a genus of plants belonging to the clafs of fyngenefia. See BOTANY *Index*.

SPINA CERVINA, an old name for rhamnus catharticus. See RHAMNUS, BOTANY *Index*.

SPINA-Ventofa, in *Surgery*, that fpecies of corruption of the bones which takes its rife in the internal parts, and by degrees enlarges the bone, and raifes it into a tumor. See SURGERY.

SPINACIA, SPINAGE, a genus of plants belonging to the clafs of diœcia; and in the natural fyftem arranged under the 12th order, *Holoraceæ*. See BOTANY *Index*; and for an account of the method of cultivating fpinage in the garden, fee GARDENING.

SPINAGE, or SPINACH. See SPINACIA.

SPINÆ, in *Botany*, thorns, rigid prickles: a fpecies of *arma*, growing on various parts of certain plants for their defence; *fpinæ ramorum arcent pecora*. On the branches we find examples in the pyrus, prunus, citrus, hippophaes, gmelina, rhamnus, lycium, &c.; on the leaves, in the aloe, agave, yucca, ilex, hippomane, theophrafta, carlina, &c.; on the calyx, in the carduus cnicus, centaurea, moluccella, galeopfis, &c.; on the fruit, in the trapa, tribulus, murex, fpinacia, agrimonia, datura, &c.

SPINAL MARROW. See ANATOMY *Index*.

SPINALIS, in *Anatomy*, the name of feveral mufcles, &c. of the fpine.

SPINDLE, in *Geometry*, a folid body generated by the revolution of fome curve line about its bafe or double ordinate; in oppofition to a conoid, which is generated by the rotation of the curve about its axis or abfcifs, perpendicular to its ordinate. The fpindle is denominated circular, elliptic, hyperbolic, or parabolic, according to the figure of its generating curve.

SPINDLE-TREE. See EUONYMUS, BOTANY *Index*.

SPINE, SPINA DORSI. See ANATOMY, N° 30.

SPINE. See SPINÆ.

SPINET, or SPINNET, a mufical inftrument ranked in the fecond or third place among harmonious inftruments. It confifts of a cheft or belly made of the moft porous and refinous wood to be found, and a table of fir glued on flips of wood called *fummers*, which bear on the fides. On the table are raifed two little prominences or bridges, wherein are placed fo many pins as there are chords or ftrings to the inftrument. It is played on by two ranges of continued keys, the former range being the order of the diatonic fcale, and that behind the order of the artificial notes or femitones. The keys are fo many flat pieces of wood, which, touched and preffed down at the end, make the other raife a jack which ftrikes and founds the ftrings by means of the end of a crow's quill, wherewith it is armed. The 30 firft ftrings are of brafs, the other more delicate ones of fteel or iron-wire; they are all ftretched over the two bridges already mentioned. The figure of the fpinet is a long fquare or parallelogram; fome call it an *harp couched*, and the harp an *inverted fpinet*. See the article HARP.

This inftrument is generally tuned by the ear, which method of the practical muficians is founded on a fuppofition that the ear is a perfect judge of an octave and a fifth. The general rule is to begin at a certain note, as C, taken towards the middle of the inftrument, and tuning all the octaves up and down, and alfo the fifths, reckoning feven femitones to each fifth, by which means the whole is tuned. Sometimes to the common or fundamental play of the fpinet is added another fimilar one in unifon, and a third in octave to the firft, to make the harmony the fuller; they are either played feparately or together by means of a ftop: thefe are called *double* or *triple fpinets*; fometimes a play of violins is added, by means of a bow, or a few wheels parallel to the keys, which prefs the ftrings and make the found laft as long as the mufician pleafes, and heighten and foften them more or lefs, as they are more or lefs preffed. The harpfichord is a kind of fpinet, only with another difpofition of the keys (fee the article HARPSICHORD). The inftrument takes its name from the fmall quill ends which touch the ftrings, refembling *fpinæ* or thorns.

SPINIFEX, a genus of plants belonging to the clafs of *polygamia*. See BOTANY *Index*.

SPINNING, in *Commerce*, the act or art of reducing filk, flax, hemp, wool, hair, or other matters, into thread. Spinning is either performed on the wheel, or with a diftaff and fpindle, or with other machines proper for the feveral kinds of working. Hemp, flax, nettle-thread, and other like vegetable matters, are to be wetted in fpinning: filks, wools, &c. are fpun dry, and do not need water; yet there is a way of fpinning or reeling filk as it comes off the cafes or balls, where hot and even boiling water is to be ufed (fee SILK). The vaft variety, and the importance of thofe branches of our manufactures, which are produced from cotton, wool, and flax, fpun into yarn, together with the cheapnefs of provifions, and the low price of labour in many foreign countries, which are our rivals in trade, have occafioned many attempts at home to render fpinning more eafy, cheap, and expeditious; for which fee *COTTON-Spinning* and *COTTON MILLS*.

To give an intelligible and accurate defcription of a cotton mill would be abundant employment for a volume. Our limits admit of nothing like this; but as we are certain that many of our readers have viewed a cotton mill with wonder, but not with intelligence, or with leifure to trace the fteps by which the wool from the bag ultimately affumes the form of a very fine thread. Bewildered by fuch a complication of machinery, all in rapid motion, very few, we imagine, are able to recollect with diftinctnefs and intelligence the effential part of the progrefs by which the form of the cotton is fo wonderfully changed. Such readers will not think a page or two mifemployed, if they are thereby able to underftand this particular, to which all the reft of the procefs is fubfervient.

We pafs over the operation of carding, by which all the

the clots and inequalities of the cotton wool are removed, and the whole is reduced to an uniform thin fleece, about 20 inches broad. This is gradually detached from the finiſhing card, and, if allowed to hang down from it, would pile up on the floor as long as the mill continues to work; but it is guided off from the card, very tenderly, in a horizontal direction, by laying its detached end over a roller, which is ſlowly turned round by the machine. Another roller lies above the fleece, preſſing it down by its weight. By this preſſure, a gentle hold is taken of the fleece, and therefore the ſlow motion of the rollers draws it gently from the card at the ſame rate as it is diſengaged by the comb; but between the card and the rollers a ſet of ſmooth pins are placed in two rows, leading from the card to the rollers, and gradually approaching each other as we approach the rollers. By theſe pins the broad fleece is hemmed in on both ſides, and gradually contracted to a thick roll; and in this ſtate paſſes between the rollers, and is compreſſed into a pretty firm flat riband, about two inches broad, which falls off from the rollers, and piles up in deep tinplate cans ſet below to receive it.

It is upon this ſtripe or riband of cotton wool that the operation of ſpinning begins. The general effect of the ſpinning proceſs is to draw out this maſſive roll, and to twiſt it as it is drawn out. But this is not to be done by the fingers, pulling out as many cotton fibres at once as are neceſſary for compoſing a thread of the intended fineneſs, and continuing this manipulation regularly acroſs the whole end of the riband, and thus, as it were, nibbling the whole of it away. The fingers muſt be directed, for this purpoſe, by an attentive eye. But in performing this by machinery, the whole riband muſt be drawn out together, and twiſted as it is drawn. This requires great art, and very delicate management. It cannot be done at once; that is, the cotton roll cannot firſt be ſtretched or drawn out to the length that is ultimately produced from a tenth of an inch of the roll, and then be twiſted. There is not coheſion enough for this purpoſe; we ſhould only break off a bit of the roll, and could make no farther uſe of it. The fibres of cotton are very little implicated among each other in the roll, becauſe the operation of carding has laid them almoſt parallel in the roll; and though compreſſed a little by its contraction from a fleece of 20 inches to a riband of only two, and afterwards compreſſed between the diſcharging rollers of the carding machine, yet they cohere ſo ſlightly, that a few fibres may be drawn out without bringing many others along with them. For theſe reaſons, the whole thickneſs and breadth of two or three inches of the riband is ſtretched to a very minute quantity, and then a very ſlight degree of twiſt is given it, viz. about three turns in the inch; ſo that it ſhall now compoſe an extremely ſoft and ſpungy cylinder, which cannot be called a thread or cord, becauſe it has ſcarcely any firmneſs, and is merely rounder and much ſlenderer than before, being ſtretched to about thrice its former length. It is now called ſlab, or roove.

Although it be ſtill extremely tender, and will not carry a weight of two ounces, it is much more coheſive than before, becauſe the twiſt given to it makes all the longitudinal fibres bind each other together, and compreſs thoſe which lie athwart; therefore it will require more force to pull a fibre from among the reſt, but ſtill not nearly enough to break it. In drawing out a ſingle fibre, others are drawn out along with it; and if we take hold of the whole aſſemblage, in two places, about an inch or two inches aſunder, we ſhall find that we may draw it to near twice its length without any riſk of its ſeparating in any intermediate part, or becoming much ſmaller in one part than another. It ſeems to yield equably over all.

Such is the ſtate of the ſlab or roove of the firſt formation. It is uſually called the *preparation;* and the operation of ſpinning is conſidered as not yet begun. This preparation is the moſt tedious, and requires more attendance and hand labour than any ſubſequent part of the proceſs. For the ſtripes or ribands from which it is made are ſo light and bulky, that a few yards only can be piled up in the cans ſet to receive them. A perſon muſt therefore attend each thread of ſlab, to join freſh ſtripes as they are expended. It is alſo the moſt important in the manufacture: for as every inch of the ſlab meets with preciſely the ſame drawing and the ſame twiſting in the ſubſequent parts of the proceſs, therefore every inequality and fault in the ſlab (indeed in the fleece as it quits the finiſhing card) will continue through the whole manufacture. The ſpinning of cotton yarn now divides into two branches. The firſt, performed by what are called *jennies*, perfectly reſembles the ancient ſpinning with the diſtaff and ſpindle; the other, called *ſpinning of twiſt*, is an imitation of the ſpinning with the fly-wheel. They differ in the ſame manner as the ſpinning with the old wool or cotton wheel differs from the ſpinning with the flax-wheel. Mr Arkwright's chief invention, the ſubſtitution of machinery for the immediate work of the human finger, is ſeen only in the manufacture of twiſt. We ſhall therefore confine our attention to this.

The reſt of the proceſs is little more than a repetition of that gone through in making the firſt ſlab or roove. It is formed on bobins. Theſe are ſet on the back part of the drawing frame; and the end of the ſlab is brought forwards toward the attending workman. As it comes forward, it is ſtretched or drawn to about four-thirds of its former length, or lengthened one-third; and is then twiſted about twice as much as before, and in this ſtate wound up on another bobin. In ſome mills two rooves, after having been properly drawn, are brought together through one hole, and twiſted into one; but we believe that, in the greater number of mills, this is deferred to the ſecond drawing. It is only after the firſt drawing that the produce of the operation gets the name of *ſlab;* before this it is called *preparation*, or *roove*, or by ſome other name. The ſlab is is ſtill a very feeble, ſoft, and delicate yarn, and will not carry much more weight than it did before in the form of roove. The perfection of the ultimate thread or yarn depends on this extreme ſoftneſs; for it is this only which makes it ſuſceptible of an equable ſtretching; all the fibres yielding and ſeparating alike.

The next operation is the *ſecond drawing*, which no way differs from the firſt, except in the different proportionings of the lengthening, and the proportion between the lengthening and the ſubſequent twiſt. On theſe points we cannot give any very diſtinct information. It is different in different mills, and with different ſpecies of cotton wool, as may be eaſily imagined. The immediate mechaniſm or manipulation muſt be ſkilfully accommodated to the nature of that friction which

which the fibres of cotton exert on each other, enabling one of them to pull others along with it. This is greatly aided by the contorted curled form of a cotton fibre, and a confiderable degree of elafticity which it poffeffes. In this refpect it greatly refembles woollen fibres, and differs exceedingly from thofe of flax: and it is for this reafon that it is fcarcely poffible to fpin flax in this way: its fibres become lank, and take any fhape by the flighteft compreffion, efpecially when damp in the flighteft degree. But befides this, the furface of a cotton fibre has a harfhnefs or roughnefs, which greatly augments their mutual friction. This is probably the reafon why it is fo unfit for tents and other dreffings for wounds, and is refufed by the furgeon even in the meaneft hofpitals. But this harfhnefs and its elafticity fit it admirably for the manufacture of yarn. Even the fhortnefs of the fibre is favourable; and the manufacture would hardly be poffible if the fibre were thrice as long as it generally is. If it be juft fo long that in the finifhed thread a fibre will rather break than come out from among the reft, it is plain that no additional length can make the yarn any ftronger with the fame degree of compreffion by twining. A longer fibre will indeed give the fame firmnefs of adherence with a fmaller compreffion. This would be an advantage in any other yarn; but in cotton yarn the compreffion is already as flight as can be allowed; were it lefs, it would become woolly and rough by the fmalleft ufage, and is already too much difpofed to teazle out. It can hardly be ufed as fewing thread. Now fuppofe the fibres much longer; fome of them may chance to be ftretched along the flab through their whole length. If the flab is pulled in oppofite directions, by pinching it at each end of fuch fibres, it is plain that it will not ftretch till this fibre be broken or drawn out; and that while it is in its extended ftate, it is acting on the other fibres in a very unequal manner, according to their pofitions, and renders the whole apt to feparate more irregularly. This is one great obftacle to the fpinning of flax by fimilar machinery; and it has hitherto prevented (we believe) the working up of any thing but the *fhorts* or tow, which is feparated from the long fine flax in the operation of hatcheling.

A third, and fometimes even a fourth, drawing is given to the flab formed on the bobins of this fecond operation. The flab produced is now a flender, but ftill extremely foft cord, fufceptible of confiderable extenfion, without rifk of feparation, and without the fmalleft chance of breaking a fingle fibre in the attempt. In one or more of the preparatory drawings now defcribed, two, and fometimes three flabs, of a former drawing, are united before the twift is given them. The practice is different in different mills. It is plain, that unlefs great care be taken to preferve the flab extremely foft and compreffible during the whole procefs, the fubfequent drawing becomes more precarious, and we run a rifk of at laft making a bad loofe thread inftead of a uniform and fimple yarn. Such a thread will have very little lateral connection, and will not bear much handling without feparating into ftrands. The perfection of the yarn depends on having the laft flab as free of all appearance of ftrands as poffible.

The laft operation is the fpinning this flab. This hardly differs from the foregoing drawings in any thing but the twift that is given it after the laft ftretching in its length. This is much greater than any of the preceding, being intended to give the yarn hardnefs and firmnefs, fo that it will now break rather than ftretch any more.

The reader, moderately acquainted with mechanics, cannot but perceive that each of the operations now defcribed, by which the roove is changed into the foft flab, and each of thefe into one flenderer and fomewhat firmer, by alternately teazling out and twining the foft cord, is a fubftitute for a fingle pull of the finger and thumb of the fpinfter, which fhe accommodates precifely to the peculiar condition of the lock of wool which fhe touches at the moment. She can follow this through all its irregularities; and perhaps no two fucceeding plucks are alike. But when we cannot give this momentary attention to every minute portion, we muft be careful to introduce the roove in a ftate of perfect uniformity; and then every inch being treated in the fame manner, the final refult will be equable—the yarn will be uniform.

We are now to defcribe the mechanifm by which all this is effected. But we do not mean to defcribe a cotton mill; we only mean to defcribe what comes into immediate contact with the thread; and in fo doing, to confine ourfelves to what is neceffary for making the reader perceive its ability to perform the required tafk. We fee many cafes where individuals can apply this knowledge to ufeful purpofes. More than this would, we think, be improper, in a national point of view.

Let ABC reprefent the fection of a roller, whofe pivot D does not turn in a pivot hole, but in the bottom of a long narrow notch DE, cut in an iron ftandard. *abc* is the fection of another iron roller, whofe pivot *d* is in the fame notches at each end, while the roller itfelf lies or refts on the roller ABC below it. The furfaces of thefe rollers are fluted lengthwife like a column; only the flutings are very fmall and fharp, like deep ftrokes of engraving very clofe together. It is plain, that if the roller ABC be made to turn flowly round its axis by machinery, in the direction ABC (as expreffed by the dart), the roughnefs of the flutings will take hold of the fimilar roughnefs of the upper roller *abc*, and carry it round alfo in the direction of the dart, while its pivots are engaged in the notches DE, which they cannot quit. If therefore we introduce the end F of the cotton ftring or riband, formed by the carding machine, it will be pulled in by this motion, and will be delivered out on the other fide at H, confiderably compreffed by the weight of the upper roller, which is of iron, and is alfo preffed down by a lever which refts on its pivots, or other proper places, and is loaded with a weight. There is nothing to hinder this motion of the riband thus compreffed between the rollers, and it will therefore be drawn through from the cans. The compreffed part at H would hang down, and be piled up on the floor as it is drawn through; but it is not permitted to hang down in this manner, but is brought to another pair of fharp fluted iron rollers K and L. Suppofing this pair of rollers to be of the fame diameter, and to turn round in the fame time, and in the fame direction, with the rollers ABC, *abc*; it is plain that K and L drag in the compreffed riband at I, and would deliver it on the other fide at M, ftill more compreffed. But the roller K is made (by the wheelwork) to turn round more fwiftly than

Plate CCCCXCIX

Spinning.

than ABC. The difference of velocity at the ſurface of the rollers is, however, very ſmall, ſeldom exceeding one part in 12 or 15. But the conſequence of this difference is, that the ſkein of cotton HI will be lengthened in the ſame proportion; for the upper rollers preſſing on the under ones with a conſiderable force, their ſharp flutings take good hold of the cotton between them; and ſince K and L take up the cotton faſter than ABC and *abc* deliver it out, it muſt either be forcibly pulled through between the firſt rollers, or it muſt be ſtretched a little by the fibres ſlipping among each other, or it muſt break. When the extenſion is ſo very moderate as we have juſt now ſaid, the only effect of it is merely to begin to draw the fibres (which at preſent are lying in every poſſible direction) into a more favourable poſition for the ſubſequent extenſions.

The fibres being thus drawn together into a more favourable poſition, the cotton is introduced between a third pair of rollers O, P, conſtructed in the ſame way, but ſo moved by the wheelwork that the ſurface of O moves nearly or fully twice as faſt as the ſurface of K. The roller P being alſo well loaded, they take a firm hold of the cotton, and the part between K and O is nearly or fully doubled in its length, and now requires a little twining to make it roundiſh, and to conſolidate it a little.

It is therefore led ſloping downwards into a hole or eye in the upper pivot of the firſt fly, called a *jack*. This turns round an upright axis or ſpindle; the lower end of which has a pulley on it to give it motion by means of a band or belt, which paſſes round a drum that is turned by the machinery. This jack is of a very ingenious and complicated conſtruction. It is a ſubſtitute for the fly of the common ſpinning wheel. If made preciſely in the form of that fly, the thread, being ſo very bulky and ſpongy, and unable to bear cloſe packing on the bobin, would ſwag out by the whirling of the fly, and would never coil up. The bobin therefore is made to lie horizontally; and this occaſions the complication, by the difficulty of giving it a motion round a horizontal axis, in order to coil up the twiſted roove. Mr Arkwright has accompliſhed this in a very ingenious manner; the eſſential circumſtances of which we ſhall here briefly deſcribe. A is a roller of hard wood, having its ſurface cut into ſharp flutes longitudinally. On the axis, which projects through the ſide of the general frame, there is a pulley P, connected by a band with another pulley Q, turning with the horizontal axis QR. This axis is made to turn by a contrivance which is different in every different cotton mill. The ſimpleſt of all is to place above the pulley C (which is turned by the great band of the machinery, and thus gives motion to the jack), a thin circular diſc D, looſe upon the axis, ſo as to turn round on it without obſtruction. If this diſc exceed the pulley in breadth about $\frac{1}{10}$th of an inch, the broad belt which turns the pulley will alſo turn it; but as its diameter is greater than that of the pulley, it will turn ſomewhat ſlower, and will therefore have a relative motion with reſpect to the axis QR. This can be employed, in order to give that axis a very ſlow motion, ſuch as one turn of it for 20 or 30 of the jack. This we leave to the ingenuity of the reader. The bobin B, on which the roove is to be coiled up, lies on this roller, its pivots paſſing through upright ſlits in the ſides of the general frame. It lies on A, and is moved round by it, in the ſame manner as the uppermoſt of a pair of drawing rollers lies on the under one, and receives motion from it. It is evident that the fluted ſurface of A, by turning ſlowly round, and carrying the weight of the bobin, compreſſes a little the cotton that is between them; and its flutings, being ſharp, take a ſlight hold of it, and cauſe it to turn round alſo, and thus coil up the roove, pulling it in through the hole E in the upper pivot (which reſembles the fore pivot or eye of a ſpinning wheel fly) in ſo gentle a manner as to yield whenever the motion of the bobin is too great for the ſpeed with which the cotton ſkein is diſcharged by the rollers O and P.—N. B. The axis QR below, alſo gives motion to a guide within the jack, which leads the roove gradually from one end of the bobin to the other, and back again, ſo as to coil it with regularity till the bobin is full. The whole of this internal mechaniſm of the jack is commonly ſhut up in a tin cylinder. This is particularly neceſſary when the whirling motion muſt be rapid, as in the ſecond and third drawings. If open, the jacks would meet with much reſiſtance from the air, which would load the mill with a great deal of uſeleſs work.

The reader is deſired now to return to the beginning of the proceſs, and to conſider it attentively in its different ſtages. We apprehend that the deſcription is ſufficiently perſpicuous to make him perceive the efficacy of the mechaniſm to execute all that is wanted, and prepare a ſlab that is uniform, ſoft, and ſtill very extenſible; in ſhort, fit for undergoing the laſt treatment, by which it is made a fine and firm yarn.

As this part of the proceſs differs from each of the former, merely by the degree of twiſt that is given to the yarn, and as this is given by means of a fly, not materially different from that of the ſpinning wheel for flax, we do not think it at all neceſſary to ſay any thing more about it.

The intelligent reader is ſurely ſenſible that the yarn produced in this way muſt be exceedingly uniform. The uniformity really produced even exceeds all expectation; for even although there be ſome ſmall inequalities in the carded fleece, yet if theſe are not matted clots, which the card could not equaliſe, and only conſiſt of a little more thickneſs of cotton in ſome places than in others, when ſuch a piece of the ſtripe comes to the firſt roller, it will be rather more ſtretched by the ſecond, and again by the bobin, after the firſt very ſlight twining. That this may be done with greater certainty, the weights of the firſt rooving rollers are made very ſmall, ſo that the middle part of the ſkein can be drawn through, while the outer parts remain faſt held.

It is ſaid that a pound of the fineſt Bourbon cotton has been ſpun into a yarn extending a few yards beyond 119 miles!

Theſe contrivances have in ſome parts of Scotland been applied to the ſpinning of flax.

Tranſactions of the Society for the Encouragement of Arts.

SPINNING Wheel. A very conſiderable improvement has been made by Mr Antis of Fulneck near Leeds of the common ſpinning wheel. It is well known, that hitherto much time has been loſt by ſtopping the wheel in order to ſhift the thread from one ſtaple on the flyer to another; but in Mr Antis's wheel the bobbin is made to move backwards and forwards, ſo as to prevent the neceſſity of this perpetual interruption, as well as to obviate

Plate CCCCXCIX.

viate the danger of breaking the thread and loſing the end. This is effected by the axis of the great wheel being extended through the pillar next the ſpinner, and formed into a pinion of one leaf A, which takes into a wheel B, ſeven inches diameter, having on its periphery 97 teeth; ſo that 97 revolutions of the great wheel cauſe one of the leſſer wheel. On this leſſer wheel is fixed a ring of wire *c c c;* which, being ſupported on ſix legs, ſtands obliquely to the wheel itſelf, touching it at one part, and projecting nearly three quarters of an inch at the oppoſite one: near the ſide of this wheel is an upright lever C, about 15 inches long, moving on a centre, three inches from its lower extremity, and connected at the top to a ſliding bar D; from which riſes an upright piece of braſs E, which working in the notch of a pulley drives the bobin F backward and forward, according as the oblique wire forces a pin G in or out, as the wheel moves round. To regulate and aſſiſt the alternate motion, a weight H hangs by a line to the ſliding bar, and paſſing over a pulley I riſes and falls as the bobin advances or recedes, and tends conſtantly to keep the pin in contact with the wire. It is evident, from this deſcription, that one ſtaple only is wanted to the flyer; which, being placed near the extremity K, the thread paſſing through it is by the motion of the bobin laid regularly thereon. For this invention the Society inſtituted at London for the Encouragement of Arts, &c. gave the author a premium of twenty guineas.

SPINOSUS CAULIS, in *Botany*, a ſtem covered with ſtrong woody prickles, whoſe roots are not ſuperficial, but proceeding from the body of the ſtem. When applied to a leaf, *ſpinoſum folium*, it indicates the margin running out into rigid points or prickles, *quod margine exit in acumina duriora, rigida, pungentia.*

SPINOUS, in botany. See SPINOSUS.

SPINOUS Fiſhes, ſuch as have ſome of the rays of the back fins running out into thorns or prickles, as the perch, &c.

SPINOZA, BENEDICT, was born at Amſterdam the 24th November 1632. His father was a Jew of Portugal, by profeſſion a merchant. After being taught Latin by a phyſician, he applied himſelf for many years to the ſtudy of theology, and afterwards devoted himſelf entirely to philoſophy. He began very early to be diſſatisfied with the Jewiſh religion; and as his temper was open, he did not conceal his doubts from the ſynagogue. The Jews, it is ſaid, offered to tolerate his infidelity, and even promiſed him a penſion of a thouſand dollars per annum, if he would remain in their ſociety, and continue outwardly to practiſe their ceremonies. But if this offer was really made, he rejected it, perhaps from his averſion to hypocriſy, or rather becauſe he could not endure the reſtraint which it would have impoſed. He alſo refuſed being conſtituted heir to an independent fortune, to the prejudice of the natural claimants; and he learned the art of poliſhing glaſs for ſpectacles, that he might ſubſiſt independently of every one.

He would probably have continued in the ſynagogue for ſome time longer, had it not been for an accident. As he was returning home one evening from the theatre he was ſtabbed by a Jew: the wound was ſlight; but the attempt naturally led Spinoza to conclude that the Jews had formed the deſign of aſſaſſinating him. After leaving the ſynagogue, he became a Chriſtian, and frequented the churches of the Lutherans and Calviniſts. He now devoted himſelf more than ever to his favourite philoſophical ſpeculations; and finding himſelf frequently interrupted by the viſits of his friends, he left Amſterdam, and ſettled at the Hague, where he often continued for three months together without ever ſtirring from his lodging. During his reſidence in that city, his hoſteſs, who was a Lutheran, aſked him one day if ſhe could be ſaved while ſhe continued in her religion? "Yes (replied Spinoza), provided you join to your religion a peaceable and virtuous life." From this anſwer it has been concluded that he was a Chriſtian in appearance only, while in reality he regarded all religions as indifferent. But this concluſion would be too ſevere, even if the woman had been a Mahometan. His *Tractatus Theologico-politicus*, which was publiſhed about that time, is a better proof of his inſincerity than a thouſand ſuch concluſions; for this book contains all thoſe doctrines in embryo which were afterwards unfolded in his *Opera Poſthuma*, and which are generally conſidered as a ſyſtem of atheiſm.

His fame, which had now ſpread far and wide, obliged him ſometimes to interrupt his philoſophical reveries. Learned men viſited him from all quarters. While the prince of Conde commanded the French army in Utrecht, he intreated Spinoza to viſit him; and though he was abſent when the philoſopher arrived, he returned immediately, and ſpent a conſiderable time with him in converſation. The elector Palatine offered to make Spinoza profeſſor of philoſophy at Heidelberg; which, however, he declined.

He died of a conſumption at the Hague on the 21ſt February 1677, at the age of 45. His life was a perpetual contradiction to his opinions. He was temperate, liberal, and remarkably diſintereſted; he was ſociable, affable, and friendly. His converſation was agreeable and inſtructive, and never deviated from the ſtricteſt propriety.

The only edition of the works of Spinoza that we have ſeen is in two volumes ſmall 4to; the former of which was printed at Hamburg in the year 1670, and the latter we know not where, in 1677, a few months after his death. In the *Tractatus Theologico-politicus*, already mentioned, he treats of *prophecy* and *prophets;* and of the *call of the Hebrews*, whom he affirms to have been diſtinguiſhed from other nations only by the admirable form of their government, and the fitneſs of their laws for long preſerving their political ſtate. He is likewiſe of opinion, or at leaſt pretends to be ſo, that God may, in what we call a *ſupernatural way*, have given political inſtitutes to other nations as well as to the Hebrews, who were, he ſays, at no time a peculiar people to the Supreme Lord of heaven and earth; for according to him, all hiſtory, ſacred and profane, teſtifies that every nation was bleſſed with the light of prophecy. That light indeed, if his notions of it be juſt, was of very little value. He labours to prove, that the prophets were diſtinguiſhed from other men only by their piety and virtue; that their revelations depended wholly on their imaginations and the diſpoſitions of their minds; that they were often groſsly ignorant and highly prejudiced; that the ſpeculative opinions of one prophet are ſeldom in uniſon with thoſe of another; and that their writings are valuable to us only for the excellent rules which he acknowledges they contain reſpecting the prac-

tice

Spinoza. tice of piety and virtue. He then proceeds to treat of the divine law and of miracles; and endeavours to prove that no miracle, in the proper ſenſe of the word, can have been at any time performed; becauſe every thing happens by a neceſſity of nature, the reſult of the divine decrees, which are from all eternity neceſſary themſelves. He acknowledges, that in the Scriptures, which he profeſſes to admit as true hiſtory, miracles are often mentioned; but he ſays that they were only ſingular events which the ſacred hiſtorians *imagined* to be miraculous: and he then gives ſome very extraordinary rules for interpreting the books of the Old and New Teſtaments where they treat of miracles, or appear to foretel future events. See our articles MIRACLE and PROPHECY.

Having thus diveſted the Scriptures of every thing characteriſtic of a revelation from heaven, he next calls in queſtion their authenticity. He affirms, in contradiction to the cleareſt internal evidence, that the Pentateuch and all the other hiſtorical books muſt have been written by one man; and that man, he thinks, could not have flouriſhed at a period earlier than that of Ezra. The grounds of this opinion are unworthy of the talents of Spinoza; for that he had talents is incontrovertible. His principal objection to the authenticity of the Pentateuch is, that Moſes is made to ſpeak of himſelf in the third perſon, and to talk of the Canaanites being then in the land; and becauſe he finds in his writings, as well as in the books of Joſhua, Judges, Ruth, Samuel, &c. places deſigned by names which he ſuppoſes they had not in the early ages of which theſe books contain the hiſtory, he concludes that theſe writings muſt be one compilation from ancient records made at a very late period; more eſpecially as the author often ſpeaks of things of great antiquity remaining to this day. The books of Eſther, Ezra, Nehemiah, and Chronicles, muſt have been compiled, he thinks, under the Maccabees; and he ſeems to conſider as of equal value with them the ſtory of Tobit, and the other two apocryphal treatiſes intitled the Wiſdom of Solomon and Eccleſiaſticus.

Theſe ſenſeleſs cavils, worthy only of one of thoſe modern freethinkers whoſe learning, in the opinion of Biſhop Warburton, is not ſufficient to carry them even to the confines of rational doubt, we have ſufficiently obviated in another place (ſee SCRIPTURE, N° 8—31.) Spinoza urges them againſt the other books of the Old Teſtament. The prophecies of Iſaiah, Jeremiah, Ezekiel, Daniel, Hoſea, and Jonah, are, as we have them, only fragments, he ſays, of the writings of thoſe men compiled by the Phariſees under the ſecond temple from ancient and voluminous records.

In the midſt of this dogmatical ſcepticiſm, if we may uſe ſuch a phraſe, he bears ſuch a teſtimony to the laſt chapters of the book of Daniel, as we ſhould not have looked for in the writings either of a Jew or of a Deiſt. After detailing the various hypotheſes which in his time were held reſpecting the author and the intention of the book of *Job*; in which, he ſays, MOMUS is called SATAN, he proceeds in theſe words: "Tranſeo ad Danielis librum; hic ſine dubio ex cap. 8. ipſius Danielis ſcripta continet. Undenam autem priora ſeptem capita deſcripta fuerint, neſcio *;" thus admitting the famous prophecy of the ſeventy weeks. The canon of the Old Teſtament, he ſays, was finally ſettled by rabbins of the Phariſaical ſect, who wiſhed to exclude from it the books of *Proverbs*, *Eccleſiaſtes*, and *Ezekiel*, as they had actually excluded others of equal value; but the three books in queſtion were inſerted by the influence of two of the rabbis of greater wiſdom and integrity than the reſt.

* *Tractatus*, cap. x. p. 130.

That ſo paradoxical a writer, who had been originally a Jew, and was now almoſt a Deiſt, ſhould have treated the New Teſtament with as little ceremony as the Old, will not ſurpriſe the intelligent reader. He begins his remarks, however, with affirming, that no man can peruſe the Chriſtian Scriptures, and not acknowledge the apoſtles to have been prophets; but he thinks that their mode of propheſying was altogether different from that which prevailed under the Moſaic diſpenſation; and that the gift, whatever it was, forſook them the inſtant that they left off *preaching*, as their *writings* have to him every appearance of human compoſitions. This diſtinction between Chriſtian and Jewiſh prophecy is the more wonderful, that he founds it principally on the diſſimilarity of *ſtyle* viſible in the writings of the Old and New Teſtaments; though, in his ſecond chapter, which treats of the works of the Jewiſh prophets, he ſays expreſsly, "Stylus deinde prophetiæ pro eloquentia cujuſque prophetæ variabat, prophetiæ enim Ezekielis et Amoſis non ſunt, ut illæ Eſaiæ, Nachumi, eleganti, ſed rudiore ſtylo ſcriptæ." That the Hebrew ſcholar may be convinced of the truth of this remark, he recommends to him to ſtudy diligently the writings of theſe prophets, and to conſider the occaſions on which their prophecies were uttered: "Quæ ſi omnia rectè perpendentur (ſays he) facilè oſtendant, Deum nullum habere ſtylum peculiarem dicendi, ſed tantum pro eruditione, et capacitate prophetæ eatenus eſſe elegantem, compendioſum, ſeverum, rudem, prolixum, et obſcurum." Another objection brought by Spinoza againſt the prophecies of the New Teſtament ariſes from the authors of them having been at all times maſters of themſelves. This, ſays he, was peculiarly the caſe of St Paul, who often confirms his doctrine by *reaſoning*, which the Jewiſh prophets never condeſcended to do, as it would have ſubmitted their dogmas to the examination of *private judgment*. Yet, with ſingular inconſiſtency, he affirms, that the Jewiſh prophets could not know that the impreſſions made on their imaginations proceeded from God, but by a ſign given them, which by their own *reaſon* or *judgment* they knew would never be vouchſafed to an impious or a wicked man.

After theſe very free remarks on the Scriptures of the Old and New Teſtaments, he naturally enough expreſſes a ſuſpicion, that by thoſe who conſider the Bible as the epiſtle of God ſent from heaven to men, he will be thought to have ſinned againſt the Holy Ghoſt by vilifying his dictates. This leads him to inquire in what ſenſe the Scriptures are the word of God; and he gravely determines them to be ſo only as they *actually* contribute to make men more virtuous and holy. It is not enough that they are *calculated* to improve virtue and holineſs: for ſhould the words of the languages in which they are written acquire in proceſs of time a ſignification different from what they had originally; ſhould mankind loſe all knowledge of theſe languages; or even ſhould they agree to neglect the books, whether from ignorance or from wilfulneſs—thoſe books would ceaſe

Spinoza.

to be the word of God, and become nothing better than waste paper and ink; just as the two tables, which Moses broke on observing the idolatry of his countrymen, were not the covenant between Jehovah and the Israelites, but merely two pieces of stone! The Scriptures, however, are the word of God, because they teach the true religion of which God is the author; and they have taught it in such a manner, he says, that it can never be lost or corrupted whatever become of the books of the Old and New Testaments, or of the languages in which they are written. The whole of religion, as the Scriptures themselves testify, consists in the love of God above all things, and of our neighbours as ourselves: whence it follows, that we must believe that God exists, and watcheth over all things by his providence; that he is omnipotent, and has decreed the pious to be ultimately happy, and the impious miserable; and that our final salvation depends solely on His grace or favour. These truths, with their necessary consequences, are the word of God: they are clearly taught in the Scriptures, and can never be corrupted; but every thing else in these volumes is vain, he says, and of no greater importance to us than facts related in any other ancient and authentic history.

Such are the opinions which were entertained of revelation by a man, whom a critic, writing in a Christian country, and professing to be a zealous Christian himself, has lately pronounced to have been a *chosen vessel*. For what purpose he was *chosen* it is not easy to conceive. His religion, as it appears in the *Tractatus*, is the worst kind of Deism; and his politics are such as our monthly critics are not wont to teach, and such as we trust shall never be seriously taught by any British subject. By the law of nature, he says, every man before the formation of civil government has an unquestionable right to whatever appears eligible either to his reason or to his appetites; and may get possession of it by *intreaty*, by *violence*, by *fraud*, or by *any other means* attended with less trouble to himself (*sive vi, sive dolo, sive precibus, sive quocunque demum modo facilius poterit*); and may treat as an enemy every person who shall attempt to obstruct his purpose. But when men agree to devolve this right upon others, and to constitute a political state, which both reason and appetite must persuade them to do, then are they in duty bound to obey every mandate of the government, however absurd it may be (*omnia mandata tametsi absurdissima*), as long as that government can enforce its edicts, and no longer; for, according to him, right and power are so inseparably united, that when a government loses its power, it has no longer the smallest claim to obedience. This doctrine, he says, is most *obviously* just when taught of democratical governments; but it is in fact equally true of monarchies and aristocracies: "Nam quisquis summam habet potestatem, sive unus sit, sive pauci, sive denique omnes, certum est ei summum jus *quicquid velit imperandi*, competere: et præterea quisquis potestatem se defendendi, sive sponte, sive *vi coactus*, in alium transtulit, eum suo jure naturali planè cessisse, et consequenter eidem ad omnia absolutè parere decrevisse quod omnia præstare tenetur, quamdiu rex, sive nobiles, sive populus summam, quam acceperunt, potestatem, quæ juris transferendi fundamentum fuit, conservant; nec his plura addere opus est *." We heartily agree with him, that to this precious conclusion it is needless to add a single word.

* *Tractatus*, cap. xvi. p. 18.

Taking our leave therefore of his *Tractatus Theologico-politicus*, we shall now give our readers a short account of his *Opera Posthuma*. These consist of, 1. ETHICA, *more geometrico demonstrata*; 2. POLITICA; 3. DE EMENDATIONE INTELLECTUS; 4. EPISTOLÆ, *et ad eas* RESPONSIONES; 5. COMPENDIUM GRAMMATICES LINGUÆ HEBRÆÆ.

The ETHICA are divided into five parts, which treat in order, *de* DEO; *de natura et origine* MENTIS; *de origine et natura* AFFECTUUM; *de* SERVITUTE *humana, seu de* AFFECTUUM VIRIBUS; *de* POTENTIA INTELLECTUS, *seu de* LIBERTATE *humana*. As the author professes to tread in the footsteps of the geometers, and to deduce all his conclusions by rigid demonstration from a few self-evident truths, he introduces his work, after the manner of Euclid, with a collection of *definitions* and *axioms*. These are couched in terms generally ambiguous; and therefore the reader will do well to consider attentively in what sense, if in any, they can be admitted; for it will not be found easy to grant his premises, and at the same time refuse his conclusions. His definition of substance, for instance, is so expressed as to admit of two senses; in one of which it is just, whilst in the other it is the parent of the most impious absurdity. We shall give it in his own words: "Per substantiam intelligo id, quod in se est, et per se concipitur: hoc est id, cujus conceptus non indiget conceptu alterius rei, à quo formari debeat." If by this be meant, that a substance is that which we can conceive by itself without *attending* to any thing else, or *thinking* of its formation, the definition, we believe, will be admitted by every reflecting mind as sufficiently distinguishing the thing defined from an attribute, which, he says, is that which we perceive *of* a substance, and which we certainly cannot conceive as existing by itself. Thus the writer of this article can shut his eyes and contemplate in idea the small 4to volume now before him, without attending to any thing else, or thinking of its paradoxical author, or even of the Great Being who created the matter both of him and of it; but he cannot for an instant contemplate the yellow colour of its vellum boards without thinking of triple extension, or, in other words, of body. The book therefore is a *substance*, because conceivable by itself; the colour is an *attribute* or *quality*, because it cannot be conceived by itself, but necessarily leads to the conception of something else. But if Spinoza's meaning be, that nothing is a substance but what is conceived as existing from eternity, independent of every thing as a cause, his definition cannot be admitted; for every man conceives that which in himself thinks, and wills, and is conscious, as a substance; at the same time that he has the best evidence possible that he existed not as a conscious, thinking, and active being, from eternity.

His fourth axiom is thus expressed: "Effectus cognitio à cognitione causæ dependet, et eandem involvit;" and his fifth, "Quæ nihil commune cum se invicem habent, etiam per se invicem intelligi non possunt, sive conceptus unius alterius conceptum non involvit." The former of these propositions, so far from being self-evident, is not even true; and the latter is capable of two senses very different from each other. That every ef-

Spinoza.

fect proceeds from *a cauſe*, is indeed an axiom; but ſurely we may know the effect accurately, though we be ignorant of the *particular* cauſe from which it proceeds (ſee PHILOSOPHY, N° 36; and PHYSICS, N° 91, &c.); nor does the knowledge of the one by any means involve the knowledge of the other. If different things have nothing in common, it is indeed true that the knowledge of one of them will not give us an *adequate conception* of the other; but it will in many caſes compel us to believe, that the other *exiſts* or has exiſted. A parcel of gunpowder lying at reſt has nothing in common with the velocity of a cannon-ball; yet when we know that a ball has been driven with velocity from a cannon, we infer with certainty that there has been a parcel of powder at reſt in the chamber of that cannon.

It is upon ſuch ambiguous definitions and axioms as theſe that Spinoza has raiſed his pretended demonſtrations, that one ſubſtance cannot produce another; that every ſubſtance muſt neceſſarily be infinite; that no ſubſtance exiſts or can be conceived beſides God; and that extended ſubſtance or body is one of the infinite *attributes* of God. We ſhall not waſte our own time or the readers with a formal confutation of theſe impious abſurdities. We truſt they are ſufficiently confuted in other articles of this work (ſee METAPHYSICS, Part III. PROVIDENCE, and THEOLOGY, Part I.); and whoever wiſhes for a more particular examination of the author's principles, may find it in Dr Clarke's Demonſtration of the Being and Attributes of God. The truth, however, is, that no man will need the aſſiſtance of that eminent metaphyſician to diſcover the fallacy of the reaſoning by which they are attempted to be proved, if he affix *any one preciſe meaning* to the definitions and axioms, and adhere to that meaning ſteadily through the whole proceſs of the pretended demonſtrations.

By way of apology for this jargon, it has been lately ſaid, that "Spinoza takes the word *ſubſtance* in its moſt ſimple and perfect ſenſe; which is neceſſary, as he writes mathematically, and propoſes a ſimple idea as the foundation of his theory. What is the proper ſignification of a ſubſtance? Is it not that which ſtands alone, which has the cauſe of its exiſtence within itſelf? I wiſh that this ſimple meaning of the word could be univerſally admitted in philoſophy. Strictly ſpeaking, no worldly thing is a ſubſtance; ſince all mutually depend on each other, and finally on God, who, in this exalted ſenſe, is the only *ſubſtance*. The word *modification* ſounds harſh and improper, and therefore it cannot be expected to gain a place in philoſophy; but if the ſchool of Leibnitz may term matter the *appearance of ſubſtances*, why may not Spinoza be allowed a bolder term? Worldly ſubſtances are kept in union by divine power, as it was by divine power that they had exiſtence. They repreſent alſo, if you pleaſe, *modified* appearances of divine power; each according to the ſtation, the time, and the organs, in and with which it appears. The phraſe uſed by Spinoza is conciſe, and it gives an unity and ſimplicity to his whole ſyſtem, however ſtrange it may ſound in our ears."

Herder's Dialogues concerning God.

From this account of Spinoziſm, one who had never looked into the works of the author would be led to ſuppoſe that his ſyſtem is the ſame with that of Berkeley; which, denying the exiſtence of material ſubſtance, attributes all our perceptions of what we call the qualities of body to the immediate agency of the Deity on our minds (ſee METAPHYSICS, Part II. chap. 3.). But Spinoza's doctrine is very different. According to him, bodies are either attributes or affections of God; and as he ſays there is but one extended ſubſtance, he affirms that ſubſtance to be indiviſible, and employs a long ſcholium † to prove that thoſe are miſtaken who ſuppoſe it finite and not *eſſential to the Deity*. That we do not miſrepreſent his ſentiments, the learned reader will be convinced by the two following definitions, with which he introduces that part of his ethics which treats of the nature and origin of mind. 1. "Per corpus intelligo modum, qui Dei eſſentiam, quatenus, ut res extenſa conſideratur, certo et determinato modo exprimit." 2. "Ad eſſentiam alicujus rei id pertinere dico, quo dato res neceſſario ponitur, et quo ſublato res neceſſario tollitur; vel id, ſine quo res, et vice verſa quod ſine re nec eſſe nec concipi poteſt." In conformity with theſe definitions, he attempts to prove that God is an extended as well as a thinking ſubſtance; that as a thinking ſubſtance he is the cauſe of the *idea* of a circle, and as an extended ſubſtance of the *circle* itſelf; and that the minds of men are not ſubſtances, but certain modifications of the divine attributes; or, as he ſometimes expreſſes it. "Quod humanæ mentis actuale conſtituit, eſt idea rei ſingularis actu exiſtentis." Hence, he ſays, it follows that the human mind is a part of the intellect of the infinite God; ſo that when we ſpeak of the human mind perceiving this or that, we can only mean that God, not as he is infinite, but as he appears in the human mind or conſtitutes its eſſence, has this or that idea; and when we ſpeak of God's having this or that idea, we muſt conceive of Him not only as conſtituting the human mind, but as, together with it, having the idea of ſomething elſe (A). In another place he tells us, that the human mind is nothing but the *idea* which God has of the human body as actually exiſting; that this *idea* of the body, and the *body* itſelf, are one and the ſame thing; and that thinking and extended ſubſtances are in reality but one and the ſame ſubſtance, which is ſometimes comprehended under one attribute of the Deity, and ſometimes under another*.

† See his Prop. xv. &c.

Prop. vii. xi. Part ii.

* Prop. v. x. xiii. xxi. Part 2.

If this impious jargon be not Atheiſm, or as it has been ſometimes called Pantheiſm, we know not what it is (See PANTHEISM). According to Spinoſa, there is but one ſubſtance, which is extended, infinite, and indiviſible. That ſubſtance indeed he calls God; but he labours to prove that it is corporeal; that there is no difference between mind and matter; that both are attributes

---

(A) Hinc ſequitur mentem humanam partem eſſe infiniti intellectus Dei; ac proinde cum dicimus, mentem humanam hoc vel illud percipere, nihil aliud dicimus quam quod Deus, non quatenus infinitus eſt, ſed quatenus per naturam humanæ mentis explicatur, ſive quatenus humanæ mentis eſſentiam conſtituit, hanc vel illam habet ideam et cum dicimus Deum hanc vel illam ideam habere, non tantum, quatenus naturam humanæ mentis conſtituit; ſed quatenus ſimul cum mente humana alterius rei etiam habet ideam. *Corol.* prop. xi. part 2.

Spinoza. tributes of the Deity variouſly conſidered; that the human ſoul is a part of the intellect of God; that the ſame ſoul is nothing but the idea of the human body; that this idea of the body, and the body itſelf, are one and the ſame thing; that God could not exiſt, or be conceived, were the viſible univerſe annihilated; and therefore that the viſible univerſe is either the one ſubſtance, or at leaſt an eſſential attribute or modification of that ſubſtance. He ſometimes indeed ſpeaks of the *power* of this ſubſtance; but when he comes to explain himſelf, we find that by power he means nothing but blind neceſſity *; and though he frequently talks of the *wiſdom* of God, he ſeems to make uſe of the word without meaning. This we think evident from the long appendix to his 36th propoſition; in which he labours to prove that the notion of final cauſes is an idle figment of the imagination, ſince, according to him, nothing but the prejudices of education could have led men to fancy that there is any real diſtinction between *good* and *evil*, *merit* and *demerit*, *praiſe* and *reproach*, *order* and *confuſion*; that *eyes* were given them that they might be enabled to *ſee*; *teeth* for the purpoſe of chewing their *food*; *herbs* and *animals* for the *matter* of that *food*; that the *ſun* was formed to give light, or the *ocean* to nouriſh *fiſhes*. If this be true, it is impoſſible to diſcover wiſdom in the operations of his *one ſubſtance*; ſince, in common apprehenſion, it is the very characteriſtic of folly to act without any end in view.

* Prop. xxxii. Part I.

Such are the reveries of that writer, whoſe works a German philoſopher of ſome name has lately recommended to the public, as calculated to convey to the mind more juſt and ſublime conceptions of God than are to be found in moſt other ſyſtems. The recommendation has had its effect. A literary journaliſt of our own, reviewing the volume in which it is given, feels a peculiar ſatisfaction from the diſcovery, that Spinoza, inſtead of a formidable enemy to the cauſe of virtue and religion, was indeed their warmeſt friend; and piouſly hopes that we ſhall become more cautious not to ſuffer ourſelves to be deceived by empty names, which thoſe who *cannot* reaſon (Sir Iſaac Newton and Dr Clarke perhaps) give to thoſe who can (Hobbes, we ſuppoſe, and Spinoza). But though we have the honour to think on this queſtion with our illuſtrious countrymen, we have no deſire to depict Spinoza as a *reprobate*, which the critic ſays has often been done by ignorance and enthuſiaſm. We admit that his conduct in active life was irreproachable; and for his ſpeculative opinions, he muſt ſtand or fall to his own Maſter. His Ethics appear to us indeed a ſyſtem ſhockingly impious; and in the tract intitled POLITICA, *power* and *right* are confounded as in the former volume; but in the treatiſe DE INTELLECTUS EMENDATIONE, are ſcattered many precepts of practical wiſdom, as well as ſome judicious rules for conducting philoſophical inveſtigation; and we only regret, that the reader muſt wade to them through pages of fataliſm, ſcepticiſm, and palpable contradictions. His *Compendium Grammatices Linguæ Hebrææ*, though left imperfect, appears to have ſo much merit, that it is to be wiſhed he had fulfilled his intention of writing a philoſophical grammar of that language, inſtead of waſting his time on abſtruſe ſpeculations, which though they ſeem not to have been injurious to his own virtue, are certainly not calculated to promote the virtue of others, or to increaſe the ſum of human happineſs.

Spiræa || Spirituous.

SPIRÆA, a genus of plants belonging to the claſs of icoſandria, and to the order of pentagynia; and in the natural ſyſtem arranged under the 26th order, *Pomaceæ*. See BOTANY *Index*.

SPIRAL, in *Geometry*, a curve line of the circular kind, which in its progreſs recedes from its centre.

SPIRE, in *Architecture*, was uſed by the ancients for the baſe of a column, and ſometimes for the aſtragal or tore; but among the moderns it denotes a ſteeple that continually diminiſhes as it aſcends, whether conically or pyramidally.

SPIRIT, in *Metaphyſics*, an incorporeal being or intelligence; in which ſenſe God is ſaid to be a ſpirit, as are angels and the human ſoul. See METAPHYSICS, Part III.

SPIRIT, in *Chemiſtry* and *Pharmacy*, a name applied to every volatile liquid which is not inſipid like phlegm or water; and hence the diſtinction into acid, alkaline, and vinous ſpirits.

SPIRIT of Wine. See ALCOHOL, CHEMISTRY *Index*; DISTILLATION, and MATERIA MEDICA *Index*.

SPIRITS, or ANIMAL SPIRITS. See ANATOMY, Part V. n° 136.

SPIRITUAL, in general, ſomething belonging to or partaking of the nature of ſpirit. See SPIRIT.

SPIRITUOUS LIQUORS have in all nations been conſidered as a proper ſubject of heavy taxation for the ſupport of the ſtate. This has naturally occaſioned a nice examination of their ſtrength. It having been at laſt found that this was intimately connected with the ſpecific gravity, this has been examined with the moſt ſcrupulous attention to every circumſtance which could affect it, ſo that the duties might be exactly proportioned to the quantity of ſpirit in any ſtrong liquor, independent on every other circumſtance of flavour or taſte, or other valued quality. The chemiſt at laſt found that the baſis of all ſtrong liquors is the ſame, produced by the vinous fermentation of pure ſaccharine matter diſſolved in water. He alſo found, that whether this vegetable ſalt be taken as it is ſpontaneouſly formed in the juices of plants and fruits, or as it may be formed or extricated from farinaceous fruits and roots by a certain part of the proceſs of vegetation, it produces the ſame ardent ſpirit, which has always the ſame denſity in every mixture with water. The minute portions of aromatic oils, which are in ſome degree inſeparable from it, and give it a different flavour according to the ſubſtance from which it was obtained, are not found to have any ſenſible effect on its denſity or ſpecific gravity. This ſeems very completely eſtabliſhed in conſequence of the unwearied attempts of the manufacturers to leſſen the duties payable on their goods by mixtures of other ſubſtances, which would increaſe their denſity without making them leſs palatable. The vigilance of the revenue officers was no leſs employed to detect every ſuch contrivance. In ſhort, it is now an acknowledged point, that the ſpecific gravity is an accurate teſt of the ſtrength.

But though this is true in general, we cannot derive much benefit from it, unleſs we know the preciſe relation between the ſtrength and the denſity of a ſpirituous liquor. Do they increaſe *pari paſſu*, or by what law

law are they connected? It was natural to expect that equal additions of ardent spirits or alcohol to a given quantity of water would produce equal diminutions of density. Areometers were accordingly made on this principle above 200 years ago, as may be seen in the works of Gaspar Schottus, Sturmius, Agricola, and other old authors. But when mathematical physics became more generally known, this was easily discovered to be erroneous; and it was shown (we think first by Mr Boyle) that equal additions to the specific gravity would be produced by successively taking out of any vessel a certain measure of alcohol and replacing it with an equal measure of water. This was the most convenient discovery for all parties, because then the duties payable on a cask of spirits would be in the exact proportion of the diminution of its density. But it was soon found by those who were appointed guardians of the revenue that this conclusion was erroneous, and that a mixture which appeared by this rule to contain 35 gallons of alcohol, did really contain $35\frac{1}{4}$. This they found by actually making such a mixture: 18 gallons of alcohol mixed with 18 of water produced only 35 gallons of spirits. The revenue officers, finding that this condensation was most remarkable in mixtures of equal parts of water and the strongest spirits which could then be procured, determined to levy the duties by this mixture; because, whether the spirituous liquor was stronger or weaker than this, it would appear, by its specific gravity, rather stronger than it really was. This sagacious observation, and the simplicity of the composition, which could at all times be made for comparison, seem to be the reasons for our excise offices selecting this mode of estimating the strength and levying the duties. A mixture of nearly equal measures of water and alcohol is called PROOF SPIRIT, and pays a certain duty per gallon; and the strength of a spirituous liquor is estimated by the gallons, not of alcohol, but of proof spirit which the cask contains. But because it might be difficult to procure at all times this proof spirit for comparison, such a mixture was made by order of the board of excise: and it was found, that when six gallons of it was mixed with one gallon of water, a wine gallon of the mixture weighed 7 pounds 13 ounces avoirdupois. The board therefore declared, that the spirituous liquor of which the gallon weighed 7 pounds 13 ounces should be reckoned 1 to 6 or 1 in 7 under proof. This is but an aukward and complex formula; it was in order to suit matters to a mode of examination which had by time obtained the sanction of the board. Mr Clarke, an ingenious artist of that time, had made a hydrometer incomparably more exact than any other, and constructed on mathematical principles fit for computation. This had a set of weights corresponding to the additions of water or proof spirit, and the mixture 1 to 6 or 1 in 7 was the only one which weighed an exact number of ounces per gallon without a fraction.

Thus stands the excise law; and Clarke's hydrometer is still the instrument of authority, although others have been since constructed by DICAS, QUIN, and others, which are much more ingenious and convenient. The mathematician who examines Dicas's hydrometer, with its sliding scale, by which it is adjusted to the different temperatures, and points out the condensations, will perceive a beautiful and sagacious combination of quantities, which he will find it difficult to bring under any analytical formula. Perhaps Quin's may have some preference in respect of conveniency; but *facile inventis addere*. Mr Dicas's was original (A).

As naturalists became more accustomed to exact observations in every topic of inquiry, the condensation which obtains in the mixture of different substances became more familiarly known. This evidently affects the present question; and both the excise and the distillers are interested in its accurate decision. This occasioned an application to the Royal Society; and a most scrupulous examination of the strength of spirituous liquors was made by Sir Charles Blagden and Mr Gilpin, of which they have given a very particular account in the Philosophical Transactions for 1790 and 1792.

We have taken notice of this in the article SPECIFIC GRAVITY, mentioning such circumstances of the results as suited our purposes of physical discussion. At present

(A) Among the various contrivances which have been thought of, among manufacturers and dealers, as well as for the purposes of revenue, for ascertaining the specific gravity, and consequently the real strength and value of high-priced and high-taxed liquids, we are persuaded there is none equal, in point of accuracy, simplicity, and facility of application, to the areometrical beads lately announced to the public by Mrs Lovi of Edinburgh, under the privilege of a patent; and with this persuasion we have no hesitation in recommending them to those to whom the use of a simple and accurate instrument is of great importance in determining the value of high-priced spirituous liquors. Our recommendation rests not solely on our own opinion, but is supported by that of others who are well acquainted with such subjects. We know, too, that the beads have been examined and compared by several intelligent manufacturers and dealers with some of the most accurate hydrometrical instruments, and after a fair trial, a decided preference has been given to the beads. The whole apparatus consists of 30 beads, a sliding rule, a thermometer, a glass jar and brass hook, which are packed in a neat small box; and it is accompanied with directions, which point out, 1. In what manner the real strength of spirits may be ascertained at any given temperature between 40° and 80°. 2. How much per cent. the spirit to be tried is over or under proof according to the practice of spirit dealers; and, 3. The proportion of water and the strongest spirits or alcohol, according to the views and language of excisemen. The advantages of these beads are, that being made of a substance which is little acted on by chemical agents, they are less liable to be injured by use, than instruments composed of metal; and when a bead happens to be broken, it can be easily replaced. They possess this farther advantage, that with the application of the thermometer, and the calculation of the sliding rule, the real strength of the spirits may be taken at all temperatures. It has been suggested, that these beads, from their being less liable to change than other instruments, might be usefully employed in checking the errors and variations of other hydrometers. Beads are prepared by Mrs Lovi on the same principle for ascertaining the strength of worts, acids, &c.

fent we give the general refult in the table of fpecific gravity, as peculiarly belonging to fpirituous liquors, affording the moft exact account of their denfity in every ftate of dilution of alcohol with water. And as the relation between the proportion of ingredients and the denfity is peculiar to every fubftance, fo that fcarcely any inference can be made from one to another, the reader will confider the tables here given as characteriftic with refpect to alcohol. In all folutions of falts we found that the condenfation increafes continually with the dilution, whereas it is greateft when equal bulks of water and alcohol are mixed; yet we do not confider this as an exception; for it is certain, that in the ftrongeft brine the faline ingredient bears but a fmall proportion to the water—and when we mix two folutions, the condenfation is greateft when they are nearly equal in bulk. But we think ourfelves entitled to infer, that alcohol is not a dilution of a fubftance in a quantity of water; but that water, in a certain proportion, not very diftant from what we can produce by flow diftillation, is an ingredient of alcohol, or is one of its component parts, and not merely a vehicle or menftruum. We therefore imagine that proof fpirit contains nearly equal bulks of water and ardent fpirits.

The great difficulty in this examination arofe from the very diffimilar expanfions of water and alcohol by heat. This determined Sir Charles Blagden to eftimate the proportions of ingredients by weight, and made it abfolutely neceffary to give a fcale of fpecific gravity and ftrength for every temperature. For it muft be remarked, that the queftion (whether in commerce or philofophy) always is, "How many gallons of alcohol and of water, taken juft now and mixed together, will produce a hundred gallons of the fpirit we are examining?" The proportion of thefe two will be different according to the temperature of both. As many mixtures therefore muft have been made in each proportion as there were temperatures confidered; but by taking the ingredients by weight, and examining the denfity of the compound in one temperature, it is then heated and cooled, and its change of denfity obferved. Calculation then can tell us the change in the proportion of the bulks or numbers of gallons in the mixture, by means of a previous table fhowing the expanfions of water and of alcohol.

The alcohol felected for this examination had the fpecific gravity 0.825. This is not the pureft that can be procured; fome was produced of 0.816, of 0.814, and 0.813, both obtained from rum, from brandy, and from malt fpirit. We are informed that Dr Black has obtained it of the fpecific gravity 0.8 by digefting alcohol with fixed ammoniac (muriatic acid united with lime) made very dry. It dephlegmates alcohol very powerfully without decompofing it, which always happens when we ufe cauftic alkali. Alcohol of 0.825 was chofen becaufe expreffed by a number of eafy management in computation.

The examination commenced by afcertaining the expanfions of water and alcohol. The temperature 60° of Fahrenheit's fcale was felected for the general temperature of comparifon, being eafily attainable even in cold weather, and allowing the examinator to operate at eafe. The firft and laft compartments of the tables contain the weights and fpecific gravities of alcohol and water for every fifth degree of heat from 30° to 100°. From thefe we have conftructed the two following little tables of expanfion. The bulk of 1000 ounces, pounds, or other weight of water and of alcohol of the temperature 60°, occupies the bulks expreffed in the tables for every other temperature. Water could not be eafily or ufefully examined when of the temperature 30°, becaufe it is with great difficulty kept fluid in that temperature. It is very remarkable, that when it can be fo kept, it expands inftead of contracting; while cooling down from 35° or thereabouts, and as it approaches to 32°, it expands rapidly. We obferve the fame thing in the cryftallization of Glauber falt, martial vitriol, and fome others, which contain much water in their cryftals. We obferve, on the other hand, a remarkable contraction in the zeolite juft before its beginning to fwell into bubbles by a red heat.

Heat.	Bulk of 100,000 ounces.

This being premifed, the examination was conducted in the following manner. It was determined to mix 100 parts by weight of pure alcohol with five, ten, fifteen, twenty, parts of diftilled water, till they were compounded in equal quantities, and then to mix 100 parts of diftilled water with, 95, 90, 85, 80, &c. parts of alcohol, till they were mixed in the proportion of 100 to 5. Thus a feries of mixtures would be obtained, extending from pure alcohol to pure water. This feries would be fuch, that the examinations would be moft frequent in the cafes moft ufual in the commerce of ftrong liquors. A fet of phials, fitted with ground ftoppers, were provided, of fizes fit to hold the intended mixtures. Thefe mixtures were made by fufpending the phial to the arm of a very nice balance, in the oppofite fcale of which (befides the counterpoife of the phial) there was placed the weight 100. Spirit was then poured into the phial till it exactly balanced the weight 100. The weight for the water to be added was then put into the oppofite fcale, and water was poured into the phial by means of a flender glafs funnel, by fmall quantities at a time, and the phial frequently agitated to promote the mixture. When the additional weight was exactly balanced, the phial was taken off, its ftopper put in, and leather tied over it, and it was fet by, for at leaft a month, that the mixture and the whole procefs of condenfation might be completed. The fame method

method was followed in the mixtures where the water was predominant.

When the ingredients of thefe mixtures were judged to have completely incorporated, their fpecific gravity was examined by weighing with the moft fcrupulous precifion the contents of a veffel which held 2925 troy grains of water, of the temperature 60°. The balance was fo exceedingly fenfible, that the 50th part of a grain greatly deranged its pofition when loaded with the fcales and their contents. It was conftructed by Mr Ramfden, and fome account of its exquifite fenfibility may be feen in the *Journal de Phyfique*, vol. xxxiii. This quantity of materials was therefore thought abundantly fufficient for afcertaining the denfity of the liquor. It is needlefs to detail the precautions which were taken for having the contents of the weighing bottle brought to the precife temperature proper for the experiment. They were fuch as every perfon converfant with fuch things is accuftomed to take.—The bottle had a flender neck, and being put on a lathe, a mark was made round it with a diamond. The bottle was filled till the bottom of the hollow furface of the fluid was in the plane of this mark; and to judge of the accuracy attainable in filling the bottle, the operation was feveral times repeated and the contents weighed, without the difference of $\frac{1}{30}$th of a grain in 2925. The only fource of error which was to be guarded againft was air-bubbles adhering to the infide of the bottle, or moifture condenfing (in the experiments with low temperatures) on the outfide. Both of thefe were attended to as much as poffible.

This method of determining the fpecific gravity was preferred to the ufual method, obferving the weight loft by a lump of glafs when fufpended in water; for Mr Gilpin had been enabled, by means of this nice balance, to difcover, even in pure water and in alcohol, a want of perfect fluidity. Something like vifcidity rendered the motion of a lump of glafs through the liquor fenfibly fluggifh, fo that when the balance was brought to a level, there was not a perfect equilibrium of weights: (See what we have faid of this matter in SPECIFIC GRAVITY). Mr Gilpin alfo tried the ingenious inftrument propofed for fuch experiments by Mr Ramfden, and defcribed by him in a pamphlet on this very fubject; and he found the anomalies of experiment much greater than in this method by weighing.—Indeed the regular progreffion of weights to be feen in the annexed tables is an unqueftionable proof of the fufficiency of the method; and it has the evident advantage of all other methods in point of fimplicity and practicability without any uncommon apparatus. Any perfon poffeffed of a good ordinary balance and a fet of exact weights may examine all queftions of this kind, by weighing pure water and the liquor which he may have occafion to examine in a common 6 or 8 ounce phial. For this reafon, it is recommended (in preference to all hydrometers) to the board of excife to provide this fimple apparatus in every principal office.

Every experiment was made at leaft three times; and the mean refult (which never differed one grain from the extreme) was taken.

From thefe experiments the annexed tables were conftructed. The firft is the fimple abftract of the experiments, containing the weights of the contents of the bottle of every mixture. The fecond contains the fpecific gravities deduced from them.

We have faid that the experiments appear furprifingly accurate. This we fay on the authority of the regular progreffion of the fpecific gravity in any of the horizontal rows. In the feries, for inftance, for the temperature 60°, the greateft anomaly is in the mixture of 50 parts of fpirit with 100 of water. The fpecific gravity is 95804, wanting 3 or 4 of the regular progreffion. This does not amount to 1 in 18000.

TABLE I. Weights at the different Degrees of Temperature.

We formerly obferved, that the feries of mixtures chofen by Sir Charles Blagden, for the advantages attending it in making the experiment, was not fuited for folving the queftions which commonly occur in the fpirit bufinefs. He accordingly fuggelts the propriety of forming tables in a convenient feries from the data furnifhed by thefe experiments, indicating the proportion of ingredients contained in fome conftant weight or bulk.

To facilitate the conftruction of fuch tables, it is neceffary to confider the fubject in the moft general manner. Therefore let a reprefent the conftant number 100. Let w and s reprefent the quantities of water and fpirit by weight in any mixture; that is, the pounds, ounces, or grains of each. Let x reprefent the quantity per cent. of fpirits alfo by weight; that is, the number of pounds of fpirits contained in 100 pounds of the mixture; and let y be its quantity per cent. in gallons, or the number of gallons contained in 100 gallons of the unmixed ingredients. Let m be the bulk of a pound of fpirit of any given temperature, the bulk of a pound of water *of the fame temperature* being accounted 1.

Then $w+s$ is the weight of any mixture, and $w+ms$ is its bulk.

We have the following proportions: 1. $w+s:s=a:x$, and $x=\frac{as}{w+s}$ (Equation 1ft); and hence s may be found when x the per centage in weight is given, for $s=\frac{wx}{a-x}$ (Equation 2.)

2. $w+ms:ms=a:y$, and $y=a\frac{ms}{w+ms}$ (Equation 3d); and s may be found when y, the per centage in gallons, is given; for $s=\frac{my}{a-y}$ (Equation 4th).

The ufual queftions which can be folved from thefe experiments are,

1. To afcertain the quantity of fpirits per cent. in bulk from obfervation of the fpecific gravity, or to tell how many gallons of fpirit are in 100 gallons of mixture.

Look for the fpecific gravity in the table, and at the head of the column will be found the w and s correfponding. If the precife fpecific gravity obferved is not in the tables, the s muft be found by interpolation. And here it is proper to remark, that taking the fimple proportional parts of fpecific gravity will not be fufficiently exact, efpecially near the beginning or the end of the table, becaufe the denfities correfponding to the feries of mixtures do not change uniformly. We muft have recourfe to the general rules of interpolation, by means of firft and fecond differences, or be provided with a fubfidiary table of differences. A good deal of practice in computations of this kind fuggefted the following method of making fuch interpolations with great difpatch and abundant accuracy. On a plate of wood or metal, or ftiff card-paper, draw a line EF (fig. 1.), as a fcale of equal parts, reprefenting the leading or equable arithmetical feries of any table. (In the prefent cafe EF is the fcale on which s is computed.)—Through every point of divifion draw the perpendiculars BA, EC, FD, &c. Make one of them AB more confpicuous than the reft, and diftinguifh the others alfo in fuch fort, that the eye fhall readily catch their diftance from the principal line AB. Let GPL be a thin flip of whalebone, of uniform breadth and thicknefs, alfo divided into equal parts properly diftinguifhable. Laftly, let there be a pin P fixed near the middle of the principal line AB.

Plate CCCCXCIX Fig. 1.

Now fuppofe that a value of s is to be interpolated by means of an obferved fpecific gravity not in the table. Look for the neareft to it, and note its diftance from the preceding and the following. Let thefe be PH and PK on the flexible fcale. Alfo take notice of the lines K 10 and H 10, whofe diftances from AB are equal to the conftant difference between the fucceffive values of S, or to any eafily eftimated multiple of it (as in the prefent cafe we have taken 10 and 10, inftead of 5 and 5, the running difference of Sir Charles Blagden's table). Then, leaning the middle point P of the whalebone on the pin P in the board, bend it, and place it flantwife till the points K and H fall fomewhere on the two parallels K 10 and H 10. No matter how oblique the pofition of the whalebone is. It will bend in fuch a manner that its different points of divifion (reprefenting different fpecific gravities) will fall on the parallels which reprefent the correfponding values of s. We can fay that all this may be done in lefs than half a minute, and lefs time than is neceffary for infpecting a table of proportional parts, and not the tenth part of that neceffary for interpolating by fecond differences. Yet it is exact enough (if of the fize of a duodecimo page) for interpolating three decimal places. This is ten times more exact than the prefent cafe requires. To return from this digreffion.

Having thus found s in the table, we get x or y by the equations $\frac{as}{w+s}=x$, and $a\frac{ms}{w+ms}=y$.

But here a material circumftance occurs. The weight of alcohol s, and its per centage x, was rightly determined by the fpecific gravity, becaufe it was interpolated between two values, which were experimentally connected with this fpecific gravity. But in making the tranfition from x to y, we only give the per centage in gallons before mixture, but not the number of gallons of alcohol contained in an hundred gallons of mixed liquor. For when we have taken $\overline{a-y}$ and y inftead of w and s, they will indeed make a fimilar compound when mixed, becaufe the proportion of their ingredients is the fame. But they will not make 100 gallons of this compound, becaufe there is a fhrinking or condenfation by mixture, and the fpecific gravity by which we interpolated s is the phyfical or real fpecific gravity correfponding to w and s; while $\frac{w+s}{w\times ms}$, the fpecific gravity implied in the value of y, is the mathematical denfity independent on this condenfation. Since therefore y, together with $\overline{a-y}$, make lefs than 100 gallons of the compound, there muft in 100 gallons of it be more alcohol than is expreffed by y.

Let G be the mathematical fpecific gravity $\left(=\frac{w+s}{w+ms}\right)$, and g the phyfical or real obferved fpecific gravity (which we cannot exprefs algebraically); and let z be the gallons of alcohol really contained in 100 gallons of the compound. The bulk being inverfely as the denfity or fpecific gravity, it is evident that the bulk of the compound muft be to 100 gallons as g to to G. And ſince we want to make it ſtill up to 100 gallons, we muſt increaſe it in the proportion of G to g. And becauſe this augmentation muſt be of the ſame ſtrength with this contracted liquor, both ingredients muſt be increaſed in the proportion of G to g, and we muſt have $G : g = y : z$, and $z = g \times \frac{y}{G}$. Now, inſtead of y, write $a \frac{m s}{w + m s}$, and inſtead of $\frac{1}{G}$ write $\frac{w + m s}{w + s}$, which are reſpectively equal to them. This gives us $z = g a \times \frac{w + m s}{w + s} \times \frac{m s}{w + s}, = g a \times \frac{m s}{w + s}$.

All this will be illuſtrated by an example.

Suppoſe that we have obſerved the ſpecific gravity of a ſpirituous liquor of the temperature 60° to be 0.94128. Looking into Sir Charles Blagden's table, we find the gravities 0.94018 and 0.94296, and the s correſponding to them is 80 and 75, the water in each mixture being 100. By interpolation we obtain the s correſponding to 0.94128, viz. 78. At this temperature $m = \frac{1}{0.825}, = 1.21212$, and $m s = 94.54545$. Therefore $z = 0.94128 \times 100 \times \frac{94.54545}{194.54545}, = 49{,}997$, or very nearly 50.

We have ſeen even perſons not unacquainted with ſubjects of this kind puzzled by this ſort of paradox. z is ſaid to be the per centage of ſpirit in the compound. The compound has the ſame proportion of ingredients when made up to 100 gallons as before, when y was ſaid to be its per centage, and yet y and z are not the ſame. The fact is, that although z is the number of gallons of alcohol really contained in 100 gallons of the compound, and this alcohol is in the ſame proportion as before to the water, this proportion is not that of 50 to 50: for if the ingredients were ſeparated again, there would be 50 gallons of alcohol and 52,876 of water.

The proportion of the ingredients in their ſeparate ſtate is had by the 3d equation $y = a \frac{m s}{w + m s}$, which is equivalent to $G\,a \frac{m s}{w + s}$. For the preſent example y will be found 48.599, and $a - y$, or the water per cent. 51.401, making 100 gallons of unmixed ingredients. We ſee then that there has been added 1.398 gallons of alcohol; and ſince both ingredients are augmented in the proportion of G to g, there have alſo been added 1.478 of water, and the whole addition for making up the 100 gallons of compound is 2.876 gallons; and if the ingredients of the compound were ſeparate, they would amount to 102,876 gallons. This might have been found at the firſt, by the proportion, $G : g - G = 100$: *(The addition)*.

The next queſtion which uſually occurs in buſineſs is to find what denſity will reſult from any propoſed mixture per gallon. This queſtion is ſolved by means of the equation $\frac{w y}{m (a - y)} = s$. In this examination it will be moſt convenient to make $w = a$. If the value of s found in this manner falls on a value in the tables, we have the ſpecific gravity by inſpection. If not, we muſt interpolate.

N. B. The value of m, which is employed in theſe reductions, varies with the temperature. It is always obtained by dividing the ſpecific gravity of alcohol of that temperature by the ſpecific gravity of water of the ſame temperature. The quotient is the real ſpecific gravity of alcohol for that temperature. Both of theſe are to be had in the firſt and laſt copartments of Sir Charles Blagden's table.

Theſe operations for particular caſes give the anſwers to particular occaſional queſtions. By applying them to all the numbers in the table, tables may be conſtructed for ſolving every queſtion by inſpection.

There is another queſtion which occurs moſt frequently in the exciſe tranſactions, and alſo in all compoſitions of ſpirituous liquors, viz. What ſtrength will reſult from a mixture of two compounds of known ſtrength, or mixing any compound with water? To ſolve queſtions of this kind by the table ſo often quoted, we muſt add into one ſum the water per gallon of the different liquors. In like manner, take the ſum of the ſpirits, and ſay, as the ſum of the waters is to that of the alcohols, ſo is a to s; and operate with a and s as before.

Analogous to this is the queſtion of the duties. Theſe are levied on proof ſpirit; that is, a certain duty is charged on a gallon of proof ſpirit; and the gauger's buſineſs is to diſcover how many gallons of proof ſpirit there is in any compound. The ſpecification of proof ſpirit in our exciſe laws is exceedingly obſcure and complex. A gallon weighing 7 pounds 13 ounces (at 55°) is accounted 1 to 6 under proof. The gallon of water contains 58476 grains, and this ſpirit is 54688. Its denſity therefore is 0.93523 at 55°, or (as may be inferred from the table) 0.9335 at 60°. This denſity correſponds to a mixture of 100 grains of water with 93.457 of alcohol. If this be ſuppoſed to reſult from the mixture of 6 gallons of alcohol with 1 of water (as is ſuppoſed by the deſignation of 1 to 6 under proof), the gallon of proof ſpirits conſiſts of 100 parts of ſpirits by weight, mixed with 75 parts of water. Such a ſpirit will have the denſity 0.9162 nearly.

This being premiſed, in order to find the gallons of proof ſpirits in any mixture, find the quantity of alcohol by weight, and then ſay, as 100 to 175, ſo is the alcohol in the compound to the proof ſpirit that may be made of it, and for which the duties muſt be paid.

We have conſidered this ſubject at ſome length, becauſe it is of great importance in the ſpirit-trade to have theſe circumſtances aſcertained with preciſion; and becauſe the ſpecific gravity is the only ſure criterion that can be had of the ſtrength. Firing of gunpowder, or producing a certain bubble by ſhaking, are very vague teſts; whereas, by the ſpecific gravity, we can very ſecurely aſcertain the ſtrength within one part in 500, as will preſently appear.

Sir Charles Blagden, or Mr Gilpin, has publiſhed * a moſt copious ſet of tables, calculated from theſe valuable experiments. In theſe, computations are made for every unit of the hundred, and for every degree of the thermometer. But theſe tables are ſtill not in the moſt commodious form for buſineſs. Mr John Wilſon, an ingenious gentleman reſiding at Dundee, has juſt publiſhed

* Philoſ. Tranſact. 1794.

lished at Edinburgh tables somewhat similar, founded on the same experiments. Both of these tables show the quantities by measure corresponding to every unit by weight of Sir Charles Blagden's experiments, and for every degree of temperature. They also show the per centage of alcohol, and the condensation or the quantity lost by mixture. But as they both retain the original series of parts by weight, which is very unusual, the spirit traders will find considerable difficulty in making use of them. Retaining this series also causes all the per centage numbers (which are the only interesting ones to the trader) to be fractional, and no answer can be had without a double interpolation.

We have therefore calculated a table in the form in which it must be most useful and acceptable to those who are engaged in the spirit trade, showing at once the specific gravity which results from any proportion of admixture in hundredth parts of the whole. This answers immediately the chief questions in the terms in which they are usually conceived and proposed. The two first or leading columns show the proportion in gallons, pints, or other cubic measures, of the mixture, the whole quantity being always 100. The second column shows the corresponding specific gravity: so that we can either find the proportion of the ingredients by the observed specific gravity, or find the gravity resulting from any proportion of the ingredients. A third column shows how much the hundred measures of the two ingredients fall short of making an hundred measures of the compound. A simple proportion, which can be done without the pen, will determine what part of this deficiency must be made up by spirit. The use of this table must now be so familiar to the reader's mind, that we need not give further instructions about it.

This is followed by another similar table, giving an immediate answer to the most usual question, "How many measures of alcohol are there really contained in 100 measures? This is also accompanied by a column of condensation. It would have been somewhat more elegant, had the specific gravities in this table made the equable series and leading column. But we did not advert to this till we had computed the table, and the labour was too great to be repeated for slight reasons. The tables are only for the temperature 60°. To this the spirituous liquors can always be brought in these climates; and in cases where we cannot, a moment's inspection of Sir Charles Blagden's table will point out very nearly (or exactly, by a short computation) the necessary corrections.

"In the first table, of which the sole intention is to point out the proportion of ingredients, the specific gravities are computed only to four places, which will always give the answer true to $\frac{1}{8000}$th part. In the last, which is more immediately interesting to the merchant in his transactions with the excise office, the computation is carried one place further."

The consideration of the first of these two tables will furnish some useful information to the reader who is interested in the philosophy of chemical mixture, and who endeavours to investigate the nature of those forces which connect the particles of tangible matter. These vary with the distance of the particle; and therefore the law of their action, like that of universal gravitation, is to be discovered by measuring their sensible effects at their various distances. Their change of distance is seen in the change of density or specific gravity.

Did the individual densities of the water and spirit remain unchanged by mixture, the specific gravity would change by equal differences in the series of mixtures on which this table is constructed; for the bulk being always the same, the change of specific gravity must be the difference between the weight of the gallon of water which is added and that of the gallon of spirit which is taken out. The whole difference of the specific gravities of spirits and water being 1.750 parts in 10,000, the augmentation by each successive change of a measure of spirit for a measure of water would be the 100th part of this, or 17.5. But, by taking the successive differences of density as they occur in the table, we see that they are vastly greater in the first additions of water, being then about 10; after which they gradually diminish to the medium quantity $17\frac{1}{2}$, when water and spirits are mixed in nearly equal bulks. The differences of specific gravity still diminish, and are reduced to 9, when about 75 parts of water are mixed with 25 of spirit. The differences now increase again; and the last, when 99 parts of water are mixed with one part of spirit, the difference from the specific gravity of pure water is above 14.

The mechanical effect, therefore, of the addition of a measure of water to a great quantity of spirit is greater than the similar effect of the addition of a measure of spirits to a great quantity of water. What we call mechanical effect is the local motion, the change of distance of the particles, that the corpuscular forces may again be in equilibrio. Observe, too, that this change is greater than in the proportion of the distance of the particles;

particles; for the denſity of water is to that of ſpirits nearly as 6 to 5, and the changes of ſpecific gravity are nearly as 6 to 3.

We alſo ſee that the changing cauſe, which produces the abſolute condenſation of each ingredient, ceaſes to operate when 75 parts of water have been mixed with 25 of alcohol: for the variation of ſpecific gravity, from diminiſhing comes now to increaſe; and therefore, in this particular ſtate of compoſition, is equable. Things are now in the ſame ſtate as if we were mixing two fluids which did not act on each other, but were mutually diſſeminated, and whoſe ſpecific gravities are nearly as 9 to 10; for the variation 9 of ſpecific gravity may be conſidered as the 100th part of the whole difference, in the ſame manner as 17.7 would have been had water and alcohol ſuſtained no contraction.

The imagination is greatly aſſiſted in the contemplation of geometrical quantity by exhibiting it in its own form. Specific gravity, being an expreſſion of denſity (a notion purely geometrical), admits of this illuſtration.

Plate cccxcix. Fig. 2.

Therefore let AB (fig. 2.) repreſent the bulk of any mixture of water and alcohol. The ſpecific gravity of water may be repreſented by a line of ſuch a length, that AB ſhall be the difference between the gravities of alcohol and water. Suppoſe it extended upwards, towards a, till B a is to A a as 10,000 to 8250. It will ſuit our purpoſe better to repreſent it by a parallelogram a BF e, of any breadth BF. In this caſe the difference of the ſpecific gravities of alcohol and water will be expreſſed by the parallelogram ABFE. If there were no change produced in the denſity of one or both ingredients, the ſpecific gravity of the compound would increaſe as this parallelogram does, and AGHE would be the augmentation correſponding to the mixture of the quantity AG of alcohol with the quantity GB of water, and ſo of other mixtures. But, to expreſs the augmentation of denſity as it really obtains, we muſt do it by ſome curvilineal area DABCHD, which varies at the rate determined by Sir Charles Blagden's experiments. This area muſt be preciſely equal to the rectangle ABFE. It muſt therefore fall without it in ſome places, and be deficient in others. Let DMHKC be the curve which correſponds with theſe experiments. It is evident to the mathematical reader, that the ordinates LM, GH, IK, &c. of this curve are in the ultimate ratio of the differences of the obſerved ſpecific gravities. If A α, $\omega\beta$, &c. are each = 5, the little ſpaces A $\omega\delta$ D, $\omega\beta b\delta$, &c. will be preciſely equal to the differences of the ſpecific gravities 0.8250; 0.8387; 0.8516; &c. correſponding to the different mixtures of water and alcohol. The curve cuts the ſide of the parallelogram in K, where the ordinate GK expreſſes the mean variation of denſity 0.0017.5. IK is the ſmalleſt variation. The condenſation may be expreſſed by drawing a curve $dm\,G\,fk$ parallel to DMGKF, making Dd=AE. The condenſation is now repreſented by the ſpaces comprehended between this laſt curve and the abſciſſa AGB, reckoning thoſe negative which lie on the other ſide of it. This ſhows, not only that the condenſation is greateſt in the mixture AG × GB, but alſo that in mixing ſuch a compound with another AI × IB, there is a rarefaction. Another curve ANOPB may be drawn, of which the ordinates LN, GP, IO, &c. are proportional to the areas ALmd, AGmD, AIkGmd (=AGmd—GIk), &c. This curve ſhows the whole condenſation.

This manner of repreſenting the ſpecific gravities of mixtures will ſuggeſt many curious inferences to ſuch as will conſider them in the manner of Boſcovich, with a view to aſcertain the nature of the forces of coheſion and chemical affinities: And this manner of viewing the ſubject becomes every day more promiſing, in conſequence of our improvements in chemical knowledge; for we now ſee, that mechaniſm, or motive forces, are the cauſes of chemical action. We ſee in almoſt every caſe, that chemical affinities are comparable with mechanical preſſures; becauſe the converſion of a liquid into a vapour or gas is prevented by atmoſpheric preſſure, and produced by the great chemical agent heat. The action of heat, therefore, or of the cauſe of heat, is a mechanical action, and the forces are common mechanical forces, with which we are familiarly acquainted.

" It may be alſo remarked in the column of contractions, that in the beginning the contractions augment nearly in the proportion of the quantity of ſpirits (but more ſlowly); whereas, in the end, the contractions are nearly in the duplicate proportion of the quantity of water. This circumſtance deſerves the conſideration of the philoſopher. We have repreſented it to the eye by the curve $\alpha\,g\,h\,d$."

We ſhould here take ſome notice of the attempt made to elude ſome part of the duties, by adding ſome ingredient to the ſpirits. But our information on this ſubject is not very exact; and beſides it would be doing no ſervice to the trader to put fraud more in his power. There are ſome ſalts which make a very great augmentation of denſity, but they render the liquor unpalatable. Sugar is frequently uſed with this view; 16 grains of refined ſugar diſſolved in 1000 grains of proof ſpirits gave it no ſuſpicious taſte, and increaſed its ſpecific gravity from 0.920 to 0.925, which is a very great change, equivalent to the addition of 9 grains of water to a mixture of 100 grains of alcohol and 80 of water.

SPIRLING, a ſpecies of fiſh. See SALMO, ICHTHYOLOGY, p. 99.

SPITHEAD, a road between Portſmouth and the iſle of Wight, where the royal navy of Great Britain frequently rendezvous.

SPITTLE, in *Phyſiology*. See SALIVA.

SPITZBERGEN. See GREENLAND, N° 10.

SPLACHNUM, a genus of plants belonging to the claſs of cryptogamia, and order of muſci. See BOTANY *Index*.

SPLEEN. See ANATOMY *Index*.

SPLEEN-Wort. See ASPLENIUM, BOTANY *Index*.

SPLENETIC, a perſon afflicted with an obſtruction of the ſpleen.

SPLENT, or SPLINT, among farriers, a callous inſenſible excreſcence, breeding on the ſhank-bone of horſes. See FARRIERY.

SPLICING, in the ſea-language, is the untwiſting the ends of two cables or ropes, and working the ſeveral ſtrands into one another by a fidd, ſo that they become as ſtrong as if they were but one rope.

SPOILS, whatever is taken from the enemy in time of war. Among the ancient Greeks, the ſpoils were divided among the whole army; only the general's ſhare was

was largest: but among the Romans, the spoils belonged to the republic.

SPOLETTO, a duchy of Italy, bounded on the north by the marquisate of Ancona and duchy of Urbino, on the east by Farther Abruzzo, on the south by Sabina and the patrimony of St Peter, and on the west by Orvieto and Perugino. It is about 55 miles in length and 40 in breadth. It was anciently a part of Umbria, and now belongs to the pope.—The name of the capital city is also *Spoletto*. It was formerly a large place, but in 1703 was ruined by an earthquake; from whence it has never recovered itself.

SPOLIATION, in ecclesiastical law, is an injury done by one clerk or incumbent to another, in taking the fruits of his benefice without any right thereunto, but under a pretended title. It is remedied by a decree to account for the profits so taken. This injury, when the *jus patronatus*, or right of advowson, doth not come in debate, is cognizable in the spiritual court: as if a patron first presents A to a benefice, who is instituted and inducted thereto; and then, upon pretence of a vacancy, the same patron presents B to the same living, and he also obtains institution and induction. Now if A disputes the fact of the vacancy, then that clerk who is kept out of the profits of the living, whichever it be, may sue the other in the spiritual court for the spoliation, or taking the profits of his benefice. And it shall there be tried, whether the living were or were not vacant; upon which the validity of the second clerk's pretensions must depend. But if the right of patronage comes at all into dispute, as if one patron presented A, and another patron presented B, there the ecclesiastical court hath no cognizance, provided the tithes sued for amount to a fourth part of the value of the living, but may be prohibited at the instance of the patron by the king's writ of *indicavit*. So also if a clerk, without any colour of title, ejects another from his parsonage, this injury must be redressed in the temporal courts: for it depends upon no question determinable by the spiritual law (as plurality of benefices or no plurality, vacancy or no vacancy), but is merely a civil injury.

SPONDEE, in ancient poetry, a foot consisting of two long syllables, as *omnes*.

SPONDIAS, Brasilian or Jamaica Plum, a genus of plants belonging to the class of decandria. See Botany *Index*.

SPONGIA, Sponge; a genus of animals belonging to the class of vermes, and order of zoophyta. It is fixed, flexible, and very torpid, growing in a variety of forms, composed either of reticulated fibres, or masses of small spines interwoven together, and clothed with a living gelatinous flesh, full of small mouths or holes on its surface, by which it sucks in and throws out the water. Fifty species have already been discovered, of which 10 belong to the British coasts. See Helminthology *Index*.

So early as the days of Aristotle sponges were supposed to possess animal life; the persons employed in collecting them having observed them shrink when torn from the rocks, thus exhibiting symptoms of sensation. The same opinion prevailed in the time of Pliny: But no attention was paid to this subject till Count Marsigli examined them, and declared them vegetables. Dr Peysonell, in a paper which he sent to the Royal Society in the year 1752, and in a second in 1757, affirmed they were not vegetables, but the production of animals; and has accordingly described the animals, and the process which they performed in making the sponges. Mr Ellis, in the year 1762, was at great pains to discover these animals. For this purpose he dissected the spongia urens, and was surprised to find a great number of small worms of the genus of nereis or sea scolopendra, which had pierced their way through the soft substance of the sponge in quest of a safe retreat. That this was really the case, he was fully assured of, by inspecting a number of specimens of the same sort of sponge, just fresh from the sea. He put them into a glass filled with sea-water; and then, instead of seeing any of the little animals which Dr Peysonell described, he observed the papillæ or small holes with which the papillæ are surrounded contract and dilate themselves. He examined another variety of the same species of sponge, and plainly perceived the small tubes inspire and expire the water. He therefore concluded, that the sponge is an animal, and that the ends or openings of the branched tubes are the mouths by which it receives its nourishment, and discharges its excrements.

SPONSORS, among Christians, are those persons who, in the office of baptism, answer or are sureties for the persons baptized.

SPONTANEOUS, a term applied to such motions of the body and operations of the mind as we perform of ourselves without any constraint.

SPOON-bill. See Platalea, Ornithology *Index*.

SPOONING, in the sea-language, is said of a ship, which being under sail in a storm at sea, is unable to bear it, and consequently forced to go right before the wind.

SPORADES, among ancient astronomers, a name given to such stars as were not included in any constellation.

SPORADIC diseases, among physicians, are such as seize particular persons at any time or season, and in any place; in which sense they are distinguished from epidemical and endemical diseases.

SPOTS, in *Astronomy*, certain places of the sun's or moon's disk, observed to be either more bright or dark than the rest; and accordingly called *faculæ et maculæ*. See Astronomy *Index*.

SPOTSWOOD, John, archbishop of St Andrew's in Scotland, was descended from the lairds of Spotswood in the Merse, and was born in the year 1565. He was educated in the university of Glasgow, and succeeded his father in the parsonage of Calder when but 18 years of age. In 1601 he attended Lodowick duke of Lennox as his chaplain, in an embassy to the court of France for confirming the ancient amity between the two nations, and returned in the ambassador's retinue through England. When he entered into the archbishopric of Glasgow, he found there was not 100l. sterling of yearly revenue left; yet such was his care for his successors, that he greatly improved it, and much to the satisfaction of his diocese. After having filled this see 11 years, he was raised to that of St Andrew's in 1615, and made primate and metropolitan of all Scotland. He presided in several assemblies for restoring the ancient discipline, and bringing the church of Scotland to some degree of uniformity with that of England. He continued in high esteem with King James I. nor was he less valued by King

King Charles I. who was crowned by him in 1633, in the abbey-church of Holyroodhoufe. In 1635, upon the death of the earl of Kinnoul chancellor of Scotland, our primate was advanced to that poft; but had fcarcely held it four years, when the confufions beginning in Scotland, he was obliged to retire into England; and being broken with age, grief, and ficknefs, died at London in 1639, and was interred in Weftminfter-abbey. He wrote A Hiftory of the Church of Scotland from the year 203 to the reign of King James VI. in folio.

SPOUT, or *Water-Spout*. See *Water-Spout*.

Spout-Fifh. See Solen, Conchology *Index*.

SPRAT, Dr Thomas, bifhop of Rochefter, was born in 1636. He had his education at Oxford, and after the Reftoration entered into holy orders. He became fellow of the Royal Society, chaplain to George duke of Buckingham, and chaplain in ordinary to King Charles II. In 1667 he publifhed the Hiftory of the Royal Society, and a Life of Mr Cowley; who, by his laft will, left to his care his printed works and MSS. which were accordingly publifhed by him. In 1668 he was inftalled prebendary of Weftminfter; in 1680, was appointed canon of Windfor; in 1683, dean of Weftminfter; and in 1684, confecrated to the bifhopric of Rochefter. He was clerk of the clofet to King Jas. II.; in 1685, was made dean of the chapel royal; and the year following, was appointed one of the commiffioners for ecclefiaftical affairs. In 1692 his lordfhip, with feveral other perfons, was charged with treafon by two men, who drew up an affociation, in which they whofe names were fubfcribed declared their refolution to reftore King James; to feize the princefs of Orange, dead or alive; and to be ready with 30,000 men to meet King James when he fhould land. To this they put the names of Sancroft, Sprat, Marlborough, Salifbury, and others. The bifhop was arrefted, and kept at a meffenger's, under a ftrict guard, for eleven days. His houfe was fearched, and his papers feized, among which nothing was found of treafonable appearance, except one memorandum, in the following words: *Thorough-paced doctrine*. Being afked at his examination the meaning of the words, he faid that, about 20 years before, curiofity had led him to hear Daniel Burgefs preach; and that being ftruck with his account of a certain kind of doctrine, which he faid *entered at one ear, and pacing through the head went out at the other*, he had inferted the memorandum in his table-book, that he might not lofe the fubftance of fo ftrange a fermon. His innocence being proved, he was fet at liberty, when he publifhed an account of his examination and deliverance; which made fuch an impreffion upon him, that he commemorated it through life by an yearly day of thankfgiving. He lived to the 79th year of his age, and died May 20. 1713. His works, befides a few poems of little value, are. "The Hiftory of the Royal Society;" "The Life of Cowley;" "The Anfwer to Sorbiere;" "The Hiftory of the Rye-houfe Plot;" "The Relation of his own Examination;" and a volume of "Sermons." Dr Johnfon fays, "I have heard it obferved with great juftnefs, that every book is of a different kind, and that each has its diftinct and characteriftical excellence."

Sprat. See Clupea, Ichthyology *Index*.

SPRAY, the fprinkling of the fea, which is driven from the top of a wave in ftormy weather. It differs from fpoon-drift, as being only blown occafionally from the broken furface of a high wave; whereas the latter continues to fly horizontally along the fea, without intermiffion, during the excefs of a tempeft or hurricane.

SPRING, in *Natural Hiftory*, a fountain or fource of water rifing out of the ground.

Many have been the conjectures of philofophers concerning the origin of fountains, and great pains have been taken both by the members of the Royal Society and thofe of the Academy of Sciences at Paris, in order to afcertain the true caufe of it. It was Ariftotle's opinion, and held by moft of the ancient philofophers after him, that the air contained in the caverns of the earth, being condenfed by cold near its furface, was thereby changed into water; and that it made its way through, where it could find a paffage. But we have no experience of any fuch tranfmutation of air into water.

Thofe who imagine that fountains owe their origin to waters brought from the fea by fubterraneous ducts, give a tolerable account how they lofe their faltnefs by percolation as they pafs through the earth: but they find great difficulty in explaining by what power the water rifes above the level of the fea to near the tops of mountains, where fprings generally abound; it being contrary to the laws of hydroftatics, that a fluid fhould rife in a tube above the level of its fource. However, they have found two ways whereby they endeavour to extricate themfelves from this difficulty. The one is that of Des Cartes, who imagines, that after the water is become frefh by percolation, it is raifed out of the caverns of the earth in vapour towards its furface; where meeting with rocks near the tops of mountains in the form of arches or vaults, it fticks to them, and runs down their fides, (like water in an alembic), till it meets with proper receptacles, from which it fupplies the fountains. Now this is a mere hypothefis, without foundation or probability: for, in the firft place, we know of no internal heat of the earth to caufe fuch evaporation; or if that were allowed, yet it is quite incredible that there fhould be any caverns fo fmooth and void of protuberances as to anfwer the ends of an alembic, in collecting and condenfing the vapours together in every place where fountains arife. There are others (as Varenius, &c.) who fuppofe that the water may rife through the pores of the earth, as through capillary tubes by attraction. But hereby they fhow, that they are quite unacquainted with what relates to the motion of a fluid through fuch tubes: for when a capillary tube opens into a cavity at its upper end, or grows larger and larger, fo as to ceafe to be capillary at that end, the water will not afcend through that tube into the cavity, or beyond where the tube is capillary; becaufe that part of the periphery of the cavity, which is partly above the furface of the water and partly below it, is not of the capillary kind. Nay, if the cavity is continually fupplied with water, it will be attracted into the capillary tube, and run down it as through a funnel, if the lower end is immerged in the fame fluid, as in this cafe it is fuppofed to be.

It has been a generally received opinion, and much efpoufed by Mariotte (a diligent obferver of nature), that the rife of fprings is owing to the rains and melted fnow. According to him, the rain-water which falls upon the hills and mountains, penetrating the furface, meets

Spring. meets with clay or rocks contiguous to each other; along which it runs, without being able to penetrate them, till, being got to the bottom of the mountain, or to a confiderable diftance from the top, it breaks out of the ground, and forms fprings.

In order to examine this opinion, Mr Perrault, De la Hire, and D. Sideleau, endeavoured to make an eftimate of the quantity of rain and fnow that falls in the fpace of a year, to fee whether it would be fufficient to afford a quantity of water equal to that which is annually difcharged into the fea by the rivers. The refult of their inquiries was, that the quantity of rain and fnow which fell in a year into a cylindrical veffel would fill it (if fecured from evaporating) to the height of about nineteen inches. Which quantity D. Sideleau fhowed, was not fufficient to fupply the rivers; for that thofe of England, Ireland, and Spain, difcharge a greater quantity of water annually, than the rain, according to that experiment, is able to fupply. Befides which, another obfervation was made by them at the fame time, viz. that the quantity of water raifed in vapour, one year with another, amounted to about thirty-two inches, which is thirteen more than falls in rain: a plain indication that the water of fountains is not fupplied by rain and melted fnow.
